Executive Summary ES-1
ES.1 Introduction ES-1
ES.1.1 Proposed Project/Proposed Action Overview ES-1
ES.1.2 Location of the Proposed Project/Proposed Action ES-2
ES.1.3 Overview of the CEQA, NEPA, and Section 106 of NHPA Processes ES-3
ES.1.4 NASA & UC Berkeley Roles ES-6
ES.2 Purpose and Intended Use of this EIR/EIS ES-6
ES.3 Overview of Alternatives and Variant ES-6
ES.3.1 Project Variant ES-7
ES.3.2 Additional CEQA Alternatives ES-8
ES.4 CEQA Project Objectives ES-8
ES.5 NEPA Purpose and Need ES-9
ES.6 Summary of Environmental Impacts ES-10
ES.7 Significant Impacts ES-10
ES.8 Areas of Controversy ES-23
Chapter 1 **Introduction and Organization of Document 1-1**
1.1 CEQA and NEPA Lead Agencies 1-2
1.2 Purpose and Intended Use of this Joint EIR/EIS 1-3
1.2.1 Purpose of the EIR 1-3
1.2.2 Purpose of the EIS 1-4
1.2.3 Intended Uses of this Joint EIR/EIS 1-4
1.3 Public and Agency Involvement during the Environmental Review Process 1-6
1.3.1 California Environmental Quality Act Process 1-6
1.3.2 National Environmental Policy Act Process 1-8
1.3.3 Cooperating Agencies 1-10
1.3.4 Responsible Agencies 1-10
1.3.5 Trustee Agencies 1-11
1.4 Project Location 1-11
1.5 Selection of Alternatives 1-12
1.6 Thresholds of Significance 1-13
1.7 CEQA Project Objectives 1-14

1.8 NEPA Purpose and Need 1-14
1.9 Organization of Document 1-15
Chapter 2 **Proposed Project/Proposed Action and Alternatives 2-1**
2.1 Overview of Proposed Project/Proposed Action and Alternatives 2-1
2.2 Context 2-3
2.2.1 Project Location 2-3
2.2.2 Existing Conditions 2-8
2.2.3 Land Use Designations 2-11
2.3 Description of the Proposed Project/Proposed Action and Alternatives 2-12
2.3.1 Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines 2-16
2.3.2 Characteristics 2-24
2.3.3 Remediation 2-41
2.3.4 Construction 2-43
2.3.5 Transportation and Circulation 2-50
2.3.6 Utilities 2-61
2.3.7 Off-Site Utility Improvements and Demolition 2-82
2.4 Description of the No Student/Faculty Housing Variant/Sub-Alternative 2-82
2.5 Reviews and Approvals by Lead Agencies, Responsible Agencies, and Other Agencies 2-88
2.5.1 UC Regents Approvals 2-88
2.5.2 NASA Permits and Approvals 2-88
2.5.3 Reviews and Approvals by Responsible Agencies and Other Agencies 2-89
Chapter 3 **Affected Environment/Environmental Setting and Environmental Impacts 3-1**
3.1 Introduction 3-1
3.1.1 Organization of This Chapter 3-2
3.1.2 CEQA Methodology 3-2
3.1.3 No Student/Faculty Housing Variant/Sub-Alternative 3-3
3.1.4 Mitigation Measures 3-4
3.1.5 Significance Determinations 3-4
3.1.6 Approach to Cumulative Impacts Analysis 3-6
3.2 Aesthetics and Visual Resources 3.2-1
3.3 Air Quality 3.3-1
3.3.1 Introduction 3.3-1
3.3.2 Affected Environment/Environmental Setting 3.3-2
3.3.3 Plans, Policies, and Regulations 3.3-12
3.3.4 CEQA Findings 3.3-13

3.3.5 Thresholds of Significance 3.3-13
3.3.6 Methods for Analysis 3.3-16
3.3.7 Impacts and Mitigation Measures 3.3-20
3.3.8 Cumulative Impacts 3.3-112
3.4 Biological Resources 3.4-1
3.4.1 Introduction 3.4-1
3.4.2 Affected Environment/Environmental Setting 3.4-2
3.4.3 Plans, Policies, and Regulations 3.4-3
3.4.4 CEQA Findings 3.4-4
3.4.5 Thresholds of Significance 3.4-4
3.4.6 Methods for Analysis 3.4-5
3.4.7 Impacts Not Evaluated in Detail 3.4-5
3.4.8 Impacts and Mitigation Measures 3.4-6
3.4.9 Cumulative Impacts 3.4-37
3.5 Cultural Resources 3.5-1
3.5.1 Introduction 3.5-1
3.5.2 Affected Environment/Environmental Setting 3.5-1
3.5.3 Plans, Policies, and Regulations 3.5-24
3.5.4 CEQA Findings 3.5-25
3.5.5 Thresholds of Significance 3.5-25
3.5.6 Methods for Analysis 3.5-26
3.5.7 Impacts and Mitigation Measures 3.5-27
3.5.8 Cumulative Impacts 3.5-48
3.6 Energy 3.6-1
3.6.1 Introduction 3.6-1
3.6.2 Affected Environment/Environmental Setting 3.6-1
3.6.3 Plans, Policies, and Regulations 3.6-5
3.6.4 CEQA Findings 3.6-11
3.6.5 Thresholds of Significance 3.6-11
3.6.6 Methods for Analysis 3.6-11
3.6.7 Impacts and Mitigation Measures 3.6-13
3.6.8 Cumulative Impacts 3.6-25
3.7 Geology, Soils, and Paleontological Resources 3.7-1
3.7.1 Introduction 3.7-1
3.7.2 Affected Environment/Environmental Setting 3.7-1
3.7.3 Plans, Policies, and Regulations 3.7-9
3.7.4 CEQA Findings 3.7-11

3.7.5 Thresholds of Significance 3.7-12
3.7.6 Methods for Analysis 3.7-12
3.7.7 Impacts Not Evaluated in Detail 3.7-14
3.7.8 Impacts and Mitigation Measures 3.7-15
3.7.9 Cumulative Impacts 3.7-29
3.8 Greenhouse Gas Emissions 3.8-1
3.8.1 Introduction 3.8-1
3.8.2 Affected Environment/Environmental Setting 3.8-1
3.8.3 Plans, Policies, and Regulations 3.8-4
3.8.4 CEQA Findings 3.8-5
3.8.5 Thresholds of Significance 3.8-5
3.8.6 Methods for Analysis 3.8-7
3.8.7 Impacts and Mitigation Measures 3.8-9
3.8.8 Cumulative Impacts 3.8-36
3.9 Hazards and Hazardous Materials 3.9-1
3.9.1 Introduction 3.9-1
3.9.2 Affected Environment/Environmental Setting 3.9-2
3.9.3 Plans, Policies, and Regulations 3.9-21
3.9.4 CEQA Findings 3.9-32
3.9.5 Thresholds of Significance 3.9-33
3.9.6 Methods for Analysis 3.9-33
3.9.7 Impacts Not Evaluated in Detail 3.9-34
3.9.8 Impacts and Mitigation Measures 3.9-35
3.9.9 Cumulative Impacts 3.9-54
3.10 Hydrology and Water Quality 3.10-1
3.10.1 Introduction 3.10-1
3.10.2 Affected Environment/Environmental Setting 3.10-1
3.10.3 Plans, Policies, and Regulations 3.10-12
3.10.4 CEQA Findings 3.10-19
3.10.5 Thresholds of Significance 3.10-20
3.10.6 Methods for Analysis 3.10-20
3.10.7 Impacts Not Evaluated in Detail 3.10-21
3.10.8 Impacts and Mitigation Measures 3.10-22
3.10.9 Cumulative Impacts 3.10-44
3.11 Land Use and Planning 3.11-1
3.11.1 Introduction 3.11-1
3.11.2 Affected Environment/Environmental Setting 3.11-1

3.11.3 Plans, Policies, and Regulations 3.11-3
3.11.4 CEQA Findings 3.11-10
3.11.5 Thresholds of Significance 3.11-10
3.11.6 Methods for Analysis 3.11-11
3.11.7 Impacts Not Evaluated in Detail 3.11-11
3.11.8 Impacts and Mitigation Measures 3.11-12
3.11.9 Cumulative Impacts 3.11-26
3.12 Noise 3.12-1
3.12.1 Introduction 3.12-1
3.12.2 Affected Environment/Environmental Setting 3.12-1
3.12.3 Plans, Policies, and Regulations 3.12-15
3.12.4 CEQA Findings 3.12-16
3.12.5 Thresholds of Significance 3.12-16
3.12.6 Methods for Analysis 3.12-18
3.12.7 Impacts and Mitigation Measures 3.12-19
3.12.8 Cumulative Impacts 3.12-87
3.13 Population and Housing 3.13-1
3.13.1 Introduction 3.13-1
3.13.2 Affected Environment/Environmental Setting 3.13-1
3.13.3 Plans, Policies, and Regulations 3.13-10
3.13.4 CEQA Findings 3.13-11
3.13.5 Thresholds of Significance 3.13-11
3.13.6 Methods for Analysis 3.13-11
3.13.7 Impacts Not Evaluated in Detail 3.13-13
3.13.8 Impacts and Mitigation Measures 3.13-14
3.13.9 Cumulative Impacts 3.13-25
3.14 Public Services 3.14-1
3.14.1 Introduction 3.14-1
3.14.2 Affected Environment/Environmental Setting 3.14-1
3.14.3 Plans, Policies, and Regulations 3.14-4
3.14.4 CEQA Findings 3.14-6
3.14.5 Thresholds of Significance 3.14-7
3.14.6 Methods for Analysis 3.14-7
3.14.7 Impacts and Mitigation Measures 3.14-8
3.14.8 Cumulative Impacts 3.14-19

3.15 Recreation 3.15-1
3.15.1 Introduction 3.15-1
3.15.2 Affected Environment/Environmental Setting 3.15-1
3.15.3 Plans, Policies, and Regulations 3.15-3
3.15.4 CEQA Findings 3.15-4
3.15.5 Thresholds of Significance 3.15-5
3.15.6 Methods for Analysis 3.15-5
3.15.7 Impacts and Mitigation Measures 3.15-6
3.15.8 Cumulative Impacts 3.15-15
3.16 Transportation and Traffic 3.16-1
3.16.1 Introduction 3.16-1
3.16.2 Affected Environment/Environmental Setting 3.16-1
3.16.3 Plans, Policies, and Regulations 3.16-5
3.16.4 CEQA Findings 3.16-6
3.16.5 Thresholds of Significance 3.16-9
3.16.6 VMT Methods for Analysis 3.16-9
3.16.7 Impacts and Mitigation Measures 3.16-12
3.16.8 Cumulative Impacts 3.16-28
3.17 Tribal Cultural Resources 3.17-1
3.17.1 Introduction 3.17-1
3.17.2 Affected Environment/Environmental Setting 3.17-1
3.17.3 Plans, Policies, and Regulations 3.17-5
3.17.4 CEQA Findings 3.17-6
3.17.5 Thresholds of Significance 3.17-6
3.17.6 Methods for Analysis 3.17-7
3.17.7 Impacts and Mitigation Measures 3.17-7
3.17.8 Cumulative Impacts 3.17-12
3.18 Utility and Service Systems 3.18-1
3.18.1 Introduction 3.18-1
3.18.2 Affected Environment/Environmental Setting 3.18-2
3.18.3 Plans, Policies, and Regulations 3.18-6
3.18.4 CEQA Findings 3.18-16
3.18.5 Thresholds of Significance 3.18-16
3.18.6 Methods for Analysis 3.18-17
3.18.7 Impacts and Mitigation Measures 3.18-19
3.18.8 Cumulative Impacts 3.18-48

3.19 Effects Not Found to Be Significant 3.19-1
3.19.1 Aesthetics and Vehicular Parking Analysis 3.19-1
3.19.2 Agriculture and Forestry Resources 3.19-1
3.19.3 Mineral Resources 3.19-2
3.19.4 Wildfire 3.19-2
Chapter 4 **Environmental Impact Statement 4-1**
4.1 Introduction 4-1
4.1.1 Project Site and Vicinity 4-1
4.1.2 Project Overview 4-2
4.2 Purpose and Need 4-6
4.3 NEPA Scope and Review Process 4-7
4.3.1 Scope of the EIS 4-8
4.3.2 Agency Roles and Responsibilities and Decisions to Be Made 4-8
4.3.3 Public Participation 4-9
4.4 Project Alternatives 4-10
4.4.1 Introduction 4-10
4.4.2 Description of Alternatives 4-11
4.5 Affected Environment and Environmental Consequences 4-17
4.5.1 Introduction 4-17
4.5.2 Aesthetics and Visual Resources 4-41
4.5.3 Air Quality 4-47
4.5.4 Biological Resources 4-93
4.5.5 Cultural Resources 4-105
4.5.6 Energy 4-113
4.5.7 Geology, Soils, and Paleontological Resources 4-120
4.5.8 Hazards and Hazardous Materials 4-132
4.5.9 Hydrology and Water Quality 4-153
4.5.10 Land Use and Planning 4-165
4.5.11 Noise 4-168
4.5.12 Public Services 4-192
4.5.13 Recreation 4-202
4.5.14 Socioeconomics 4-211
4.5.15 Transportation and Traffic 4-224
4.5.16 Utility and Service Systems 4-240
4.5.17 Resource Topics Dismissed from Analysis 4-282

4.6 Other Required Disclosures 4-283
4.6.1 Short-Term Use of the Environment Versus Long-Term Productivity 4-283
4.6.2 Irreversible and Irretrievable Commitments of Resources 4-283
4.6.3 Growth-Inducing Effects 4-283
4.6.4 Required Federal Consultations 4-284
4.7 List of Preparers 4-284
Chapter 5 **Other CEQA Information and Alternatives 5-1**
5.1 Introduction 5-1
5.2 Significant Environmental Effects that Cannot Be Avoided 5-1
5.3 Irreversible Changes from Implementation of the CEQA Proposed Project and CEQA Reduced Density Alternative 5-10
5.3.1 CEQA Proposed Project and the No Student/Faculty Housing Variant 5-10
5.3.2 CEQA Reduced Density Alternative and the No Student/Faculty Housing Variant 5-12
5.4 Growth-Inducing Impacts of the CEQA Proposed Project 5-13
5.4.1 Short-Term Employment Opportunities 5-14
5.4.2 Permanent Employment Opportunities 5-14
5.4.3 Removal of an Obstacle to Additional Growth 5-16
5.5 Additional CEQA Alternatives 5-16
5.5.1 Introduction 5-16
5.5.2 Range of Reasonable Alternatives 5-17
5.5.3 Project Objectives 5-18
5.5.4 Description of Additional CEQA Alternatives Selected for Evaluation 5-19
5.5.5 Attainment of Project Objectives under Project Alternatives 5-23
5.5.6 Alternatives Considered but Rejected 5-27
5.5.7 Additional CEQA Alternatives Impact Assessment 5-35
5.5.8 Comparison of Impacts of the CEQA Proposed Project Alternatives and Variant 5-73
5.5.9 Environmentally Superior Alternative 5-85
Chapter 6 **Submitted Alternatives, Information and Analyses, Scoping Comments, and Areas of Controversy 6-1**
6.1 Scoping Comments 6-1
6.2 Areas of Controversy and Information and Analyses Provided 6-1
Project Description (CEQA and NEPA) 6-1
Air Quality (CEQA and NEPA) 6-2
Biological Resources (CEQA and NEPA) 6-2
Cultural Resources (CEQA and NEPA), Tribal Cultural Resources (CEQA), and Section 106 (NEPA) 6-2

Energy (CEQA) 6-3
Greenhouse Gas Emissions (CEQA and NEPA)/Climate Change (CEQA) 6-3
Hazards and Hazardous Materials (CEQA and NEPA) 6-3
Hydrology and Water Quality (CEQA and NEPA) 6-4
Land Use (CEQA and NEPA) 6-4
Population and Housing (CEQA)/Socioeconomics (NEPA) 6-4
Public Services (CEQA and NEPA) 6-4
Transportation and Traffic (CEQA and NEPA) 6-4
Utilities and Service Systems (CEQA and NEPA) 6-5
Other 6-5
6.3 Submitted Alternatives 6-6
Chapter 7 **References 7-1**
Chapter 8 **Preparers List 8-1**
Chapter 9 **Descriptions of Figures 9-1**

Appendix 1-1 Scoping Report
Appendix 2-1 Proposed Master Plan, Development Guidelines, and Standards
Appendix 2-2 Environmental Issues Management Plan
Appendix 2-3 Temporary Traffic Control Plan Procedures
Appendix 2-4 Proposed Transportation Demand Management Plan
Appendix 3.2-1 Aesthetics and Visual Resources CEQA Evaluation
Appendix 3.3-1 Air Quality, Health Risk Analysis, and Greenhouse Gas Emissions Technical Report
Appendix 3.4-1 Biological Resources Technical Report
Appendix 3.4-2 Preliminary Aquatic Resources Delineation Report
Appendix 3.5-1 Cultural Resource Inventory Report
Appendix 3.7-1 Preliminary Geotechnical Evaluation
Appendix 3.9-1 Hazardous Material Conditions
Appendix 3.12-1 Noise and Vibration Technical Report
Appendix 3.16-1 Transportation Analysis
Appendix 3.18-1 Water Supply Evaluation
Appendix 4-1 Socioeconomics Technical Report
Appendix 5-1 Detailed Analysis of Proposed Tribal Alternatives (Confidential)

Glossary

Each technical report included as an appendix to this joint EIR/EIS includes a glossary; refer to those technical reports for terms specific to those topics.

Ames Research Center Directives and Procedural Requirements (APR) – The Ames Research Center Directives and APR are a public listing of National Aeronautics and Space Administration Ames Research Center (NASA ARC) policies and procedures. These policies ensure compliance with NASA's standards and authorize review, assessment, and approval of projects at NASA ARC. The policies also address NASA ARC's conformance with federal, state, and local land use plans and regulations.

Bicycle Lane (Class II facility) – A corridor expressly reserved for bicycles, existing on a street or roadway in addition to any lanes for use by motorized vehicles.

Bicycle Path (Class I facility) – A paved route not on a street or roadway and expressly reserved for bicycles traversing an otherwise unpaved area. Bicycle paths may parallel roads but typically are separated from them by landscaping.

Bicycle Route (Class III facility) – A facility shared with motorists and identified only by signs, a bicycle route has no pavement markings or lane stripes.

California Environmental Quality Act (CEQA) – California law signed in 1970 that requires State and local government agencies to inform decision-makers and the public about the potential environmental impacts of proposed projects and reduce those environmental impacts to the extent feasible.

California Register of Historical Resources (CRHR) - The State Historical Resources Commission designed this program for use by state and local agencies, private groups and citizens to identify, evaluate, register and protect California's historical resources. The CRHR is the authoritative guide to the state's significant historical and archeological resources.

Congestion Management Plan (CMP) – A mechanism employing growth management techniques, including traffic level of service requirements, standards for public transit, trip reduction programs involving transportation systems management and jobs/housing balance strategies, and capital improvement programming, for the purpose of controlling and/or reducing the cumulative regional traffic impacts of development. Assembly Bill 1791, effective August 1, 1990, requires all cities, and counties that include urbanized areas, to adopt by December 1, 1991, and annually update a Congestion Management Plan.

Earthquake Fault Zone – The State of California, Alquist-Priolo Earthquake Fault Zoning Act identifies sites within 1,000 foot wide zone with the fault at the center as Earthquake Fault Zones. The Alquist-Priolo Act requires that these sites undergo specialized geologic investigations prior to approval of certain new development. State law requires that these zones be incorporated into local general plans.

Environmental Impact Report (EIR) – A report required by the California Environmental Quality Act and which assesses all the environmental characteristics of an area and determines what effects or impacts will result if the area is altered or disturbed by a proposed action. (See "California Environmental Quality Act.")

Environmental Impact Statement (EIS) – A report prepared pursuant to the National Environmental Policy Act and is an evaluation of the environmental effects of a federal action including its alternatives. The public, other federal agencies, and outside parties may provide input into the preparation of an EIS and then comment on the draft EIS when it is published. (See " National Environmental Policy Act.")

Erosion – (1) The loosening and transportation of rock and soil debris by wind, rain, or running water. (2) The gradual wearing away of the upper layers of earth.

Exclusive Federal Jurisdiction – The federal government alone has jurisdiction and provides law enforcement and public safety services.

Expansive Soils – Soils that swell when they absorb water and shrink as they dry.

Fault – A fracture in the earth's crust forming a boundary between rock masses that have shifted.

Flood Insurance Rate Map (FIRM) – For each community, the official map on which the Federal Insurance Administration has delineated areas of special flood hazard and the risk premium zones applicable to that community.

Flood, 100-Year – The magnitude of a flood expected to occur on the average every 100 years, based on historical data. The 100-year flood has a 1/100, or one percent, chance of occurring in any given year.

Geological – Pertaining to rock or solid matter.

Geomorphic Province – A region with distinctive landforms, rock types, and geologic structure.

Grade – The average level of the finished surface of the ground adjacent to the exterior walls of the building.

Groundwater – Water under the earth's surface, often confined to aquifers capable of supplying wells and springs.

Hazardous Waste – Any refuse or discarded material or combinations of refuse or discarded materials in solid, semisolid, liquid, or gaseous form which cannot be handled by routine waste management techniques because they pose a substantial present or potential hazard to human health or other living organisms because of their chemical, biological, or physical properties.

Household – All those persons related or unrelated who occupy a single housing unit.

Institutional Shared Pool (ISP) – The ISP is the mechanism by which NASA charges its tenants for costs for common levels of services provided throughout its Property on an annual basis (e.g., security and law enforcement, fire department response and inspections, emergency medical response, first responder operations, common grounds [including recreational areas], roads, and infrastructure maintenance and repairs), and additional demand services above the common levels of service.

Jobs/Housing Balance – The availability of affordable housing for employees.

Jobs/Housing Ratio – The jobs/housing balance divides the number of jobs in an area by the number of employed residents. A ratio of 1.0 indicates a balance. A ratio greater than 1.0 indicates a net in-commute; less than 1.0 indicates a net out-commute.

Lead Agency – A lead agency is the public agency that has the principal responsibility for carrying out or approving a project that is subject to CEQA or NEPA. For this project, NASA is the NEPA Lead Agency for the proposed action. The UC Regents is the CEQA Lead Agency for the proposed project.

LEED – The LEED (Leadership in Energy and Environmental Design) Green Building Rating System™ is a voluntary, consensus-based national standard for developing high-performance, sustainable buildings.

Level of Service (LOS) Standard, Traffic – A scale that measures the amount of traffic that a roadway or intersection can accommodate, based on such factors as maneuverability, driver dissatisfaction, and delay.

LOS A – Indicates a relatively free flow of traffic, with little or no limitation on vehicle movement or speed.

LOS B – A steady flow of traffic, with only slight delays in vehicle movement and speed.

LOS C – A reasonably steady, high-volume flow of traffic, with some limitations on vehicle movement and speed, and occasional backups on critical approaches.

LOS D – Designates where the level of traffic nears an unstable flow. Intersections still function but short queues develop and cars may have to wait through one cycle during short peaks.

LOS E – Traffic characterized by slow movement and frequent (although momentary) stoppages. This type of congestion is considered severe, but is not uncommon at peak hours, with frequent stopping, longstanding queues, and blocked intersections.

LOS F – Represents unsatisfactory stop-and-go traffic characterized by "traffic jams" and stoppages of long duration. Vehicles at signalized intersections usually have to wait through one or more signal changes, and "upstream" intersections may be blocked by the long queues.

Limits of Work – The Project Site (39 acres) plus the Off-Site Areas (6-acre area outside of the Project Site where utility improvements and building demolition would take place).

Liquefaction – The transformation of loose water saturated granular materials (such as sand or silt) from a solid into a liquid state. A type of ground failure that can occur during an earthquake.

Mitigation – As defined in the CEQA Guidelines, "Mitigation" includes:

- Avoiding the impact altogether by not taking a certain action or parts of an action.
- Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- Compensating for the impact by replacing or providing substitute resources or environments.

NASA Ames Development Plan (NADP) – The NADP is a comprehensive long-range land use plan that guides the use, renovation, management, and development of facilities at National Aeronautics and Space Administration Ames Research Center. (See "National Aeronautics and Space Administration Ames Research Center.")

National Aeronautics and Space Administration Ames Research Center (NASA ARC) - An approximately 2,000-acre facility in unincorporated Santa Clara County, California, between U.S. 101

and the southwest edge of San Francisco Bay. Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction.

National Environmental Policy Act (NEPA) – Federal law signed in 1970 requiring federal agencies to analyze and disclose the environmental impacts of proposed actions before they are undertaken.

National Pollutant Discharge Elimination System (NPDES) – The national program for controlling discharges of pollutants from point sources (e.g., municipal sewage treatment plants, industrial facilities) into the waters of the United States.

National Historic Preservation Act (NHPA), Section 106 – Archaeological and architectural resources (buildings and structures) are protected through the NHPA (16 United States Code 470f), the Archaeological and Historic Preservation Act of 1974, and the Archaeological Resources Protection Act of 1979. Section 106 of the NHPA requires project review of effects on historical properties only when projects involve federal funding or permitting or occur on federal land; therefore, it is not applicable to discretionary actions on privately owned land at the municipal level. However, the NHPA establishes the National Register of Historic Places, which provides a framework for resource evaluation and informs the process for determining impacts on historical resources under CEQA.

National Register of Historic Places (NRHP) – The listing maintained by the US National Park Service of sites and structures that have been designated as historically significant.

Open Space – Land and water areas retained for use as active or passive recreation areas or for resource protection in an essentially undeveloped state.

Parking Ratio – The number of parking spaces provided per 1,000 square of floor area, e.g., 2:1 or "two per thousand."

Project Site – 39-acre site where the proposed project would be implemented. The Project Site is bounded by Wescoat Road to the north and Cody Road to the east. The southern boundary of the Project Site is between Edquiba Road and Girard Road. The western boundary of the Project Site is within an empty lot immediately west of Bailey Road.

Proposed project/proposed action – Berkeley Space Center at the National Aeronautics and Space Administration (NASA) Research Park. The proposed project will include the proposed Berkeley Space Center Master Plan (Master Plan), which establishes the overall project vision, conceptual plans, and illustrative renderings, and the proposed Berkeley Space Center Development Guidelines (Development Guidelines), which provide Maximum and Minimum Development Parameters and Standards for the proposed project buildings and open space.

Regional Housing Needs Allocation (RHNA) – The State of California mandated process that determines the number of housing units, by income level, a region's local governments must plan for over an 8-year cycle. The Association of Bay Area Governments manages the local RHNA process**.**

Remediation – The action or measures taken, or to be taken, to lessen, clean-up, remove, or mitigate the existence of hazardous materials existing on the property to such standards, specifications, or requirements as may be established or required by federal, state, or county statute, rule, or regulation.

Responsible Parties – The parties held responsible for the remediation of a site.

Record of Decision (ROD) – The signed document that adopts the preferred alternative described in the EIS, and commits NASA and its partners to implementation of the mitigation measures.

Runoff – That portion of rain or snow that does not percolate into the ground and is discharged into streams instead.

Sediments – Soil, sand, and minerals eroded from land by water or air. Sediments settle to the bottom of surface water.

Seiche – An earthquake generated wave in an enclosed body of water such as a lake, reservoir, or bay.

Seismic – Caused by or subject to earthquakes or earth vibrations.

Seismic Hazard Zone – The State of California, Seismic Hazards Mapping Act identifies areas within the state where landslides and liquefaction are most likely to occur. The Act requires special investigation of these sites before some types of buildings may be constructed. Property owners must disclose that property lies within such a zone at the time of sale.

Shared Use Streets – These streets would not include formal distinctions for spaces that would be used by vehicles and bicyclists. Shared Use Streets would include shared-use markings for bike and vehicular uses as well as pedestrian sidewalks.

Slope – Land gradient described as the vertical rise divided by the horizontal run, and expressed in percent.

Solid Waste – Any unwanted or discarded material that is not a liquid or gas. Includes organic wastes, paper products, metals, glass, plastics, cloth, brick, rock, soil, leather, rubber, yard wastes, and wood, but does not include sewage and hazardous materials. Organic wastes and paper products comprise about 75 percent of typical urban solid waste.

Socioeconomics – The human-level elements that may be affected by a project. These categories can include topics such as relocation, available jobs, resulting economic changes, and local demographics.

Spring 2026 Project-Specific Environmental Issues Management Plan (EIMP) – Provides the framework to redevelop the Premises and Off-Site Areas in a manner that is protective of human health and the environment. EIMP includes minimum design considerations for new construction, risk management measures to be implemented during construction within the Limits of Work, post-construction risk management procedures for future subsurface activities within the Limits of Work, as well as procedures for long-term compliance with the EIMP and other regulatory requirements.

State Historic Preservation Officer (SHPO) – The official appointed or designated pursuant to Section 10(b)(1) of the NHPA to administer the State historic preservation program or a representative designated to act for the State historic preservation officer.

State Implementation Plan (SIP) – A detailed description of the programs a state will use to carry out its responsibilities under the Clean Air Act. State implementation plans are collections of the regulations used by a state to reduce air pollution. The Clean Air Act requires that EPA approve each state implementation plan. Members of the public are given opportunities to participate in review and approval of state implementation plans.

Surface Water – All water open to the atmosphere (e.g., rivers, lakes, reservoirs, streams, impoundments, seas, estuaries) and all springs, wells, or other collectors that are directly influenced by surface water.

Transportation Demand Management (TDM) – The implementation of programs, plans or policies designed to encourage changes in individual travel behavior. TDM can include alternatives to the single occupant vehicle such as carpools, vanpools, bicycles, transit, reduction or elimination of the number of vehicle trips, or shifts in the time of vehicle commutes to other than the peak period.

Trip Generation – The dynamics that account for people making trips in automobiles or by means of public transportation. Trip generation is the basis for estimating the level of use for a transportation system and the impact of additional development or transportation facilities on an existing, local transportation system.

Tsunami – A large ocean wave generated by an earthquake in or near the ocean.

Uniform Building Code (UBC) – A national, standard building code that sets forth minimum standards for construction.

United States Environmental Protection Agency (U.S. EPA) – An independent agency of the federal government that protects people and the environment from significant health risks, sponsors and conducts research, and develops and enforces environmental regulations. The U.S. Environmental Protection Agency is the lead air quality agency for the United States.

Unique Archaeological Resource – CEQA, Section 21083.2(g) defines "unique archaeological resources" as "any archaeological artifact, object, or site about which it can be clearly demonstrated that it contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information, it has a special and particular quality such as being the oldest of its type or the best available example of its type or it is directly associated with a scientifically recognized prehistoric or historic event."

Unique Paleontological Resource – CEQA does not define a "unique Paleontological Resource" however, the California Public Resource Code section 5097.2. discusses paleontological sites in the following terms, "lands [which] may contain any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological sites, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature."

Vehicle Miles Traveled (VMT) – A metric for assessing passenger vehicle-related impacts that focuses on the total amount of driving to promote the reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses. VMT is a metric used for CEQA analysis.

View Corridor – The line of sight identified as to height, width, and distance of an observer looking toward an object of significance to the community (e.g., ridgeline, river, historic building, etc.); the route that directs the viewer's attention.

Viewshed – The area within view from a defined observation point.

Wastewater – The spent or used water from individual homes, a community, a farm, or an industry that often contains dissolved or suspended matter.

Wetlands – Habitats where the influence of surface or groundwater has resulted in development of plant or animal communities adapted to aquatic or intermittently wet conditions. Wetlands include tidal flats, shallow subtidal areas, swamps, marshes, wet meadows, bogs, and similar areas**.**

ES.1 Introduction

Moffett Partners, LLC (Project Proponent), a joint venture of The Regents of the University of California (UC Regents) and SKSP NRP, LLC, is proposing a master-planned mixed-use academic and research project, referred to as the Berkeley Space Center at the National Aeronautics and Space Administration (NASA) Research Park (NRP) (proposed project/proposed action).[1] The Project Proponent will require authorization from the UC Regents to proceed with the proposed project under the California Environmental Quality Act (CEQA) and NASA's approval to proceed following analysis consistent with the National Environmental Policy Act (NEPA). NASA is the NEPA Lead Agency for the proposed action and, as the Authority Having Jurisdiction, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. The UC Regents is the CEQA Lead Agency for the proposed project and would provide authorization before the proposed action is submitted for NASA's approval.[2]

The University of California, Berkeley (UC Berkeley) (on behalf of UC Regents) and NASA are preparing this joint environmental impact report/environmental impact statement (joint EIR/EIS) to assess potential environmental impacts that could result from the implementation of the proposed project.[3]

State CEQA Guidelines Section 15123 identifies the required contents for an EIR executive summary, which includes a brief summary of the proposed actions and its consequences, each significant effect, proposed mitigation measures, alternatives that would reduce or avoid significant effects, and known areas of controversy. This information is provided in subsequent sections. While there are no specific requirements for the format of an EIS, this executive summary also summarizes the NEPA evaluation contained in this document.

ES.1.1 Proposed Project/Proposed Action Overview

The proposed project under consideration by NASA (i.e., the proposed action) would include academic and research facilities, consisting of offices, laboratories, research-and-development (R&D) uses, and related amenities (collectively, "Research and Office Uses"); conference center and related amenities ("Conference Uses"); ground-floor retail, food and beverage, maker spaces (i.e., collaborative work spaces for using various tools and materials), and other complementary accessory uses that would be publicly accessible (collectively, "Active Uses"); student/faculty housing, including associated amenities ("Student/Faculty Housing"); short-term lodging, including associated amenities ("Short-Term Lodging"); transportation networks; and open spaces, as well as landscaped spaces, to create a state-of-the-art research and education hub that shapes the future of technology and innovation and advance the UC Regents educational, scientific research, charitable,

1 Throughout this joint environmental impact report/environmental impact statement (joint EIR/EIS), *proposed project* refers to both the proposed project (under the California Environmental Quality Act) and the proposed action (under the National Environmental Policy Act).

2 UC Regents is a legal entity that includes all of the University of California campuses.

3 Throughout this joint EIR/EIS, the discussion of the CEQA Proposed Project and each CEQA alternative (other than the CEQA No Project/Existing Conditions Alternative) also applies to the corresponding Build Alternative under NEPA.

and other exempt purposes (within the meaning of Section 501(c)(3) of the United States Internal Revenue Code). The proposed open space would include pathways, activated uses (e.g., occupied areas that pedestrians could access via sidewalks or pathways), and passive uses (e.g., open lawns, patios). The proposed project would facilitate the development and long-term operation of a collaborative research environment at the National Aeronautics and Space Administration Ames Research Center (NASA ARC) that supports NASA's position at the forefront of technological innovation and as a catalyst for space and aeronautical research.

The UC Regents will consider approving the submittal of the Project Proponent's application to NASA, an action that requires review pursuant to CEQA.[4] The Project Proponent's application proposes 2.3 million square feet of mixed-use academic and research uses, which is the proposed project under CEQA (i.e., the CEQA Proposed Project).

ES.1.2 Location of the Proposed Project/Proposed Action

The proposed project would be located at NASA ARC, as depicted in Figure 2-1, Project Location, on an approximately 39-acre Project Site (Project Site), along with approximately 6 acres of off-site areas (Off-Site Areas) where utility improvements and building demolition would take place. Together, the Project Site and Off-Site Areas comprise the approximate 45-acre limits of work (Limits of Work), as depicted in Figure 2-2, Limits of Work, in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, and as more fully described below.

The Limits of Work are located primarily on federal land within NASA ARC, an approximately 2,000-acre facility in unincorporated Santa Clara County, California, between U.S. 101 and the southwest edge of San Francisco Bay. A small portion of the Off-Site Areas is on federal land owned by the United States Army (Army). The city of Mountain View borders NASA ARC to the north and southwest, and the city of Sunnyvale borders NASA ARC to the southeast and east. NASA ARC is approximately 33 miles south of the city of San Francisco and 8 miles north of the city of San José.

The Project Site is within the City of Mountain View Sphere of Influence but outside of any city's jurisdictional limits. Most of the Off-Site Areas are also within the City of Mountain View Sphere of Influence and outside of any city's jurisdictional limits, with the exception of the northern portion and the southwestern portion, which are within the city of Mountain View. The Project Site is bounded by Wescoat Road to the north and Cody Road to the east,[5] as depicted in Figure 2-3, Existing Conditions (Project Site), in Chapter 2. The southern boundary of the Project Site is between Edquiba Road and Girard Road. The western boundary of the Project Site is within an empty lot immediately west of Bailey Road. The Project Site is a portion of Santa Clara County Assessor's Parcel Number 116-18-012.

The Limits of Work are currently developed with 18 one- to three-story buildings that total approximately 185,600 square feet (including approximately 132,500 square feet of vacant uses and

[4] The application will include the proposed Berkeley Space Center Master Plan (Master Plan) provided in Appendix 2-1 of this joint EIR/EIS, which establishes the overall project vision, conceptual plans, and illustrative renderings, and the proposed Berkeley Space Center Development Guidelines (Development Guidelines) provided in Appendix 2-1 of this joint EIR/EIS, which provide strategies for the proposed buildings and landscapes within a flexible framework (as further discussed in Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*).

[5] Cody Road would be realigned to the east as part of the proposed project and would be the eastern boundary of the Project Site.

approximately 53,100 square feet of occupied uses), along with surface parking lots, roadways, and utility infrastructure, as depicted in Figure 2-4, Existing Conditions Site Plan (Limits of Work), in Chapter 2. The existing buildings are mostly vacant; many were formerly used as ancillary buildings that supported Navy operations (e.g., offices, food service, a gas station, pool, recreation center, and lodging). The other existing buildings within the Limits of Work comprise industrial, storage, and utility facilities. The buildings range in height from approximately 15 to 45 feet above the finished grade. In addition, there are approximately 900 existing parking spaces within the Limits of Work. As of mid-2024, approximately 42 people were employed within the Limits of Work; no full-time residents or short-term occupants (e.g., summer interns) lived within the Limits of Work.

ES.1.3 Overview of the CEQA, NEPA, and Section 106 of NHPA Processes

ES.1.3.1 CEQA Process

The CEQA process is initiated with public scoping and the notice of preparation (NOP). The term *scoping* refers to the process used to assist the lead agency in determining the focus and content of an EIR. Scoping solicits input on the potential topics to be addressed in an EIR, the range of project alternatives, and possible mitigation measures. In compliance with CEQA Section 21080.4, the scoping process for this EIR was initiated when the NOP was released for the proposed project on June 21, 2024 for a 30-day public review period through July 22, 2024. Public scoping meetings were held via Zoom on July 10, 2024, and July 15, 2024. The purpose of the NOP was to allow various private and public entities to transmit their concerns and comments on the scope and content of this EIR, focusing on specific information related to each individual's or group's interest or agency's statutory responsibility early in the environmental review process

Following the close of the 30-day NOP public scoping period, this Draft EIR was prepared (refer to Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, of this joint EIR/EIS). As stated in the CEQA Guidelines, an EIR is an informational document. It is intended to inform public agency decision makers and the public of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to a project. The purpose of this Draft EIR is to provide UC Regents responsible and trustee agencies, other public agencies, and the public with detailed information about the environmental effects that could result from the proposed project; examine and set forth feasible methods of mitigating any adverse environmental impacts should the project be approved; and consider feasible alternatives to the proposed project. UC Berkeley must provide public notice of availability of this Draft EIR to interested individuals, agencies, and organizations to review and comment on the document prior to being finalized. This Draft EIR must be distributed for a 45-day (minimum) public review and comment period. Readers are invited to submit written comments on the document and are encouraged to be as specific as possible and address either the adequacy of the EIR or the merits of the alternatives considered.

Following the close of the 45-day public review period, UC Berkeley will prepare responses to all substantive comments related to potential physical changes to the environment. The Draft EIR, along with the written and oral substantive comments received during the review period, as well as responses to those comments, will make up the Final EIR. All responses to comments submitted on

the Draft EIR by public agencies will be provided to those agencies at least 10 days before certification of the EIR.

The Final EIR (consisting of the Draft EIR and the responses to comments) will be considered by the UC Regents to certify the Final EIR and then approve or deny the proposed project application. NASA is the final decision-making body regarding the project-specific discretionary development entitlements. Additionally, when a public agency approves a project evaluated under CEQA in the form of an EIR, CEQA requires that the public agency adopt a mitigation monitoring and reporting program to ensure that the mitigation measures identified in the EIR are implemented. The mitigation monitoring and reporting program will be considered by the UC Regents in conjunction with the Final EIR and will be included as part of the final proposed project application that is submitted to NASA for approval. Because the UC Regents is not constructing the proposed project and does not have jurisdiction over NASA ARC, the oversight of implementation of the mitigation measures by the developer lies with NASA.

Certification of the Final EIR by the UC Regents as complete and adequate, in conformance with CEQA, does not grant any land use approvals or entitlements for the proposed project. The merits of the proposed project application will be considered by the UC Regents following certification of the Final EIR/EIS. The CEQA Guidelines require that, for one or more significant and unavoidable impacts that cannot be substantially mitigated, a lead agency must prepare a Statement of Overriding Considerations that balances the social, economic, technological, and legal benefits of approving a project against the significant and unavoidable environmental impacts that would result from project implementation. If significant and unavoidable impacts are identified, the UC Regents will consider the Statement of Overriding Considerations for the proposed project application.

ES.1.3.2 NEPA Process

Because the proposed action would be located on federal land, it must comply with NEPA, and because the proposed action may have a reasonably foreseeable significant effect on the quality of the human environment an EIS must be prepared. As described above, this EIS has been prepared in accordance with NEPA.

The scoping process for the EIS was initiated when the notice of intent (NOI) was released for the proposed action from June 25, 2024 for a 30-day public review period through July 26, 2024. Public scoping meetings were held via Zoom on July 10, 2024, and July 15, 2024. In addition, the NOI was published in the *Federal Register* on June 26, 2024, under Docket Number NASA-24-039. Scoping allowed various private and public entities to transmit their concerns and comments on the scope and content of this EIS, identify significant issues, and provide input on alternatives).

After the public scoping period, this Draft EIS was prepared (refer to Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS). The primary purpose of an EIS is to ensure that federal agencies consider the environmental impacts of their actions and inform decision-makers and the public of reasonably foreseeable environmental effects and a reasonable range of project alternatives. An EIS provides information regarding the purpose and need for the proposed action, describes the affected environment, significant effects and reasonable alternatives that are technically and economically feasible and meet the purpose and need of the proposed action.

NASA provided a public notice of availability of this Draft EIS to interested individuals, agencies, and organizations to review and comment on alternatives or impacts prior to being finalized. This Draft

EIS document will be distributed for a 45-day public review and comment period. Readers are invited to submit written comments, and are encouraged to be as specific as possible about the alternatives presented or the range of the analysis considered. In addition, the document will be made available through the *Federal Register.*

Following the close of the 45-day public review period, NASA will prepare responses to all substantive comments related to potential environmental effects and alternatives. A Final EIS will be prepared and consist of the (1) the Draft EIS, (2) a list of individuals, organizations, or agencies that provided comments on the Draft EIS, (3) comments received on the Draft EIS during the public comment period, (4) responses to the comments provided on the Draft EIS, and (5) and clarification of errors, omissions, or misinterpretation of the discussion in the findings in the Draft EIS by NASA. The Final EIS will be published on NASA's project website and accessible to the public.

After the Final EIS is published, NASA will prepare a written record explaining why NASA has chosen to undertake a proposed action, identifying what the proposed action is, and any mitigation identified in the joint EIR/EIS that NASA is including. The Mitigation Monitoring and Reporting Program details the mitigation and assigns responsibility for their implementation; the final Mitigation Implementation and Monitoring Plan will also be prepared by NASA.

The National Historic Preservation Act (NHPA) mandates that federal agencies consider the effects of projects on historic properties and seek comments on their actions from an independent reviewing agency, the State Historic Preservation Office (SHPO) and/or the Advisory Council on Historic Preservation (ACHP). Title 36 of the Code of Federal Regulations provides the methodology for assessing impacts on historic properties and details the requirements of the consultation process. For complex projects and programs expected to continue over time, the Section 106 regulations allow development of a Programmatic Agreement (PA) that governs ongoing and future activities undertaken as part of the project or program it addresses. An agency may fulfill its obligations under Section 106 by following the alternate review process outlined in a PA. NASA, in consultation with the Advisory Council on Historic Preservation, the National Conference of State Historic Preservation Officers, and other consulting parties, developed the NASA-Wide Programmatic Agreement (NPA) as a Section 106 program alternative pursuant to 36 CFR 800.14(b). Executed in October 2025, the NPA governs NASA's implementation of alternate procedures for project review and the resolution of adverse effects on historic properties under Section 106. Historic properties and impacts to them are analyzed in Section 4.5.5, *Cultural Resources*, in this joint EIR/EIS. NASA will use the process described in the NPA to satisfy its obligations under Section 106.

ES.1.3.3 Joint EIR/EIS Process

The joint Draft EIR/EIS will be circulated together, approximately at the same time, for a 45-day (minimum) public review and comment period. As outlined above, following the close of the 45-day public review period, NASA and UC Berkeley will prepare responses to all substantive comments related to potential environmental effects and alternatives. The joint Final EIR/EIS will be distributed to federal agencies with jurisdiction by law or special expertise, state and local cooperating agencies, environmental regulatory agencies, and those requesting copies.

ES.1.4 NASA & UC Berkeley Roles

NASA is the NEPA Lead Agency for the proposed action. As the Authority Having Jurisdiction, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. The UC Regents is the CEQA Lead Agency for the proposed project application and would provide authorization, including certification of the joint EIR/EIS under CEQA before the proposed action is submitted for NASA's approval.[6] UC Berkeley (on behalf of UC Regents) and NASA are preparing this joint EIR/EIS for the proposed project.

ES.2 Purpose and Intended Use of this EIR/EIS

The purpose of this joint EIR/EIS is to assess and disclose the potential environmental impacts associated with adoption and implementation of the project and to determine corresponding mitigation measures as necessary. The project is evaluated at a detailed project level in this joint EIR/EIS and is intended to be relied upon by UC Berkeley and NASA to provide CEQA and NEPA clearance, respectively, for approval and entitlement of the proposed project. This joint EIR/EIS is also intended to provide CEQA and NEPA clearance for review, approvals, or actions by other agencies or entities, as listed in Section 2.5, *Reviews and Approvals by Lead Agencies, Responsible and Other Agencies*, in Chapter 2.

ES.3 Overview of Alternatives and Variant

In accordance with CEQA and the CEQA Guidelines, specifically Section 15126.6, an EIR must describe a reasonable range of alternatives to a project, or the location of a project, that could attain most of the project objectives while avoiding or substantially lessening any of the significant effects of the project. The range of alternatives required in an EIR is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. CEQA states that an EIR should not consider alternatives "whose effects cannot be ascertained and whose implementation is remote and speculative."

NEPA requires an EIS to consider "a reasonable range of alternatives to the proposed agency action, including an analysis of any negative environmental impacts of not implementing the proposed agency action in the case of a no action alternative, that are technically and economically feasible, and meet the purpose and need of the proposal".

UC Berkeley and NASA are preparing this joint EIR/EIS for the proposed project. Pursuant to NEPA requirements, NASA identified two build alternatives to meet the purpose and need for the proposed action including the majority of the project's objectives (see Section ES.4, *CEQA Project Objectives*). The joint EIR/EIS also discusses the NEPA No-Action Alternative. Therefore, pursuant to NEPA, this joint EIR/EIS evaluates the following alternatives at an equal level of detail:

- **CEQA Proposed Project (NEPA Build Alternative 1)**, which would create approximately 2.3 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. The CEQA Proposed Project would include approximately 2 million square feet for Research and Office Uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 130,000

[6] UC Regents is a legal entity that includes all of the University of California campuses.

square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging. Only the CEQA Proposed Project includes the Water Reuse Facility (WRF) Option and the Central Utility Plant (CUP) Option.[7]

- **CEQA Reduced Density Alternative (NEPA Build Alternative 2)**, which would create approximately 1.4 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. Compared to the CEQA Proposed Project, the CEQA Reduced Density Alternative would provide less space for Research and Office Uses. The CEQA Reduced Density Alternative would include approximately 1.1 million square feet for Research and Office Uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 130,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging.
- **NEPA No-Action Alternative**, under which the proposed action would not be constructed and operated at the Project Site. The buildings within the Limits of Work that are currently operational would continue to be operational. The buildings within the Limits of Work that are currently vacant would be reoccupied consistent with the prior uses of the buildings (e.g., ancillary buildings that supported Navy operations as well as industrial, storage, and utility facilities); reoccupying the vacant buildings would not require construction activity. The NASA Ames Development Plan (NADP), which established NASA's vision for long-term development of NASA ARC, also allows other types of uses at the Project Site. The NEPA No-Action Alternative could result in retaining the approximately 185,600 square feet of existing mixed uses, resulting in approximately 668 employees.[8] The NEPA No-Action Alternative would not result in the reoccupation of any buildings formerly used for lodging; thus, the NEPA No-Action Alternative would not generate any new full-time residents or short term occupants (e.g., summer interns) within the Limits of Work.

ES.3.1 Project Variant

The Project Proponent has identified one variant/sub-alternative that includes certain project features that are different: the No Student/Faculty Housing Variant/Sub-Alternative (Variant).[9] Both the CEQA Proposed Project and the CEQA Reduced Density Alternative include the Variant. The Variant would replace the 130,000 square feet of Student/Faculty Housing in Subarea 6 with 130,000 square feet of Research and Office Uses under both the CEQA Proposed Project and CEQA Reduced Density Alternative. Specifically, the Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses. The Variant would have the same type of land uses; the same general site plan; the same maximum building height; the same amount of Conference Uses, Active Uses, Short-Term Lodging, and open space; the same number of guests; the same roadway infrastructure; the same utility infrastructure; the same parking ratio; and the same construction activities proposed and evaluated under the CEQA Proposed Project and CEQA Reduced Density Alternative, unless otherwise noted below. Because the amount of Research and Office Uses and the number of Student/Faculty Housing units

[7] Under the Water Reuse Facility Option, portions of the non-potable supply would be provided on-site rather than by Mountain View. The Central Utility Plant Option would provide a centralized heating and cooling system for all buildings instead of building-by-building heating, ventilation, and air-conditioning (HVAC) systems.

[8] This is based on a generation rate of 3.6 employees per 1,000 square feet.

[9] Throughout this joint EIR/EIS, *Variant* refers to both the variant (under CEQA) and the Sub-Alternative (under NEPA).

would be different under the Variant, the number of bicycle parking spaces, and the number of residents, employees, and students would likewise change. The differences among the CEQA Proposed Project, the CEQA Proposed Project with the Variant, the CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant are analyzed quantitatively throughout this joint EIR/EIS, as applicable.

ES.3.2 Additional CEQA Alternatives

Consistent with the guidance in State CEQA Guidelines Sections 15126.6(d) and 15126.6(e), the following two additional CEQA alternatives are evaluated and compared to the CEQA Proposed Project:

- **CEQA No-Project/Existing Conditions Alternative**, under which the Project Proponent would not construct and operate the CEQA Proposed Project at the Project Site. The buildings within the Limits of Work that are currently operational would continue to be operational, and the buildings within the Limits of Work that are currently vacant would remain vacant.[10]
- **CEQA Reduced Height Alternative,** which would create approximately 2 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. Compared to the CEQA Proposed Project, the CEQA Reduced Height Alternative would achieve lower maximum building height in some areas. In addition, the CEQA Reduced Height Alternative would provide less space for Research and Office Uses and less space for Student/Faculty Housing compared to the CEQA Proposed Project. The CEQA Reduced Height Alternative would include approximately 1.66 million square feet for Research and Office uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 100,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging.

The CEQA Proposed Project, the CEQA Proposed Project with the Variant, the CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant are discussed throughout this joint EIR/EIS, whereas the two additional CEQA alternatives are discussed in Chapter 5, *Other CEQA Information and Alternatives*.

ES.4 CEQA Project Objectives

Section 15124(b) of the CEQA Guidelines requires a project to contain a clear statement of project objectives, including the underlying purpose of the project. The underlying purpose of the proposed project is to redevelop the approximately 39-acre Project Site with an economically viable development that combines housing, lodging, conference center, and academic uses, and employment opportunities near transit and freeway access. Project objectives include the following:

1. Develop a state-of-the-art, collaborative, and multidisciplinary master-planned research park that integrates public and private R&D efforts in the areas of space exploration, scientific discovery, and aeronautics, as contemplated in the NASA Ames Development Plan (NADP).
2. Co-locate University of California, Berkeley (UC Berkeley) academic and private industry research space at NASA Ames Research Center (NASA ARC) to enable intellectual exchange,

[10] This provides a conservative analysis under CEQA for the purposes of comparison.

interdisciplinary research and experimentation, and further advancements in science, engineering, and technology among government, private industry, and academia.

3. Provide sufficient multi-tenant Class A office, R&D, academic space, and a conference center to support a variety of research functions and tenant types and sizes to create a synergistic campus environment while maintaining flexibility to be responsive to academic needs, tenant demands, and market conditions.
4. Provide a publicly accessible and high-quality central greenspace to provide a space for collaboration and informal meeting spaces for faculty, staff, employees, and visitors of the Berkeley Space Center while also providing ecological functions such as stormwater management and phytoremediation.
5. Redevelop an underutilized site by replacing existing obsolete and aging buildings and infrastructure with new state-of-the-art buildings and infrastructure in a manner that optimizes density and site capacity while complying with applicable environmental and land use restrictions.
6. Create a financially sustainable R&D campus that can support costs associated with the completion of the critical infrastructure upgrades and improvements necessary to redevelop the site and facility operations.
7. Provide a positive fiscal impact on the local economy and NASA ARC through the creation of public, private, and non-profit industry jobs

ES.5 NEPA Purpose and Need

In accordance with NEPA requirements, the purpose of the proposed project is to:

- Facilitate the development and long-term operation of a collaborative research environment at NASA ARC as contemplated in the NADP.
- Create a research development that combines UC Berkeley's mission to accelerate scientific discovery, create innovative technologies, and advance knowledge for the benefit of humanity with NASA's mission to enable exploration, innovative technologies, and interdisciplinary scientific discovery through the integration of public and private research and development efforts.
- Strengthen and expand NASA ARC's global profile, attracting and retaining new research talent as well as generating innovative ideas for use throughout the world and the cosmos.
- Promote collaborative research and development activities among NASA ARC, UC Berkeley, private industry, and non-profit organizations.
- Provide lodging options or on-site short-term housing, or both, to primarily support faculty, students, and visitors.
- Enable more efficient use of land at NASA ARC by demolishing older underutilized buildings and infrastructure and constructing new facilities and associated infrastructure involved in the creation of the new research space.

The need for the proposed project is as follows:

- To maintain NASA's position at the forefront of technological innovation and as a catalyst for space and aeronautical research and technology transfer.
- To strengthen the United States' ability to address the research challenges of tomorrow by combining NASA's unique ability to focus on high-risk long-term research; the industry's ability to react quickly with applied technology; and the UC Berkeley's expertise in educating and providing a vibrant workforce for the future.

ES.6 Summary of Environmental Impacts

Table ES-1 describes impact topics considered in the EIR, identifies the level of significance without mitigation, provides recommended mitigation measures, and the level of significance with mitigation for the CEQA Proposed Project, CEQA Proposed Project with Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with Variant. For a complete description of potential impacts and recommended mitigation measures for the proposed project, please refer to the specific topic of discussion in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*. As shown in Table ES-1, all mitigation measures required to reduce impacts for the CEQA Proposed Project are also required for the CEQA Reduced Density Alternative, and the Variant.

Table ES-1 also describes impact topics considered in the EIS, identifies the level of significance without mitigation, provides recommended mitigation measures, and the level of significance with mitigation for NEPA Build Alternative 1, NEPA Build Alternative 1 Sub-Alternative, NEPA Build Alternative 2, and NEPA Build Alternative 2 Sub-Alternative. For a complete description of potential impacts and recommended mitigation measures, please refer to the specific topic of discussion in Chapter 4, *Environmental Impact Statement*. As shown in Table ES-1, all mitigation measures required to reduce impacts for NEPA Build Alternative 1 are also required for NEPA Build Alternative 2, and the Sub-Alternative.

Levels of significance in Table ES-1 are categorized as follows:

NI	No Impact
LTS	Less than Significant
PS	Potentially Significant
LTSM	Less than Significant with Mitigation
SUM	Significant and Unavoidable with Mitigation
SU	Significant and Unavoidable

ES.7 Significant Impacts

As discussed in more detail throughout the resource-specific sections in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS, and as summarized in Table ES-1, impacts in the following areas would be significant and unavoidable with implementation of mitigation measures for the

CEQA Proposed Project (NEPA Build Alternative 1), CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with Sub-Alternative), CEQA Reduced Density Alternative (NEPA Build Alternative 2), and CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with Sub-Alternative).

CEQA

- **Impact CEQA-AIR-1. Conflicts with Air Quality Plan**. The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would result in ROG and PM_{10} emissions (see Impact CEQA-AIR-2) and cancer risks as well as $PM_{2.5}$ concentrations above the Air District's thresholds (see Impact CEQA-AIR-3). The analysis therefore finds that the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) could impede the protection of regional air quality and the elimination of health disparities under State standards as well as obstruct implementation of the 2017 Clean Air Plan under CEQA. Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1 would be required to reduce project-generated emissions during construction and operation and associated health risks from receptor exposure to TACs and $PM_{2.5}$. Although these measures would reduce emissions, operational ROG and PM_{10} would still exceed the Air District's thresholds; $PM_{2.5}$ risk would likewise exceed the Air District's thresholds at some future onsite worker receptor locations. The analysis finds that the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) could impede the protection of regional air quality and the elimination of health disparities under State standards as well as obstruct implementation of the 2017 Clean Air Plan, even with implementation of identified mitigation measures. The impact would be significant and unavoidable.
- **Impact CEQA-AIR-2. Criteria Pollutants (Full Operations).** Although sustainable project design features would reduce the severity of growth-oriented criteria pollutants by supporting energy-efficient buildings and fostering active and alternative transportation, the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant), would generate ROG and PM_{10} emissions above the Air District's thresholds. ROG emissions would be primarily the result of consumer products, architectural coatings, and landscaping equipment (i.e., area sources). PM_{10} emissions would be primarily the result of private vehicle trips. Mitigation Measures AQ-5 and AQ-6 would be required to reduce ROG emissions from area sources. Mitigation Measure AQ-5 requires, at a minimum, the use of low-VOC paints and cleaning supplies. Mitigation Measure AQ-6 would require the use of zero-emission landscaping equipment over conventional gasoline-fueled counterparts. Mitigation Measure AQ-6 would also reduce operational NO_X, PM_{10}, and $PM_{2.5}$ emissions, and Mitigation Measure TRAN-1 requires implementation of a mitigated TDM plan that further reduces vehicle miles traveled (VMT). Nonetheless, even with implementation of the above-identified mitigation measures, ROG and PM_{10} emissions would still exceed the Air District's thresholds. The project design features and Mitigation Measures AQ-5, AQ-6 and TRAN-1 collectively represent the best available control strategies to reduce operational emissions resulting from buildout of a large-scale development project. There is no feasible mitigation beyond these measures and the project design features to reduce operational ROG and PM_{10} emissions to levels below the Air District's thresholds. Consequently, the impact on air quality from ROG and PM_{10} emissions during operation of the CEQA Proposed Project (with and without the Variant) and the CEQA

Reduced Density Alternative (with and without the Variant) would be significant and unavoidable.

- **Impact CEQA-AIR-3. Pollutant Concentrations.** The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would result in exceedances of the Air District project-level cancer risk threshold and $PM_{2.5}$ threshold for existing off-site receptors located adjacent to the Project Site. For future on-site worker receptors, there would be exceedances of the project-level cancer risk threshold and $PM_{2.5}$ threshold due to project construction activities. The primary cause of the cancer risk threshold exceedances for existing and future receptors is exposure to DPM during construction at the Project Site—specifically, exhaust from off-road equipment and on-site trucks, with smaller contributions from operational sources of TACs. The primary causes of the $PM_{2.5}$ concentration exceedances are on-site off-road equipment activity, earthmoving activity, and vehicle travel, which generates fugitive $PM_{2.5}$ from resuspended road dust. Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, and GHG-1 would be required to minimize construction cancer and $PM_{2.5}$ risks. Mitigation Measure TRAN-1 would be required to reduce operational $PM_{2.5}$ risks. However, the CEQA Proposed Project (with and without the Variant) would exceed the Air District's annual $PM_{2.5}$ thresholds, even with implementation of the above-identified mitigation measures. These measures collectively represent the best available control strategies to reduce receptor exposure to emissions resulting from buildout of a large-scale development project. There is no further mitigation available, and this impact would be significant and unavoidable.
- **Impact CEQA-C-AIR-1. Cumulative Air Quality Impacts.** Because impacts from criteria pollutants are cumulative in nature, the project-level and cumulative impact thresholds for the analysis of regional air quality impacts are the same. Thus, the analysis and conclusions presented characterize the cumulative regional air quality impacts of the project. Emissions generated by the project during the construction period would not contribute to a cumulative regional air quality impact under CEQA with mitigation. However, long-term operational emissions of ROG and PM_{10} would be cumulatively considerable, even with implementation of all feasible mitigation. Localized $PM_{2.5}$ concentrations at the maximally exposed receptor location would also be cumulatively considerable. This impact is significant and unavoidable.
- **Impact CEQA-CUL-1. Historical Resources.** The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would result in physical damage to contributors to the NAS Sunnyvale Historic District associated with construction equipment and vibration within the Limits of Work, and new development would introduce new facilities into the setting of the NAS Sunnyvale Historic District that would significantly alter the visual character of the district's immediate surroundings. Implementation of Mitigation Measure CUL-1 would ensure that contributing streetlights would be protected from inadvertent damage during construction. Mitigation Measure NOI-5 would protect historical resources near vibration-producing construction activities. Mitigation Measure CUL-2 would establish a process through which the design of project components adjacent to the historic district would be developed to be as architecturally compatible with the NAS Sunnyvale Historic District as feasible while also meeting project objectives. However, it cannot be guaranteed that Mitigation Measure CUL-2 would successfully prevent material impairment to the NAS Sunnyvale Historic District's setting. If it is not feasible to modify project designs in a manner that complies with the Secretary of the Interior's Standards, Mitigation Measure CUL-3 would require the development of interpretive materials that document the historic district's physical development and setting. However, there is no feasible mitigation beyond these

measures and the project design features to prevent material impairment of the historic district's setting. Even with the project design features and mitigation measures, the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would result in substantial adverse change to the setting of the NAS Sunnyvale Historic District; that change would constitute material impairment of the historic district's significance. Therefore, there would be a significant and unavoidable impact on built-environment resources.

- **Impact CEQA-CUL-2: Archaeological Resources.** The Are of Potential Effects (APE) and Area of Direct Impacts (ADI) have a history of precontact and historic-period use and physical remnants from these former uses still exist within the APE and ADI. Therefore, the CEQA Proposed Project's grading and excavation may substantially disturb, damage, or degrade archaeological resources. As a result, construction may cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5. Ground disturbance within the Project Site extending up to five feet in depth could result in partial or complete destruction of two assumed eligible archaeological sites identified within the Project Site (CA-SCL-1145 and CA-SCL-1146). Mitigation Measures CUL-4, CUL-5, and CUL-6 would require preparation and implementation of a Cultural Resources Treatment and Monitoring Plan (CRTMP), cultual resources monitoring and sensitivity training, and protocols for inadvertent discoveries of cultural resources, which would reduce the impacts to archaeological resources. Even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact CEQA-CUL-3: Human Remains.** The CEQA Proposed Project would have a significant impact if it were to disturb human remains, including those interred outside of dedicated cemeteries. The results of the records search from the Northwest Information Center indicated that human remains have been recorded within the APE and ADI and within a 0.5-mile radius. Moreover, it is possible that original construction of the former and existing uses at the Project Site has displaced human remains or other types of cultural resources. Project grading and excavation may encounter and disturb human remains. Mitigation Measure CUL-7 includes protocols for the discovery of previously unknown human remains in the event that they are encountered during construction. Implementation of Mitigation Measure CUL-7 would reduce impacts to human remains. As discussed above, there are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on human remains would remain significant and unavoidable with the implementation of mitigation.
- **Impact CEQA-C-CUL-1. Cumulative Historical Resources Impacts.** The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) in combination with cumulative projects would result in substantial adverse change to the setting of the expanded NAS Sunnyvale Historic District. For example, the demolition of Hangar Three removed a historic district contributor and diminished the district's historic visual character. The removal of other historic district contributors by cumulative projects and construction of new facilities in the NASA Research Park (NRP) consistent with the buildout of the NASA Ames Development Plan (NADP) may further diminish significant qualities in the historic district's setting. The cumulative impact on historical resources would therefore be significant, and the proposed project's contribution to this impact would be cumulatively

considerable. Implementation of Mitigation Measure CUL-2 would improve the proposed project's architectural compatibility with the contributors to the NAS Sunnyvale Historic District. Mitigation Measure CUL-2 would be expected to somewhat reduce the proposed project's visual impact on the historic district's setting but would not reduce the setting impact to a less-than-significant level. Mitigation Measure CUL-3 has been identified to document and share information on the historical development and setting of the NAS Sunnyvale Historic District but would not be able to avoid the change in the district's setting. Therefore, even with implementation of all feasible mitigation measures, the contribution of the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) to cumulative impacts on built-environment historical resources would be cumulatively considerable with mitigation.

- **Impact CEQA-CUL-2: Cumulative Archaeological Resources and Human Remains Impacts.** The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) in combination with cumulative projects, would include construction excavations with the potential to affect archaeological resources and human remains. The proposed project and all cumulative projects would be required to implement best management practices, policy/regulatory requirements, and/or mitigation measures to ensure that project activities would not result in the inadvertent destruction of archaeological resources. Nonetheless, cumulative impacts on archaeological resources and disturbance of human remains are considered significant because the cumulative projects would most likely involve ground-disturbing activities that could uncover unknown archaeological resources. Because damage to archaeological resources is irreversible, past projects, the effects of other current projects, and the effects of probable future projects would have a significant unavoidable impact on known and potentially unknown archaeological resources. Therefore, even with the implementation of mitigation, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to significant environmental impacts on archaeological resources and human remains. Therefore, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to significant environmental impacts on archaeological resources and human remains.

- **Impact CEQA-GHG-1: Greenhouse Gas Emissions.** The CEQA Reduced Density Alternative (with and without the Variant) would be expected to exceed vehicle miles traveled (VMT) per service population threshold, which conflicts with the Air District's VMT criteria for transportation. Mitigation Measure TRAN-1 requires implementation of a mitigated TDM plan that further reduces VMT; it would not achieve sufficient reductions to meet the regional per service population VMT target. Accordingly, operation of the CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to global climate change from mobile sources. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.

- **Impact CEQA-GHG-2**: **Conflict with Applicable Plan, Policy, or Regulation Adopted to Reduce Greenhouse Gas Emissions.** The regional VMT reduction target is designed to meet regional and statewide VMT and emission reduction goals. Because consistency with the regional VMT threshold cannot be achieved with implementation of Mitigation Measure TRAN-1 (see Impact CEQA-GHG-1), the CEQA Reduced Density Alternative (with and without the Variant)

would conflict with *Plan Bay Area* and *2017 Clean Air Plan*. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.

- **Impact CEQA-C-GHG-1: Cumulative Greenhouse Gas Emissions Impacts.** Climate change is a global problem, and GHG impacts are inherently cumulative. Thus, project-level conclusions characterize the cumulative impacts. Because consistency with the regional VMT threshold cannot be achieved with implementation of Mitigation Measure TRAN-1 (see Impact CEQA-GHG-1), the CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to global climate change from mobile sources and conflict with *Plan Bay Area* and *2017 Clean Air Plan*. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact CEQA-NOI-1a. Construction Noise.** Daytime construction noise levels from both on- and off-site (in-street) construction would be expected to exceed County construction noise thresholds at the nearest noise-sensitive uses. A 10 dB increase (or greater) over the existing ambient noise level would also be expected to occur at the nearest noise-sensitive uses. Because noise levels from daytime construction may exceed the applicable construction noise thresholds and result in a 10 dB or greater increase in the ambient noise level, daytime construction noise impacts would be considered potentially significant. In addition, concrete pours and off-site/in-street construction activities taking place during nighttime hours may result in noise levels that would exceed the applicable construction noise thresholds and a 10 dB or greater increase in the ambient nighttime noise level. Nighttime construction noise impacts would also be considered potentially significant. Mitigation Measure NOI-1, which requires a noise control plan that includes measures to reduce noise from construction during all hours (i.e., daytime and nighttime hours), would be implemented to reduce the project's significant impacts related to daytime and nighttime construction noise. Although this mitigation measure would reduce construction noise levels, it may not be possible to reduce noise levels during all construction activities to less-than-significant levels. Mitigation Measure NOI-2 would also be implemented, which includes the installation of temporary construction noise barriers along the western and southern perimeters of all project subareas within 1,400 feet of Wescoat Village. However, in order for temporary noise barriers to be effective, they must block the full line of sight between the noise source and the receiver, which may not be feasible at all locations during all construction activities. In addition, note that Mitigation Measure NOI-2 would not be expected to reduce noise from nighttime off-site/in-street work because such work would generally not take place behind the temporary noise barriers described under this measure. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact CEQA-NOI-2. Excessive Groundborne Vibration or Groundborne Noise Levels (Vibration-Sensitive Laboratory Equipment).** An analysis was conducted to determine if construction-related vibration from the project could be disruptive for sensitive research equipment at nearby off-site laboratories, such as USGS Building 800, which is north of the Project Site. Vibration-sensitive machinery or instruments, such as those used in research laboratories or hospitals, can be affected by much lower vibration velocity levels than other uses. According to the analysis, vibration generated by project construction equipment may exceed thresholds for the various sensitive equipment categories at distances of approximately 9 to 1,350 feet (depending on both the type of construction equipment in use and the specific sensitivity of nearby laboratory equipment). It is important to note that the nearby USGS Building 800 includes some vibration-isolation features in select rooms, which may reduce the

propagation of external vibration to sensitive equipment within those rooms. In addition, background vibration velocity levels in typical residential and educational environments are generally around 50 VdB, as noted in FTA's *Transit Noise and Vibration Impact Assessment Manual*. Consequently, ambient vibration levels at laboratory facilities near the Project Site, including USGS Building 800, may already exceed the VC-D and VC-E criteria established for highly sensitive equipment. However, vibration from project construction may still interfere with the use of some sensitive research equipment within nearby laboratory buildings. Mitigation Measure NOI-6 has been identified to reduce impacts on vibration-sensitive equipment. However, even with implementation of all feasible mitigation, it may not be possible to eliminate vibration-related interference effects on nearby sensitive laboratory or research equipment. Construction vibration impacts on nearby sensitive research equipment would be considered significant and unavoidable with mitigation.

- **Impact CEQA-C-NOI-1a: Cumulative Construction Noise.** As described previously, worst-case daytime construction noise levels from the project may exceed the applicable County criterion for daytime construction noise (65 dBA L_{eq}) from construction activities lasting 10 days or longer. A 10 dB increase (or greater) over the existing ambient noise level would also be expected to occur at the nearest noise-sensitive receptors. Similarly, nighttime construction noise levels may exceed the applicable criterion of 55 dBA for multi-family residential land uses. A 10 dB increase (or greater) over the existing ambient noise level would be expected to occur at the nearest noise-sensitive receptors. Construction of the cumulative projects is already complete; consequently, cumulative project construction would not be expected to occur concurently with project construction activities (beginning in 2027). Construction noise from cumulative projects would therefore not be expected to combine with construction noise from the proposed project and expose nearby sensitive receptors to greater overall construction noise levels. However, because project construction noise levels for both daytime and nighttime hours were modeled to exceed applicable thresholds, cumulative construction noise impacts would conservatively be considered significant. Although mitigation measures would be expected to somewhat reduce project construction noise, it may not be possible to reduce all construction noise levels to a level below the significance thresholds used in this assessment, even with implementation of all feasible mitigation measures. Therefore, cumulative construction noise effects during daytime and nighttime hours are considered to be significant and unavoidable, and the project's contribution would be considered cumulatively considerable, even with the implementation of project-specific mitigation.
- **Impact CEQA-C-NOI-1a: Cumulative Excessive Groundborne Vibration or Groundborne Noise Levels (Vibration-Sensitive Laboratory Equipment).** Vibration generated by project construction equipment may exceed thresholds for the various sensitive equipment located within the nearby USGS Building 800 according to the project-specific vibration analysis. Note that the cumulative projects list does not include any projects in proximity to the nearby USGS Building 800 (with construction of all nearby cumulative projects already complete) for which construction would occur concurrently with project construction. Therefore, vibration from project construction would not be expected to combine with vibration from the construction of cumulative projects and result in greater levels of interference with nearby vibration-sensitive research equipment. However, because project-specific impacts related to interference with vibration-sensitive research equipment were considered significant, cumulative impacts related to interference with vibration-sensitive research equipment would also conservatively be considered significant. Mitigation Measure NOI-6 has been identified to reduce impacts on

vibration-sensitive equipment. Even with implementation of all feasible mitigation, it may not be possible to fully reduce vibration-related annoyance effects on nearby sensitive laboratory or research equipment. Cumulative vibration impacts related to interference with vibration-sensitive equipment would conservatively be considered significant and unavoidable, and the project's contribution would be cumulatively considerable, even with implementation of mitigation.

- **Impact CEQA-TRAN-2: Vehicle Miles Traveled.** The CEQA Reduced Density Alternative (with and without the Variant) would be expected to exceed VMT per service population threshold, which is based on the total VMT per service population for the Bay Area region under 2024 (existing) conditions. Mitigation Measure TRAN-1 would be required to reduce VMT through implementation of a mitigated TDM plan to reduce project-generated trip generation and associated VMT. The mitigated TDM plan includes both project-specific TDM elements and mitigated TDM elements and specifies which TDM measures need to be completed before construction completion, before Phase 1 certificate of occupancy, and ongoing during implementation of the proposed project. The mitigated TDM plan outlines regular monitoring requirements to evaluate TDM effectiveness on a regular basis. While the mitigated TDM plan would reduce VMT, the CEQA Reduced Density Alternative (with and without the Variant) would still exceed the VMT threshold even with implementation of the above-identified mitigation measures. The mitigated TDM plan includes all feasible measures to reduce VMT for the proposed project (i.e., a mixed-use academic and research project). Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact CEQA-C-TRAN-2: Cumulative Vehicle Miles Traveled Impacts.** The project-level and cumulative impact the analysis of VMT impacts are the same. Thus, the analysis and conclusions presented for Impact CEQA-TRAN-2 characterize the cumulative VMT impacts of the CEQA Reduced Density Alternative (with and without the Variant). Even with implementation of Mitigation Measure TRAN-1 (see Impact CEQA-TRAN-2), the CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to a cumulatively significant VMT impact. Therefore, even with implementation of all feasible mitigation measures, the contribution of the CEQA Reduced Density Alternative (with and without the Variant) to cumulative impacts on VMT would be cumulatively considerable with mitigation. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact CEQA-TCR-1: Tribal Cultural Resources**. Through consultation with the tribes, multiple tribes identified the twelve known tribal archaeological sites in the APE as potential Tribal Cultural Resources (TCRs). The Tamien Nation also identified a cultural landscape and its multiple contributing components as potential TCRs. Under Public Resources Code (PRC) Section 21074(a)(1)(2), the CEQA lead agency has determined, in its discretion and supported by substantial evidence, the archaeological resources located within the APE/ADI are significant for the purpose of CEQA. In addition, the CEQA lead agency has determined that the cultural landscape, and its contributing components identified by the Tamien Nation that are located within the APE/ADI are significant for the purpose of the CEQA. The entire ADI also has the potential to contain as yet unidentified TCRs. The proposed project would result in impacts on the two assumed eligible archaeological sites identified within the Project Site (CA-SCL-1145 and CA-SCL-1146) and identified as TCRs by the tribes. The proposed project would also result in impacts on the cultural landscape identified as a TCR by the Tamien Nation. The CEQA

Proposed Project has the potential to cause physical damage to TCRs which may alter characteristics that qualify them as TCRs. Mitigation Measures CUL-4, CUL-5, CUL-6, and CUL-7 would require preparation and implementation of a CRTMP, tribal cultual resources monitoring and sensitivity training, protocols for inadvertent discoveries of cultural resources, and protocols for the discovery of previously unknown human remains, which would reduce the impacts to TCRs. Even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.

- **Impact CEQA-C-TCR-1: Cumulative Tribal Cultural Resources Impacts**. The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) in combination with cumulative projects, would include construction excavations with the potential to affect TCRs. The proposed project and all cumulative projects would be required to implement best management practices, policies, regulations , and/or mitigation measures to ensure that project activities would not result in the inadvertent destruction of a TCR. Nonetheless, cumulative impacts on TCRs are considered significant because the cumulative projects would most likely involve ground-disturbing activities that could uncover unknown TCRs. Because damage to TCRs is irreversible, past projects, the effects of other current projects, and the effects of probable future projects would have a significant unavoidable impact on known and potentially unknown TCRs. Therefore, even with the implementation of mitigation, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to significant environmental impacts on TCRs. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact CEQA-UTIL-2: Water Supply**. The San Francisco Public Utilities Commission (SFPUC) would have adequate water supplies available to enable NASA to provide water to the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) and reasonably foreseeable future development during normal years. However, current SFPUC potable demand would exceed available supply in single dry through multiple dry year scenarios, with the supply shortfall relative to demand ranging from 27 to 37 percent. SFPUC's Water Shortage Contingency Plan (WSCP) identifies water demand reduction measures for drought scenarios. Therefore, SFPUC is expected to enact its WSCP to curtail demand and ensure that its supplies would remain adequate and able to serve all users, including the proposed project. Because the proposed project is not subject to the reduction measures of the WSCP, project-specific mitigation, in the form of Mitigation Measure UTIL-1, would be necessary to support the water supplier's reduction intent. Implementation of Mitigation Measure UTIL-1 would require the Project Proponent and NASA ARC to implement parallel water demand reduction measures during single-dry and multiple-dry years to achieve reduction levels consistent with those in the WSCP. This mitigation measure would reduce effects related to water supply in drought conditions. However, even with implementation of project Mitigation Measure UTIL-1, the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) could experience a water supply shortfall relative to demand in dry year conditions. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact CEQA-C-UTIL-1: Cumulative Water Supply Impacts**. The impacts on water supply and infrastructure under the CEQA Proposed Project (with and without the Variant) and the CEQA

Reduced Density Alternative (with and without the Variant), described in Impact CEQA-UTIL-1 is cumulative in nature because the analysis evaluates whether SFPUC has adequate water supplies available to serve the proposed project and reasonably foreseeable future development during normal, dry, and multiple dry years. As discussed in Impact CEQA-UTIL-2, SFPUC can meet customer demand through 2045 during normal years; however, during single-year and multi-year droughts, SFPUC will need to implement the WSCP to meet supply shortfalls. Therefore, even with implementation of all feasible mitigation measures, the contribution of the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) to cumulative impacts on water supply could be cumulatively considerable with mitigation. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.

NEPA

- **Impact NEPA-AIR-1. Conflicts with Air Quality Plan**. The NEPA Build Alternative 1 (with and without the Sub-Alternative) and the NEPA Build Alternative 2 (with and without the Sub-Alternative) would result in ROG and PM_{10} emissions (see Impact CEQA-AIR-2) and cancer risks as well as $PM_{2.5}$ concentrations above the Air District's thresholds (see Impact CEQA-AIR-3). The analysis therefore finds that the NEPA Build Alternative 1 (with and without the Sub-Alternative) and the NEPA Build Alternative 2 (with and without the Sub-Alternative) could impede the protection of regional air quality and the elimination of health disparities under State standards as well as obstruct implementation of the 2017 Clean Air Plan under CEQA. Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1 would be required to reduce project-generated emissions during construction and operation and associated health risks from receptor exposure to TACs and $PM_{2.5}$. Although these measures would reduce emissions, operational ROG and PM_{10} would still exceed the Air District's thresholds; $PM_{2.5}$ risk would likewise exceed the Air District's thresholds at some future onsite worker receptor locations. The analysis finds that the NEPA Build Alternative 1 (with and without the Sub-Alternative) and the NEPA Build Alternative 2 (with and without the Sub-Alternative) could impede the protection of regional air quality and the elimination of health disparities under State standards as well as obstruct implementation of the 2017 Clean Air Plan, even with implementation of identified mitigation measures. The impact would be significant and unavoidable.
- **Impact NEPA-AIR-3. Pollutant Concentrations.** The NEPA Build Alternative 1 (with and without the Sub-Alternative) and the NEPA Build Alternative 2 (with and without the Sub-Alternative) would result in exceedances of the Air District project-level cancer risk threshold and $PM_{2.5}$ threshold for existing off-site receptors located adjacent to the Project Site. For future on-site worker receptors, there would be exceedances of the project-level cancer risk threshold and $PM_{2.5}$ threshold due to project construction activities. The primary cause of the cancer risk threshold exceedances for existing and future receptors is exposure to DPM during construction at the Project Site—specifically, exhaust from off-road equipment and on-site trucks, with smaller contributions from operational sources of TACs. The primary causes of the $PM_{2.5}$ concentration exceedances are on-site off-road equipment activity, earthmoving activity, and vehicle travel, which generates fugitive $PM_{2.5}$ from resuspended road dust. Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, and GHG-1 would be required to minimize construction cancer and $PM_{2.5}$ risks. Mitigation Measure TRAN-1 would be required to reduce operational $PM_{2.5}$ risks. However, the NEPA Build Alternative 1 (with and without the Sub-Alternative) would exceed the Air District's annual $PM_{2.5}$ thresholds, even with implementation of the above-

identified mitigation measures. These measures collectively represent the best available control strategies to reduce receptor exposure to emissions resulting from buildout of a large-scale development project. There is no further mitigation available, and this impact would be significant and unavoidable.

- **Impact NEPA-AIR-5. Regional and Local Air Quality.** As discussed in Impact CEQA-AIR-1 in Section 3.3, *Air Quality*, NEPA Build Alternative 1 (with and without the Sub-Alternative) and NEPA Build Alternative 2 (with and without the Sub-Alternative) are not expected to contribute to any new localized CO hot-spots. Likewise, neither construction nor operation of NEPA Build Alternative 1 or NEPA Build Alternative 2 would result in new or worsened odors that would affect a substantial number of people. Background TAC sources in combination with the proposed project would exceed the Air District's $PM_{2.5}$ risk threshold at the maximally affected receptor location, which could result in a significant impact and conflict with the community health goals of the 2017 Clean Air Plan. Mitigation Measures AQ-1, AQ-2, and GHG-1 (which would reduce use of diesel in construction equipment); AQ-3 AQ-8, and HAZ-1 (which would require dust control); AQ-9 (which provides worker training to reduce exposure to emissions), and TRAN-1 (which would reduce operational trips) would reduce impacts. The maximum $PM_{2.5}$ risk is concluded to remain above the Air District's threshold even after mitigation. .
- **Impact NEPA-NOI-1a. Construction Noise.** Daytime construction noise levels from both on- and off-site (in-street) construction would be expected to exceed County construction noise thresholds at the nearest noise-sensitive uses. A 10 dB increase (or greater) over the existing ambient noise level would also be expected to occur at the nearest noise-sensitive uses. Because noise levels from daytime construction may exceed the applicable construction noise thresholds and result in a 10 dB or greater increase in the ambient noise level, daytime construction noise impacts would be considered potentially significant. In addition, concrete pours and off-site/in-street construction activities taking place during nighttime hours may result in noise levels that would exceed the applicable construction noise thresholds and a 10 dB or greater increase in the ambient nighttime noise level. Nighttime construction noise impacts would also be considered potentially significant. Mitigation Measure NOI-1, which requires a noise control plan that includes measures to reduce noise from construction during all hours (i.e., daytime and nighttime hours), would be implemented to reduce the project's significant impacts related to daytime and nighttime construction noise. Although this mitigation measure would reduce construction noise levels, it may not be possible to reduce noise levels during all construction activities to less-than-significant levels. Mitigation Measure NOI-2 would also be implemented, which includes the installation of temporary construction noise barriers along the western and southern perimeters of all project subareas within 1,400 feet of Wescoat Village. However, in order for temporary noise barriers to be effective, they must block the full line of sight between the noise source and the receiver, which may not be feasible at all locations during all construction activities. In addition, note that Mitigation Measure NOI-2 would not be expected to reduce noise from nighttime off-site/in-street work because such work would generally not take place behind the temporary noise barriers described under this measure. Therefore, even with implementation of all feasible mitigation measures, this impact would be significant and unavoidable.
- **Impact NEPA-NOI-2. Excessive Groundborne Vibration or Groundborne Noise Levels (Vibration-Sensitive Laboratory Equipment).** An analysis was conducted to determine if construction-related vibration from the project could be disruptive for sensitive research equipment at nearby off-site laboratories, such as USGS Building 800, which is north of the

Project Site. Vibration-sensitive machinery or instruments, such as those used in research laboratories or hospitals, can be affected by much lower vibration velocity levels than other uses. According to the analysis, vibration generated by project construction equipment may exceed thresholds for the various sensitive equipment categories at distances of approximately 9 to 1,350 feet (depending on both the type of construction equipment in use and the specific sensitivity of nearby laboratory equipment). It is important to note that the nearby USGS Building 800 includes some vibration-isolation features in select rooms, which may reduce the propagation of external vibration to sensitive equipment within those rooms. In addition, background vibration velocity levels in typical residential and educational environments are generally around 50 VdB, as noted in FTA's *Transit Noise and Vibration Impact Assessment Manual*.[11] Consequently, ambient vibration levels at laboratory facilities near the Project Site, including USGS Building 800, may already exceed the VC-D and VC-E criteria established for highly sensitive equipment. However, vibration from project construction may still interfere with the use of some sensitive research equipment within nearby laboratory buildings. Mitigation Measure NOI-6 has been identified to reduce impacts on vibration-sensitive equipment. However, even with implementation of all feasible mitigation, it may not be possible to eliminate vibration-related interference effects on nearby sensitive laboratory or research equipment. Construction vibration impacts on nearby sensitive research equipment would be considered significant and unavoidable with mitigation.

- **Impact NEPA-SOCIO-2. Worker Housing.** Operations under NEPA Build Alternative 1 (with and without the Sub-Alternative) would generate new employees and students at NASA ARC. Operation of NEPA Build Alternative 1 (with and without the Sub-Alternative) would exceed the impact threshold of 1 percent. Although NEPA Build Alternative 1 (with and without the Sub-Alternative) would generate workers who would not be housed on-site and would represent more than 1 percent of the predicted new households in the housing impact area (HIA) through 2040 there are some nuances to consider, including the existing housing vacancies in the HIA, the remaining underutilized sites at NASA ARC, and the nature of the housing imbalance in the region. Nonetheless, with development projects moving forward at different times, there will inevitably be temporary periods of jobs/housing imbalance. The proposed project is facilitating the overall vision of the 2002 NADP, a planning-level document, by developing an underutilized site with land uses consistent with the NRP site. As further noted in the Socioeconomics Technical Report in Section 3.3, *Labor Supply and Employment,* the housing imbalance is at a regional level and varies by jurisdiction, and based on current rates is improved from the 2002 PEIS identified rates of 1.4 to 1.6.[12] While this is a planning-level threshold and NASA could achieve an improved balance for NASA ARC through subsequent projects, given that there are no feasible mitigation measures for the Project Proponent to provide additional housing at the Project Site, the impact related to a jobs/housing imbalance would be significant and unavoidable.
- **Impact NEPA-TRAN-3. Level of Service.** Operation of NEPA Build Alternative 1 (with and without the Sub-Alternative) and NEPA Build Alternative 2 (with and without the Sub-Alternative) would generate daily, AM peak hour, and PM peak hour net new trips. Specifically, operations at the Ellis Street/Manila Avenue Intersection in the City of Mountain View would

[11] Ibid.

[12] As detailed in Appendix 4-1, Section 3.3, for every housing unit in Mountain View, Sunnyvale, and Santa Clara County, there are 1.21, 1.37, and 1.41 employed persons, respectively. These rates are comparable and in some cases better than the current Bay Area-wide rate of 1.4.

exceed the threshold of significance and degrade the intersection from acceptable LOS C to unacceptable LOS F during both the AM and PM peak hours under Reasonably Foreseeable conditions. Mitigation Measure TRAN-1 would reduce the proposed project-generated traffic at the intersection through implementing additional TDM measures and Mitigation Measure TRAN-2 (NEPA-only) would reduce the delay at this intersection through installing a signal at the intersection, which would result in the intersection operating at LOS B during AM and PM peak hours. However, due to the need for coordination with the City of Mountain View under Mitigation Measure TRAN-2 (NEPA-only), the Project Proponent cannot ensure implementation of the signal, and as such, the impact at the Ellis Street / Manila Avenue intersection would be considered significant and unavoidable.

- **Impact NEPA-UTIL-2: Water Supply for Existing Users**. The Water Supply Evaluation identifies that current SFPUC plus project water demand exceeds supply in single dry through multiple dry year scenarios: with supply shortfall relative to demand ranging from 27 to 37 percent under NEPA Build Alternative 1 (with and without the Sub-Alternative) and NEPA Build Alternative 2 (with and without the Sub-Alternative). Because the WSCP systematically identifies ways in which SFPUC can reduce water demand for the six drought stages to address water demand reductions of more than 50 percent, it is anticipated that, in single and multiple dry years, SFPUC would enact its WSCP to curtail demand and ensure that its supplies would remain adequate and able to serve all users, including the proposed project. However, because the proposed project is not subject to the reduction measures of the WSCP, project specific mitigation would be necessary to support the water supplier's reduction intent. Mitigation Measure UTIL-1 would require the Project Proponent implement parallel water demand reduction measures during single-dry and multiple-dry years to achieve reduction levels consistent with those in the WSCP. While this mitigation measure would reduce effects related to water supply in drought conditions, conservatively, because the WSE and SFPUC identify a water supply shortfall relative to demand in dry year conditions, even with implementation of project Mitigation Measure UTIL-1, the overall exceedance could interfere with the ability of SFPUC to meet the foreseeable needs of existing users, and the impact is considered to be significant and unavoidable.
- **Impact NEPA-UTIL-3. Water Supply Capacity to NASA ARC.** SFPUC would experience supply shortfalls relative to total demand estimated to range from 27 to 37 percent during single to multiple dry years, and in Scenario 2 during dry and multiple dry years there would be an anticipated exceedance in water demand relative to water supply. While SFPUC is anticipated to meet demand-supply shortfalls by implementing its WSCP, the proposed project is not subject to the demand reduction measures of the WSCP. Therefore, implementation of Mitigation Measure UTIL-1 would be necessary to support the water supplier's reduction intent. Mitigation Measure UTIL-1 would require the Project Proponent implement parallel water demand reduction measures during single-dry and multiple-dry years to achieve reduction levels consistent with those in the WSCP. While this mitigation measure would reduce effects related to water supply in drought conditions, conservatively, because the WSE and SFPUC identify a water supply shortfall relative to demand in dry year conditions, even with implementation of project Mitigation Measure UTIL-1, there could still be an overall water supply shortfall for NASA ARC, and the impact is considered to be significant and unavoidable.

ES.8 Areas of Controversy

A Notice of Preparation (NOP) was released for the CEQA public scoping period from June 21, 2024, to July 22, 2024. Seven comment letters were received from public agencies and local organizations. The NEPA public scoping period in response to the Notice of Intent (NOI) was from June 25, 2024, to July 26, 2024. Four comment letters were received from public agencies, local organizations, and individuals. In addition, comments for both the NOP and NOI were received during the July 10, 2024, scoping meeting, and one comment was received during the July 15, 2024, scoping meeting.

CEQA Guidelines Section 15124 specifies that a Draft EIR summary identify "areas of controversy" known to the Lead Agency, including issues raised by agencies and the public. A summary of comments on CEQA and NEPA topics, and information and analyses received during both the CEQA and NEPA scoping periods is provided by topic below. Some topics are relevant to both NEPA and CEQA and some only to CEQA or NEPA. The topics that would result in physical impacts are addressed in the joint EIR/EIS analyses. It should be noted that during the public scoping process for both CEQA and NEPA, no other alternatives to the proposed project were suggested. Appendix 1-1, *Scoping Report*, of this joint environmental impact report/environmental impact statement (joint EIR/EIS), includes copies of all written comment received through mail, email, or the online comment forms, along with comments received during the scoping meetings.

Project Description (CEQA and NEPA)

- Clarity needed on number of proposed housing units for both Alternative 1 and 2
- Alternatives should be evaluated at equal level of detail
- Identify all measures to reduce impacts related to project construction, including recycling, salvaging, and re-use
- Clarify the County of Santa Clara's jurisdiction, if any, over the Project Site
- Explain if Santa Clara County would be a responsible agency
- California Department of Fish and Wildlife is a trustee agency and responsible agency

Air Quality (CEQA and NEPA)

- Identify health/air quality impacts from construction and demolition activities, including potential to encounter asbestos, with application of mitigation, if necessary
- Disclose National Ambient Air Quality Standards and nonattainment status of the Project Site
- Analyze project-related emissions of particulate matter, carbon dioxide, nitrogen oxides, sulfur oxides, and fugitive dust
- Incorporate mitigation for construction and operational-related emissions
- Analyze spatial distribution of sensitive receptors around the Project Site and the engagement of such receptors throughout project process
- Disclose strategy to reduce construction-related impacts on sensitive receptors
- Evaluate and mitigate, as necessary, the impact of construction workers commuting to the Project Site

Biological Resources (CEQA and NEPA)

- Project should protect biological resources and minimize degradation of wildlife habitats
- Within environmental setting include full list or table that notes species common name, scientific name, state/federal listing status, habitat type preference, and determination on presence for all special-status species with potential to occur
- Recommend baseline habitat assessments
- Use California Natural Diversity Database (CNDDB) and previous studies performed in the area
- Project Site contains special-status species and has the potential to support other special-status species, and an Incidental Take Permit (ITP) consultation may be required
- Recommendations for mitigation for nesting birds
- Recommendations for mitigation for roosting bats
- Recommendations for mitigation for Crotch's bumble bee
- Recommendations for mitigation for western burrowing owl

Cultural Resources (CEQA and NEPA), Tribal Cultural Resources (CEQA), and Section 106 of NHPA (NEPA)

- Section 106 consultation to be completed for the proposed project/proposed action
- Potential historic impacts and cumulative impacts should be evaluated within the NEPA scope
- Impacts on historic properties, as well as other cultural resources, which could include archaeological and resources of significance to tribes and indigenous people should be evaluated
- Project does not fall within traditional territory of the Confederated Villages of Lisjan Nation
- Provided contact for Tamien Nation
- Requirements for Assembly Bill 52, Senate Bill 18, tribal consultation and cultural resources assessment

Energy (CEQA)

- Project should be designed to maximize renewable energy use and minimize use of fossil fuels

Greenhouse Gas Emissions (CEQA and NEPA)/Climate Change (CEQA)

- For CEQA, the project should minimize use of fossil fuels
- For CEQA, discuss context of climate change impacts on the setting of the project
- Discuss impacts related to extreme precipitation/storm events, temperature, and sea-level rise and project design features or mitigation measures that would be incorporated to address impacts
- Identify project design features and transportation improvements to reduce GHG emissions and increase energy efficiency as well as reliance on renewable energy

- Require zero-emission alternatives to backup when feasible (or require Tier 4 Final generators)
- Require compliance with Leadership in Energy and Environmental Design (LEED) Version 4 checklist and California Green Building Standards Code (CALGreen) mandatory measures; commit to LEED platinum or equivalent third-party green building certification
- Identify and quantify sources of carbon dioxide emissions during project construction and operation
- Add low embodied carbon materials

Hazards and Hazardous Materials (CEQA and NEPA)

- Describe how construction workers, project employees/visitors/residents, and ecological systems would not be adversely affected by potential hazards from Middlefield-Ellis-Whisman (MEW) Superfund Site
- Discuss project construction and operation activities in relation to ongoing cleanup activities
- Discuss potential contamination/hazmat material that may be encountered during project construction
- Detail any cleanup activities that the project would implement during construction or operation
- Provided EPA contact for coordination regarding MEW site
- San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) maintains oversight regarding hazmat sites and should be coordinated with to identify areas where SFBRWQCB would provide oversight
- Conduct surveys for lead-based paint, mercury, asbestos-containing materials, and polychlorinated biphenyl caulk for structures or buildings to be demolished
- Recommend testing imported soil or fill for contaminants of concern
- Evaluate direct impact on construction workers as well as indirect costs associated with exposure to hazards and hazardous materials

Hydrology and Water Quality (CEQA and NEPA)

- Analyze change in stormwater volume and potential changes in contaminants and/or pollutants
- Provide calculations for impervious/pervious surfaces on the Project Site

Land Use (CEQA and NEPA)

- EIR/EIS to describe local land use jurisdictional issues
- Identify which federal, state, and/or local plans/regulations would apply to the project

Population and Housing (CEQA)/Socioeconomics (NEPA)

- Project to add significant pressure to already-imbalanced housing market and provide little housing to off-set impacts

- Project could result in displacement of jobs, forcing workers to live farther away from workplaces, and environmental impacts from longer commutes related to traffic, greenhouse gas emissions, and socioeconomics

Public Services (CEQA and NEPA)

- Clarify if project would request law enforcement services by the Santa Clara County Sherriff
- Identify any proposed public facilities and which providers would serve the Project Site

Transportation and Traffic (CEQA and NEPA)

- Provided city of Sunnyvale contacts for transportation-related questions
- Request to review the scope of the TIA and a draft of the TIA
- Request to review the draft EIR/EIS, specifically analysis related to vehicle miles traveled (VMT) and proposed mitigation
- Request level of service (LOS) be evaluated for intersections located in Sunnyvale using Santa Clara Valley Transportation Authority (VTA) TIA guidelines and incorporate full-/pro-rate share financial contributions toward any identified improvements
- Need to consider approved and pending development projects in Sunnyvale as part of baseline and cumulative traffic analyses
- Need to consider the Valley Transportation Plan, Sunnyvale's Capital Improvement Program, and/or Sunnyvale's Traffic Impact Feed Study as part of cumulative analysis
- Evaluate alternative modes of transportation in accordance with VTA Congestion Management Program guidelines
- List potential transportation demand management measures
- Evaluate construction-related impacts on local and regional corridors
- EIR/EIS should identify and incorporate traffic-reducing measures for project-generated VMT

Utilities and Service Systems (CEQA and NEPA)

- Provided city of Sunnyvale contacts for water-and sewer-related questions
- Sunnyvale water pollution control plant does not have adequate capacity to serve the project
- Conduct sanitary sewer analysis for both alternatives
- Provide clarity on proposed sewer connections
- Provide flow estimates for both alternatives to evaluate sewer impacts
- Provide clarity on proposed recycled water connections and use
- City of Sunnyvale does not provide water or stormwater to the Project Site

Other

- Project should incorporate labor standards and use a general contractor
- Individual requests to be included on list of interested parties to receive notices for environmental documents and hearings
- Disclose outreach and engagement efforts

Table ES-1. Summary of CEQA and NEPA Impacts and Mitigation Measures

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
Aesthetics and Visual Resources (CEQA)						
In accordance with Senate Bill 743 and Public Resources Code Section 21099, the EIR portion of this joint EIR/EIS does not consider aesthetics or vehicular parking in determining the significance of impacts under CEQA. Appendix 3.2-1 of this joint EIR/EIS includes a discussion of the proposed project's potential changes to the visual environment; for the purposes of CEQA, this information is provided for informational purposes.						
Aesthetics and Visual Resources (NEPA)						
Impact NEPA-AES-1: The project would not substantially degrade the visual character or quality of ARC or its surroundings, or obstruct significant public views or view corridors.	LTS	—	—	Same	Same	Same
Impact NEPA-AES-2: The project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	LTS	—	—	Same	Same	Same
Air Quality (CEQA)						
Impact CEQA-AIR-1: The project would conflict with or obstruct implementation of the applicable air quality plan.	PS	**Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction** All project contractor(s) must use electric-powered lifts (including aerial, scissor, and man), welders, air compressors, and mini-excavators. Diesel- or fossil-fuel-powered lifts, welders, air compressors, and mini-excavators during construction are prohibited. The Project Proponent shall verify that the requirement to use electric	SUM	Same	Same	Same

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		versions of these equipment types is identified in construction bids and on architectural plans. All other types of off-road equipment (i.e., non-lifts, welders, air compressors, and mini-excavators) with diesel engines greater than 25 horsepower must use EPA-certified Tier 4 Final engines. This mandate does not preclude use of engines that meet certification standards more stringent than Tier 4 Final, if commercially available at the time of construction. A copy of each unit's certified tier specification, emissions rating, and any required CARB permit or Bay Area Air District operating permit shall be made available to NASA at the time of mobilization of each piece of equipment. All other types of off-road equipment with diesel engines less than 25 horsepower (i.e., non-Tier 4) shall be required to use renewable diesel fuel that meets the most recent ASTM D975 specification for ultra-low sulfur diesel and has a carbon intensity no greater than 50 percent of diesel with the lowest carbon intensity among petroleum fuels sold in California. Each project contractor shall provide NASA with annual reports of renewable diesel purchase records and equipment fuel consumption. Pursuant to the In-Use Off-Road Diesel-Fueled Fleets Regulation (In-Use Regulation), contractors shall also be required to submit to CARB an affirmation that the fleet complied with the renewable diesel mandate in each year that annual reporting is required under the In-Use Regulation. **Mitigation Measure AQ-2. Zero-Emissions On-Road Vehicles during Construction** All project contractor(s) must achieve the following minimum zero-emission on-road vehicle performance standards, as commercially and financially available and feasible at the time of construction (i.e., within 100 miles of the Project Site and equivalent powered and capable zero-				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		emission vehicle can cost no more than 50 percent more (1.5 times) than its internal combustion counterpart). The standards must be achieved based on the total number of vehicles onsite used to construct the proposed project over the duration of each contract. The Project Proponent shall verify that the performance standards are identified in construction bids and on architectural plans. ● 25 percent zero-emission light-duty on-road vehicles (e.g., passenger cars, light-duty trucks) associated with Phases 1 and 2 (e.g., on-site vehicles, contractor vehicles). ● 50 percent zero-emission light-duty on-road vehicles (e.g., passenger cars, light-duty trucks) associated with Phases 3 and 4 (e.g., on-site vehicles, contractor vehicles). ● 25 percent zero-emission heavy-duty on-road vehicles associated with Phases 1 and 2 (e.g., for hauling, material delivery and soil import/export). ● 50 percent zero-emission heavy-duty on-road vehicles associated with Phases 3 and 4 (e.g., for hauling, material delivery and soil import/export). **Mitigation Measure AQ-3. Fugitive Dust Controls** All project contractor(s) shall be required to comply with the Air District's current basic control measures for fugitive dust. The Air District's current basic control measures are drawn from their 2023 CEQA Guidelines, Table 5-2, and are identified below. Compliance with the following control measures is required by the Spring 2026 project-specific Environmental Issues Management Plan and shall be identified in construction bids. ● All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, unpaved access roads) shall be watered two times per day.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		● All haul trucks transporting soil, sand, or other loose material off-site shall be covered. ● All visible mud or dirt trackout onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. ● All vehicle speeds on unpaved roads shall be limited to 15 miles per hour. ● All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used. ● All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 miles per hour. ● All trucks and equipment, including their tires, shall be washed off prior to leaving the site. ● Unpaved roads providing access to sites located 100 feet or further from a paved road shall be treated with a 6- to 12-inch layer of compacted layer of wood chips, mulch, or gravel. ● Publicly visible signs shall be posted with the telephone number and name of the person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's General Air Pollution Complaints number shall also be visible to ensure compliance with applicable regulations. **Mitigation Measure AQ-4. Low-VOC Coatings during Construction** All project contractor(s) must use certified (e.g., Greenguard or Green Seal) low-volatile organic compound (VOC) paints (i.e., less than 50 grams per liter of VOC) or, when feasible, no-VOC paints (i.e., less than 5 grams per liter of VOC) during construction. The Project Proponent				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		shall verify that the requirement to use low-VOC (and/or no-VOC) paints is identified in construction bids and on architectural plans. **Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations** All non-residential tenants must use certified (e.g., Greenguard or Green Seal) no-VOC paints (i.e., less than 5 grams per liter of VOC) where locally (i.e., within 50 miles of the Project Site) and commercially available for the coating type. Where not locally and commercially available, use low-VOC paints (i.e., less than 50 grams per liter of VOC). NASA shall require no-VOC and low-VOC paints as a condition of occupancy for all non-residential tenants. The Project Proponent shall require all janitorial contracts mandate use of water-based or low-VOC cleaning products. **Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations** All landscaping equipment must use zero-emission equipment over conventional gasoline-fueled counterparts. This includes all chainsaws, chippers, lawn mowers, leaf blowers/vacuums, riding mowers, tillers, trimmers, and any other equipment used to maintain landscaping features. Gasoline- or fossil-fuel-powered landscaping equipment during operations is prohibited. The Project Proponent shall require all landscaping contracts mandate use of electric equipment. **Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions** The Project Proponent shall offset combined construction and net partial operational ROG and PM_{10} emissions that exceed the Air District's annual thresholds to quantities below 10 tons and 15 tons				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		per year, respectively. The preferred means of undertaking such off-site mitigation will be through a partnership with the Air District's Clean Air Foundation (Foundation), as follows: ● The Project Proponent, or its designee, shall pay a mitigation fee and an administrative fee in accordance with the provisions of the Foundation's established mitigation fee program to reduce the project impacts from combined construction and net partial operational ROG and PM_{10} emissions to a less-than-significant level (i.e., below 10 tons and 15 tons per year, respectively). ● The Project Proponent, or its designee, shall pay the mitigation and administrative fees for each of the construction years, as determined by the Foundation, in full prior to NASA approval of the tentative map, parcel map, or planned development permit for the associated construction phase. ● An alternative payment plan may be negotiated by the Project Proponent, or its designee, based on the timing of construction activities or other construction phases that are expected to exceed the Air District's threshold of significance. Any alternative payment plan must be acceptable to the Air District and agreed upon in writing prior to NASA approval of the tentative map, parcel map, or planned development permit. The alternative payment plan must cover the full quantity of required offsets, and full payment must be provided prior to the completion of construction. ● In coordination with the Air District, the Project Proponent, or its designee, may reanalyze combined construction and net partial operational ROG and PM_{10} from the proposed project prior to starting construction to update the required mitigation and administrative fees.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		○ The analysis must be conducted using Air District approved emissions model(s) and the fee rates published at the time of reanalysis. ○ The analysis must use the latest available engineering data for the proposed project. Consistent with the methodology used in this joint EIR/EIS, emission factors may account for enacted regulations that will influence future year emissions intensities (e.g., fuel efficiency standards for on-road vehicles). ○ The analysis must include all required mitigation measures as specified in this joint EIR/EIS. The analysis may include additional measures to reduce construction emissions if deemed feasible and equally effective or superior by the lead agency and Project Proponent. All on-site measures assumed in the analysis must be included in the construction contracts and be enforceable by the lead agency. **Mitigation Measure AQ-8. Enhanced Dust Control** All project contractor(s) comply with the Air District's current enhanced control measures for fugitive dust. The Air District's current enhanced control measures are drawn from their 2023 CEQA Guidelines, Table 5-3, and are identified below. The requirement to comply with the control measures shall be identified in construction bids. ● Limit the simultaneous excavation, grading, and ground-disturbing construction activities occurring within 1,000 feet of one another. ● Install wind breaks (e.g., trees, fences) on the windward side(s) of actively disturbed areas of construction. Wind breaks should have at maximum 50 percent air porosity.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

		● Plant vegetative ground cover (e.g., fast-germinating native grass seed) in disturbed areas as soon as possible and watered appropriately until vegetation is established. ● Install sandbags or other erosion control measures to prevent silt runoff to public roadways from sites with a slope greater than one percent. ● Minimize the amount of excavated material or waste materials stored at the site. ● Hydroseed or apply non-toxic soil stabilizers to construction areas, including previously graded areas, that are inactive for at least 10 calendar days. **Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction.** The Project Proponent or its contractor(s) shall provide educational material for on-site workers on ways to reduce emissions exposure during construction of the proposed project as part of a pre-construction advisory that precedes construction of each phase. These materials shall provide recommendations to on-site workers (i.e., future employees of the proposed project) to reduce their exposure while indoors and outdoors. The information shall include recommendations to reduce emissions exposure and examples include the following: ● Keep doors and windows closed when working inside and active construction is taking place. ● Ensure any heating, ventilation, and air-conditioning (HVAC) systems in buildings on the Project Site are operating and fully functional when indoors.

		the types of sensitive resources in the project area and the measures required to avoid and minimize impacts on these resources. Materials covered in the training program shall include environmental rules and regulations, along with specific site requirements to limit activities to approved work areas; timing restrictions; and instructions regarding avoidance of sensitive resource areas. In general, the training shall include the following components: • A review of the special-status species and sensitive habitats that could be found in work areas, including known plant populations, bird nests or bat roosts, if present, and the location of burrowing owl preserves. • Measures to avoid or minimize impacts on special-status species and their habitats. • A review sf all conditions and requirements of environmental permits, reports, and plans. • Consequences for violations of the laws and regulations protecting resources. • Boundaries of the work area. • Exclusion and construction fencing methods and staking methods to protect resources. • Roles and responsibilities, including an explanation regarding the authority of biological monitors to stop work, as required by permits and/or project approvals. • What to do when special-status species are encountered (including dead, injured, stressed, or entrapped individuals) in work areas. **Mitigation Measure BIO-2. Preconstruction Surveys for Special-Status Species**				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		Prior to the start of construction in a work area for the current construction phase, preconstruction surveys shall be conducted for special-status plant and wildlife species by a qualified biologist(s) to inform implementation of avoidance and compensation measures that may be required if special-status species are observed. Alkali milk-vetch and Congdon's tarplant surveys shall be required in suitable annual grassland habitat within 100 feet of work areas for the current construction phase. The purpose of the surveys is to inform implementation of the avoidance and compensation measures described below if alkali milk-vetch or Congdon's tarplant are observed. Surveys shall be initiated during the identifiable period of the year that precedes construction of each phase and be consistent with the methods described in *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities* (California Department of Fish and Game 2018a). Surveys for special-status wildlife species (Crotch's bumble bee, monarch butterfly, northwestern pond turtle, snowy egret, northern harrier, white-tailed kite, California Ridgway's rail, western burrowing owl, Alameda song sparrow, tricolored blackbird, saltmarsh common yellowthroat, pallid bat, Townsend's big-eared bat, and hoary bat)shall be conducted consistent with available established survey protocols for each species, such as in *Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species* (California Department of Fish and Wildlife 2023), *Staff Report on Burrowing Owl Mitigation* (California Department of Fish and Game 2012), *Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions* (Johnston et al. 2019).				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		Mitigation Measure BIO-3. Exclusion Fencing Prior to the start of construction in a work area for the current construction phase, the Project Proponent or its contractor(s) shall install high-visibility exclusion fencing and erosion control measures prior to any ground disturbance within 50 feet of environmentally sensitive areas (i.e., potential emergent wetlands, native perennial grassland, special-status species' habitats) under the guidance of a qualified biologist. The fencing shall be installed around the perimeter of native perennial grassland, potential emergent wetlands (potential habitat for Ridgway's rail and northwestern pond turtle), and burrowing owl preserves. Flagging or other visual barriers and/or signs may be installed in place of fencing (e.g. in the case of burrowing owl preserves to prevent perching on fence stakes by avian predators). The contractor, under the supervision of a qualified biologist, shall erect and maintain the exclusion fencing for the duration of the construction activity in that work area. Fencing and erosion control measures shall be inspected and maintained daily by the construction foreman until completion of the construction activity. Status of the fencing and erosion control measures shall also be verified and documented at least once a week by a biological monitor. Fencing shall be removed upon completion of construction activities in that work area and prior to demobilization. Activity exclusion zones for sensitive natural communities shall be a minimum of 50 feet; the zones shall be established around each sensitive natural community, the boundaries of which shall be clearly marked with construction exclusion fencing or its equivalent. The establishment of activity exclusion zones shall not be required if construction-related disturbances shall not occur within 250 feet of the sensitive natural community. The size of activity exclusion zones may be reduced below 50 feet through consultation with a qualified biologist if construction activities are conducted in the presence of a biological monitor.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		Mitigation Measure BIO-4. Alkali Milk-Vetch and Congdon's Tarplant In the event that avoidance of alkali milk-vetch or Congdon's tarplant is not feasible, seeds of alkali milk-vetch and/or Congdon's tarplant shall be collected by a qualified biologist with experience collecting native plant seeds prior to the start of construction in a work area for the current construction phase. Seeds shall be stored and redistributed after the current construction phase is completed. Include the redistributed seeds in the planting palette for on-site restoration of temporarily disturbed grassland and/or the landscape design for open space, as described in the Development Guidelines. **Mitigation Measure BIO-5. Monarch Butterfly Breeding Habitat** Prior to the start of construction in a work area for the current construction phase, botanists shall identify and map locations of milkweed (monarch butterfly breeding habitat). If the Limits of Work overlaps with milkweed plants, milkweed plants shall be removed outside of the breeding season for monarch butterfly (February 15 through October 15). The Project Proponent shall compensate for the permanent loss of milkweed by planting native milkweed in the landscape design for open space at a ratio of 1:1 (one native milkweed planted for each milkweed plant removed) and by including native nectar plants for monarch butterfly such as goldenrods (*Solidago* spp.), asters (*Symphyotrichum* spp.; *Eurybia* spp.), coyotebrush (*Baccharis pilularis*), nettleleaf giant hyssop (*Agastache urticifolia*), yarrow (*Achillea millefolium*), coastal sand verbena (*Abronia latifolia*), bluedicks (*Dichelostemma capitatum*), seaside fleabane (*Erigeron glaucus*), coyote mint (*Monardella villosa*), gumplant (*Grindelia camporum*), and sunflowers (*Helianthus* spp.), among others (Xerces Society 2025) in planting palettes for on-site restoration of temporarily				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 		disturbed grassland, and/or the landscape design for open space, as described in the Development Guidelines. **Mitigation Measure BIO-6. Crotch's Bumble Bee** Prior to any phase of construction and as long as the species is considered a candidate for listing under the California Endangered Species Act (CESA) or in the event that they become listed under CESA, a qualified biologist shall assess the work area through a desktop analysis and land cover assessment through site visits to determine whether the work area for the current phase of construction and immediately surrounding landscape within 50 feet has the potential to contain potential habitat for Crotch's bumble bees. This analysis shall identify whether the work area is a developed area with no landscaping (i.e., contains buildings; paved roads, sidewalks or parking lots; other built infrastructure; or mowed and irrigated lawns) or contains open grassland, ornamental landscaping or scrub habitats that could be potential Crotch's bumble bee foraging, nesting, or overwintering habitat. If habitat suitable for Crotch's bumble bee is determined not to be present within the work area for the construction phase, then further measures would not be required. If the work area contains suitable Crotch's bumble bee habitat, then the following measures shall be implemented prior to construction of the phase. • Pre-construction surveys for Crotch's bumble bee and nests shall be conducted within all suitable habitat prior to initial ground-disturbing activities for the current construction phase. Surveys shall follow the survey methodologies set out in the CDFW *Survey Considerations for CESA Candidate Bumble Bee* (CDFW 2023). The surveys can be phased with project buildout. The purpose of this				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 		survey shall be to identify active nest colonies inside of and within 50 feet of permanent and temporary impact areas. If Crotch's bumble bees are not detected during the pre-construction survey, no additional measures are required. ● If active Crotch's bumble bee nests are present within the Limits of Work or a 50-foot buffer surrounding the Limits of Work, an appropriate no disturbance buffer zone shall be established around the nest to reduce the risk of disturbance or accidental take. The buffer shall provide at least 50 feet of clearance around nest entrances. ○ If establishment of a no-work buffer is feasible, construction activities shall not occur within the no-work buffer until a qualified biologist determines that the colony is no longer active (i.e., no Crotch's bumble bees are seen flying in or out of the nest for three consecutive days, indicating the colony has completed its nesting season, and the next season's queens have dispersed from the colony). Once the nest has been determined inactive, construction activities within the no-work buffer(s) shall be allowed to resume. ○ If avoidance of the nest is not feasible, the Project Proponent or its contractor(s) shall consult with a qualified biologist familiar with Crotch's bumble bee biology, regulations, and conservation for recommendations on appropriate measures. The proposed measures must be approved by the NASA Ames Research Center Environmental Management Division (NASA ARC EMD) prior to proceeding. ● Mowing shall be minimized as much as feasible in suitable Crotch's bumble bee habitat. In areas where mowing is needed, the following measures to minimize potential take of Crotch's bumble bee shall be followed to the extent feasible:				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 		○ Mow outside of the blooming season (typically March through June), if feasible; ○ Mow at the highest cutting height possible to avoid disturbing nests or overwintering queens; ○ Avoid mowing from noon into the afternoon, the time of day when pollinators are most active; and ○ Mow at speeds less than 8 mph. ● During construction, vehicles on-site shall not exceed a speed of 15 mph. This requirement shall be posted with signage noted throughout the Project Site **Mitigation Measure BIO-7. Herbicide and Pesticide Use** To minimize impacts on monarch butterfly and Crotch's bumble bee from herbicide and pesticide drift, application shall be limited to areas immediately adjacent to the proposed facilities and shall be conducted using handheld equipment. Herbicides and pesticides shall be applied only by applicators with current licenses and/or certifications from the California Department of Pesticide Regulation. The herbicide applicator shall follow the label directions. Spray nozzles shall be kept within 24 inches of target vegetation during spraying. The most current information on herbicide and pesticide toxicity on wildlife shall be used to inform future decisions about herbicide and pesticide use during operations. **Mitigation Measure BIO-8. Burrowing Owl Surveys** Prior to any ground disturbance for the current construction phase, a qualified biologist shall conduct pre-construction surveys in all areas identified as suitable habitat within 250 feet of the Limits of Work. Surveys shall be performed consistent with the methods described in the				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 		Staff Report on Burrowing Owl Mitigation (California Department of Fish and Game 2012). The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the Limits of Work of the construction phase, particularly in areas within 250 feet of construction activities. Surveys shall be initiated no less than 14 days prior to initial construction activities for the phase, and the final survey shall conclude no more than 2 calendar days prior to construction of the phase. **Mitigation Measure BIO-9. Burrowing Owl Avoidance** If active burrowing owl burrows are detected during preconstruction surveys, the following shall apply: If disturbance must occur within the breeding or non-breeding season buffer zones, the Project Proponent or its contractor(s) shall work with NASA Ames Research Center Environmental Management Division (NASA ARC EMD) prior to commencement of activities for each construction phase to adhere to and implement the following measures listed below. Alternative measures to avoid impacts may be considered on a case-by-case basis in coordination with NASA ARC EMD and the approved qualified biologist.[13] Prior to construction activity for the current construction phase within 250 feet of burrowing owl habitat, NASA ARC EMD must review and approve all vehicular access routes and staging areas.				

[13] As described in the NASA ARC Final Burrowing Owl Habitat Management Plan (NASA 2022), the qualified biologist must have 1) familiarity with the western burrowing owl biology and its local ecology (i.e., Santa Clara County); 2) at least 2 years of experience with conducting habitat assessments as well as breeding and non-breeding season surveys for burrowing owls, or experience with such surveys conducted under the direction of an experienced western burrowing owl biologist; 3) familiarity with regulations related to burrowing owls and conservation; and 4)experience with analyzing impacts of development on burrowing owls and their habitat.

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		Mitigation Measure BIO-10. Burrowing Owl Relocation If occupied burrowing owl burrows cannot be avoided (i.e., disturbance within 160 feet of active burrows during the non-breeding season or 250 feet of active burrows during the breeding season would occur), the following measures shall be implemented in coordination with and subject to the approval of NASA ARC EMD. 1. Passive Relocation a. Timing i. No passive relocation is allowed during the breeding season (February 1 through August 31). The destruction of burrows is only allowed outside the breeding season (September 1 through January 31). All artificial burrows shall be installed prior to the breeding season. ii. Installation of artificial burrows must occur prior to activities that cause disturbance. A project is not allowed to proceed until NASA ARC EMD has verified the artificial burrows have been installed. iii. Installation of artificial burrows must occur at least 1 week prior to passive relocation and burrow exclusion activities. b. Surveys and Banding i. The approved qualified biologist must conduct multiple surveys for a minimum of 2 weeks prior to the passive relocation. These surveys need to locate active burrows within the Limits of Work and buffer zone, identify satellite burrows outside the buffer zone, and observe owl behavior to establish the territory of the owl. ii. Before passive relocation occurs, owls should be trapped and banded, at the discretion of the NASA ARC EMD, to track success. At least 2 weeks prior to exclusion, all owls may be banded by an approved qualified biologist who has				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		a minimum of 2 years of bird banding experience and a Federal Bird Banding and Marking Permit. c. Restrictions i. Passive relocation should only be allowed if satellite burrows are located outside the 50-foot buffer zone to increase the chances of success. All passive relocation efforts must be coordinated with and approved by NASA ARC EMD. ii. Burrows associated with ground squirrel colonies (i.e., dense clusters of interconnecting burrows that support multiple ground squirrels) must be protected to the extent they do not conflict with NASA infrastructure protection and aircraft safety requirements. 2. Exclusion Requirements a. Short-term exclusion (for 1 to 4 weeks) must be avoided to the extent feasible and is only allowed if avoidance measures are not practicable. If short-term exclusion is the only available mechanism, install a one-way door, and once the owl leaves, collapse the burrow within the 1-4 week duration. Long-term exclusion (more than 4 weeks) is prohibited. If exclusion more than 4 weeks is necessary, passive relocation measures shall be implemented. i. Burrowing owls may only be temporarily excluded from burrows in the Limits of Work and 50-foot buffer zone. ii. Restoration. Burrows within the Limits of Work and 50-foot buffer that are temporarily excluded (i.e., not destroyed) must be restored to pre-project conditions (e.g., removal of wood blocks/one-way doors, digging out burrows by hand, and relocating squirrels to the area) in coordination with NASA ARC EMD.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		b. Exclusion Procedures i. Exclusion shall be conducted by installing one-way doors in burrow entrances. One-way doors shall be left in place for a minimum of 48 hours to ensure owls have left the burrow before excavation. ii. The approved qualified biologist shall remove the one-way doors and verify that no owls are present before excavating the burrows. All burrows shall be excavated immediately after removal of the one-way doors. c. Re-entry Prevention i. If project activities do not occur within 5 days of removing the one-way doors, the Limits of Work and 250-foot buffer zone shall be resurveyed to verify that burrowing owls have not reoccupied the site. ii. The Limits of Work and 250-foot buffer zone shall be resurveyed if the site remains inactive for more than 2 weeks during construction to ensure owls have not occupied the site in the interim period between the initial surveys and ground-disturbing activities. 3. Artificial Burrows a. Replacement Ratio. Active natural and artificial burrows (i.e., burrows that have been active during the breeding season within the last 5 years) that are permanently excluded (i.e., destroyed) shall be replaced with artificial burrows at a 3:1 ratio. b. Siting and Design. Artificial burrows must be installed within approximately 300 feet of the burrows to be destroyed, if feasible. If this distance is not feasible, the Project Proponent or its contractor(s) must coordinate with the approved qualified biologist to locate alternate sites (e.g., within				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		burrowing owl preserves or other burrowing owl habitat). The location(s) and design of the artificial burrows will be developed in coordination with the NASA ARC EMD prior to installation. c. Monitoring. Subsequent to installation of artificial burrows, the Limits of Work, buffer zone, and surrounding area must be monitored daily for at least 1 week to confirm owl use of the alternate burrows before destroying burrows in the Limits of Work. Burrow exclusion is not allowed until owl use of the artificial burrows and/or satellite burrows is confirmed by the approved qualified biologist. d. Management. Activities must be minimized around the new artificial burrows, and these areas need to be managed to provide foraging habitat to the extent possible. **Mitigation Measure BIO-11. Burrowing Owl Habitat** If suitable burrowing owl habitat is temporarily disturbed or permanently lost or degraded (as determined by the qualified biologist and approved by NASA ARC EMD), the following measures shall be implemented. 1. Suitable burrowing owl habitat lost from project impacts shall be replaced at a 3:1 mitigation ratio. 2. All suitable burrowing owl habitat temporarily disturbed by ground-disturbing activities must be restored with native grasses and habitat (e.g., rocks, mulch, berms) to attract native insects and rodents and facilitate repopulation of ground squirrels. 3. The location of habitat restoration area(s) must be approved by the NASA ARC EMD.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		4. Initial restoration activities associated with permanent habitat loss must commence prior to construction. NASA ARC EMD must verify that restoration activities have been initiated prior to construction activities. 5. Recommended native plant species include but are not limited to meadow barley, purple needlegrass, coast range melic, California poppy, California brome, Molate red fescue, monkey flower, purshings lotus, deerweed, Farewell to Spring, sky lupine, and small fescue. 6. Native seed dispersal within selected restoration areas should be scheduled for the beginning of the winter rainy season. If seed dispersal occurs during the dry months, irrigation shall be necessary. 7. All restoration areas must be maintained and monitored for up to two years to ensure the long-term success of the restoration (i.e., restoration areas provide suitable habitat for burrowing owl). The approved qualified biologist must conduct inspections (at a frequency agreed upon by the NASA ARC EMD) and coordinate maintenance requirements with the Project Proponent or its contractor(s). If restoration and/or ground squirrel repopulation efforts are not successful, the Project Proponent or its contractor(s) shall coordinate with NASA ARC EMD to evaluate and implement additional activities (including potential ground squirrel relocation) to ensure the continued success of the restoration. **Mitigation Measure BIO-12. Nesting Birds** Timing Restrictions. To the maximum extent feasible, as determined by the contractor in coordination with a qualified biologist, construction activities, vegetation removal, and trimming shall be scheduled during the nonbreeding season of birds (September 1				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		through January 31) to avoid impacts on nesting birds if nesting birds are present. If construction activities, vegetation removal, and trimming cannot be conducted in accordance with this timeframe, surveys for nesting birds and additional protective measures shall be implemented as described below. Preconstruction Surveys. A qualified wildlife biologist with knowledge of avian species and their behavior shall conduct nesting surveys before the start of each construction phase from locations where access is allowed. A minimum of three separate surveys shall be conducted within 30 days prior to construction of each phase, with the last two surveys conducted within 7 days and 3 days prior to construction. Surveys shall be conducted within the project construction and staging areas as well as all suitable nesting habitat (e.g., trees, shrubs, potential emergent wetland, grasslands, ruderal areas, cultivated lands, human-made structures) within 500 feet of the project construction and staging areas for the current construction phase to locate any active nest protected by the MBTA or by CDFW. If no active nests are detected during these surveys, no additional measures shall be required if construction begins within 3 calendar days. An additional survey shall be conducted after any construction breaks of 3 calendar days or more. Non-Disturbance Buffer. If active nests are found in the survey area, non-disturbance buffers shall be established around the nest sites to avoid disturbance or destruction of the nest site until the end of the breeding season (September 1) or until a qualified wildlife biologist determines that the young have fledged and moved out of the work area (this date varies by species). Buffer distances vary by species and conservation status (e.g., listed species and fully protected species, for which take is prohibited, may warrant larger buffers than non-special-status species), but typically, these buffer distances are between 300 and 650 feet for raptors and between 50 and 250 feet for other nesting				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		birds. The extent of the buffers shall be determined by the qualified wildlife biologist(s) and established by taking into consideration the type and extent of the proposed activity occurring near the nest, the duration and timing of the activity, the line of sight between the nest and the disturbance, the sensitivity and the habituation of the birds and raptors to existing conditions, and the dissimilarity of the proposed activity to ambient levels of noise and other disturbances. The qualified wildlife biologist(s) shall mark the extent and locations of non-disturbance buffers on maps that shall be presented to construction personnel at morning tailboards or use flagging, fencing, or other suitable physical markers, depending on the species of birds, the size of the buffers, and the construction activities to be conducted in the work area. Nest Monitoring. The qualified wildlife biologist(s) shall monitor the nests to ensure that construction activities shall not affect nest success. Buffers (described above) may be reduced if a full-time qualified biologist is present to monitor the nest. Active nests shall be monitored to track progress of nesting activities until the biologist determines that the young have fledged and are capable of independent survival or the nest site is no longer active. Monitoring will be conducted from locations where access is allowed. Authority of Qualified Wildlife Biologist(s). If, during construction, the qualified wildlife biologist(s) determines that a nesting bird is disturbed by construction activities to the point where continued activities could lead to nest failure, the qualified wildlife biologist(s) shall have the authority to immediately stop work and provide additional protective measures (including increasing the non-disturbance buffer distance) that need to be implemented and continue monitoring the nest until determining that bird behavior has normalized.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		Mitigation Measure BIO-13. Roosting Bats To avoid take of roosting bats, a preconstruction survey of buildings to be demolished or trees to be trimmed or removed shall be conducted in areas affected by the current construction phase by a qualified wildlife biologist in accordance with *Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions* (Johnston et al. 2019). If special-status roosting bats are found, an avoidance or mitigation plan prepared by a qualified wildlife biologist shall be developed and implemented to avoid take of roosting bats. Avoidance measures may include conducting construction, demolition, tree-trimming or tree-removal outside of hibernation (January – February) and maternal roosting (March 1- August 31) time periods and excluding bats from buildings after they have left the roost to forage at night by closing entrances. Mitigation may include the construction of bat boxes to accommodate displaced bats. If bat boxes are used, their success shall be monitored and reported to the NASA ARC EMD.

Cultural Resources (CEQA)						
Impact CEQA-CUL-1: The project would cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.3.	PS	**Mitigation Measure CUL-1. Protect and Reinstall Shenandoah Plaza Streetlights** Prior to the issuance of permits for work occurring in the Clar Road, Wescoat Road, and Cummins Avenue roadways, the Project Proponent shall submit site plans for review and approval by the NASA ARC cultural resources manager to ensure that historic streetlights are retained in their current locations at the conclusion of project construction. This measure applies to the 17 streetlights installed during the 1930s that line Clark Road, Wescoat Road, and Cummins Avenue. The Project Proponent shall also incorporate into contract specifications a requirement that the contractor(s) prepare a written protection plan that outlines the methods and equipment to be undertaken so that equipment and vibration-related damage to the streetlights is avoided during construction. Such methods may include staging equipment and materials so as to avoid direct damage, installing physical barriers, and temporarily stabilizing the area, as deemed appropriate by the contractor. Specifications shall also	SUM	Same	Same	Same

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		stipulate that any damage incurred to historic properties as a result of construction activities shall be reported to the NASA ARC cultural resources manager. The site plans and contract specifications shall be reviewed and deemed adequate by the NASA ARC cultural resources manager prior to the issuance of permits. If damage to a streetlight occurs during construction, the Project Proponent shall engage a qualified professional who meets the standards for historical architecture, as set forth by the Secretary of the Interior's Professional Qualification Standards (36 Code of Federal Regulations, Part 61), to assess the damage and provide treatment recommendations. Damage incurred to the resource shall be repaired according to the Secretary of the Interior's Standards in consultation with the qualified professional and NASA ARC cultural resources manager. **Mitigation Measure CUL-2. Review Project Design for Architectural Compatibility** To ensure the designs of project buildings adjacent to the NAS Sunnyvale Historic District (i.e., along Wescoat Road and Cody Road) areinformed by the Secretary of the Interior's Standards, the Project Proponent shall retain a qualified professional to consult on and evaluate project construction plans at conceptual design, schematic design, and permit submittal phases. The purpose of this mitigation measure is to promote architectural compatibility between project buildings and the historic district, on balance with appropriate differentiation. This mitigation measure establishes a review process that applies only to exterior building façades that are most immediately visible from the historic district (i.e., the northernmost 150 feet of Subareas 1, 2, and 6, as well as the easternmost 150 feet of Subarea 3). The qualified professional shall meet the Secretary of the Interior's				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		Professional Qualifications Standards (36 CFR Part 61) for architectural history or historic architecture. In coordination with the Schematic Design Review process required by the NASA Research Park (NRP) Design Review Board (pursuant to AMES Procedural Requirement 8822.1), the qualified professional shall provide input during the development of the conceptual design of exteriors of project buildings in Subareas along Wescoat Road and Cody Road (adjacent to the NAS Sunnyvale Historic District) using the Secretary of the Interior's Standards (particularly Standard 9). Input on the exteriors of project buildings may relate to massing, fenestration patterns, entry placement, exterior materials, and façade articulation. Following completion of conceptual design, the qualified professional shall prepare a memorandum that analyzes the compatibility of project building design elements that have been developed. If the design of project buildings does not comply with the Secretary's Standards, the qualified professional shall provide recommendations for modifying the project building design to improve its compatibility with the historic district. The memorandum shall be included in the Conceptual Design Phase submittal, and the NASA ARC cultural resources manager shall review and provide comments on the analysis during the Conceptual Design Review process. The Project Proponent shall incorporate the recommended design changes that are feasible while also meeting the objectives of the project (i.e., do not conflict with code requirements or remove programmatically necessary amenities). The Project Proponent shall provide a response documenting the reasons any recommendations are not feasible and cannot be incorporated into the project design. The qualified professional shall prepare memoranda that document and analyze the schematic design and permit submittal documents to address any subsequent design changes with the potential to cause				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

		visual effects on the NAS Sunnyvale Historic District that occurred from previous review. Each analysis shall be submitted to the Project Proponent and NASA ARC cultural resources manager. Should NASA ARC disagree with any conclusions in the analysis, they shall notify the Project Proponent within 2 weeks of NASA's receipt of the memo of proposed design changes. The plans shall not be resubmitted, but those changes shall be incorporated into the next plan submission. Prior to the issuance of a building permit, NASA cultural resources staff must sign-off that the final permitted plans have been developed with the greatest possible adherence to the objectives defined in the design review process while also meeting project objectives. NASA shall notify ARC Center Consulting Parties under the NASA-Wide Programmatic Agreement, as appropriate, of the approval of construction documents and shall distribute the approved memorandum to demonstrate compliance with this measure. **Mitigation Measure CUL-3. Develop and Implement an Interpretive Program** The Project Proponent shall develop and implement an interpretive program that documents and commemorates the historical development and setting of the NAS Sunnyvale Historic District. Interpretive materials shall address the general history of NAS Sunnyvale and incorporate visual representations of the installation's historical setting (including the Project Site) during the interwar, World War II, and early Cold War periods. Interpretive media may include on-site displays placed in visible and accessible locations and/or digital platforms (i.e., using a mobile device application). An interpretive plan shall be prepared in coordination with an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards and an exhibit designer,				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

		graphic designer, and/or other professional with historical interpretation design experience. The interpretive plan shall describe, at a minimum, the proposed location(s), formats/media, and content themes of interpretive materials. The NASA ARC cultural resources manager shall advise on whether the interpretive plan shall be developed in coordination with separate interpretive requirements (i.e., public interpretation of archaeological materials required by the Cultural Resources Treatment and Monitoring Plan). Representatives from the Moffett Field Museum shall be invited to collaborate on the interpretive plan to ensure that proposed materials and themes are coordinated with existing or planned interpretive efforts at NASA ARC. The interpretive plan shall be reviewed and approved by the NASA ARC cultural resources manager. Following approval of the interpretive plan, the qualified historian and designer shall then develop detailed interpretive content, including text and images, and applicable design specifications for the interpretive materials. The NASA ARC cultural resources manager shall review and approve the text, images, and applicable design specifications prior to production and installation or publication of the interpretive materials and prior to the completion of the first construction phase. Implement **Mitigation Measure NOI-5. Construction Vibration Control Plan for Vibratory Rollers**, below.				
Impact CEQA-CUL-2: The project would cause a substantial adverse change in the significance of an archaeological historical resource pursuant to Section	PS	**Mitigation Measure CUL-4. Cultural Resources Treatment and Monitoring Plan** Prior to any ground-disturbing activity, the Project Proponent shall retain a qualified Archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (qualified Archaeologist) to develop a Cultural Resources Treatment and	SUM	Same	Same	Same

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 15064.5 or a unique archaeological resource (PRC Section 21083.2).		Monitoring Plan (CRTMP) in consultation with the Project Proponent, NASA, and ARC Center Consulting Parties under the NASA-Wide Programmatic Agreement, as appropriate. The CRTMP shall specify the procedures to be used to implement the mitigation measures or conditions of approval in the field, the standards of evaluation for unanticipated discoveries that shall be appropriate given the locations and kinds of cultural properties predicted, and treatment methods for resources determined eligible for the National Register of Historic Places (NRHP). The CRTMP shall meet the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (U.S. Department of the Interior, National Park Service, 1983, as amended and annotated). Within each construction phase, all actions mandated in the CRTMP shall be implemented after demolition, but before any other ground-disturbing activities (e.g., grading, trenching), except for the activities as noted below. The CRTMP shall include descriptions and/or summaries of:
		● The proposed project and its subsurface impacts;
		● The proposed project's regulatory requirements;
		● Known cultural resources in the APE and ADI;
		● Canine Forensic Survey Alert Results and Interpretations;
		● Archaeological Site Sensitivity Assessments;
		● A Monitoring Plan that includes:
		  ○ A definition of the Cultural Resources Monitoring Area (CRMA)
		  ○ Requirements for cultural resources sensitivity training
		  ○ Requirements for tribal resources sensitivity training, monitoring schedules, consultation requirements, procedures for addressing tribal resource discoveries made during construction, documentation requirements				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

		The qualified Archaeologist shall also oversee archaeological monitor who shall be present during ground disturbing activities (e.g., demolition activities that involve ground disturbance, clearing/grubbing, grading, trenching) within the Cultural Resources Monitoring Area (CRMA), as defined the CRTMP. Native American tribal representatives from the Costanoan Rumsen Carmel Tribe, Muwekma Ohlone of the San Francisco Bay Area, and Tamien Nation shall also monitor ground disturbing activities in the CRMA on a rotating basis. Tribal monitoring shall also be required for all archaeological testing and data recovery. In addition, cultural resources sensitivity training shall be pre-recorded for presentation to all construction personnel. The training shall be prepared by the qualified Archaeologist and representatives from the Native American tribes, focusing on how to identify cultural resources that may be encountered during earthmoving activities and the procedures to be followed in such an event. The pre-recorded training materials and a sign-in sheet from the training shall be provided to the Project Proponent to ensure compliance with this mitigation measure. The qualified Archaeologist shall prepare a monitoring report at the conclusion of archaeological monitoring. Tribal representatives from the Costanoan Rumsen Carmel Tribe, Muwekma Ohlone of the San Francisco Bay Area, and Tamien Nation shall review and provide comments on the monitoring report. The final monitoring report shall be submitted to Northwest Information Center (NWIC) and participating Native American communities. The monitoring program and report shall be completed prior to occupancy of Phase 4. **Mitigation Measure CUL-6. Cultural Resources Inadvertent Discoveries Protocols**				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. 	Significance before Mitigation	**Mitigation Measures**	**Significance after Mitigation**			
site or unique geologic feature.						
Greenhouse Gas Emissions (CEQA)						
Impact CEQA-GHG-1: The project could generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.	PS	**Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions** All project contractor(s) shall comply with the Air District's current best management practices (BMPs) for construction-related GHG emissions. The Air District's current BMPs are drawn from their 2023 CEQA Guidelines, Table 6-1, and are identified below, as applicable. Where relevant, air quality mitigation that requires actions equal to or greater than the recommended BMPs are referenced in place of the specific BMP language. The requirement to comply with the control measures included in this mitigation will be identified in construction bids. ● Per Mitigation Measure AQ-1, use zero-emission and hybrid-powered equipment. Require Tier 4 Final compliant engines and renewable diesel for remaining diesel off-road equipment. Prohibit off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day. ● Minimize diesel equipment idling time either by shutting equipment off when not in use or reducing the time of idling to no more than 2 minutes (A 5-minute limit is required by the state airborne toxics control measure [Title 13, Sections 2449(d)(3) and 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site and develop an enforceable mechanism to monitor idling time to ensure compliance with this measure. ● Require all construction equipment is maintained and properly tuned in accordance with manufacturer's specifications.	LTSM	Same	SUM	SUM

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		Equipment should be checked by a certified mechanic and determined to be running in proper condition prior to operation. ● Require compliance with Mitigation Measure AQ-2 regarding use of zero-emission on-road vehicles during construction, including vehicles used for deliveries and hauling. ● Implement the TDM Plan and comply with the expanded requirements per Mitigation Measure TRAN-1. ● Where grid power is available, provide electrical hook ups for electric construction tools, such as saws, drills and compressors, and using electric tools whenever feasible. Prioritize the use of use alternative fuels, such as propane or solar electrical power where feasible, for generators at construction sites. ● Reduce electricity use in the construction office by using efficient lighting technologies, including, but not limited, to LED technology, powering off computers every day, and utilizing efficient heating and cooling units. ● Minimize energy used during site preparation by deconstructing existing structures to the greatest extent feasible. ● Use locally sourced or recycled materials for construction as commercially and financially available and feasible at the time of construction. Wood products used should be certified through a sustainable forestry program. ● Use low-carbon concrete, minimize the amount of concrete used and produce concrete on-site if it is more efficient and lower emitting than transporting ready-mix, as commercially and financially available and feasible at the time of construction. ● Develop a plan to efficiently use water for adequate dust control since substantial amounts of energy can be consumed during the pumping of water.

new land uses incompatible with established uses at or surrounding Ames Research Center.						
Noise (CEQA)						
Impact CEQA-NOI-1a: The project would generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards or other agencies, from project construction.	PS	**Mitigation Measure NOI-1. Construction Noise Control Plan** The Project Proponent or its project contractor(s) shall develop a construction noise control plan to reduce noise levels to a level below the limits defined in the County Code, as well as FTA noise limits for daytime and nighttime construction noise, to the extent feasible (i.e., to the greatest extent practicable without impairing the contractors' ability to safely and effectively construct the project, causing unreasonable inefficiencies in the project's construction schedule, or substantially increasing costs such that they are not commensurate with the noise reduction achieved). Further, the plan shall include measures to reduce construction noise levels such that a 10 dB or greater increase over the existing ambient noise level shall not occur at the nearest sensitive uses, to the extent feasible (as defined previously). The final construction noise control plan shall be provided to and approved by NASA at the time of construction permit applications for each building and/or phase of development. The plan shall include measures to reduce daytime construction noise to the following, to the extent feasible (as defined previously): ● 65 dBA L_{eq}, or less, at the nearest multi-family residences, per the County Code (noting that noise levels below this limit would also ensure that noise levels would be below the FTA limit for daytime noise of 90 dBA L_{eq}, or less, at the nearest residences) ● Less than 10 dB greater than the existing daytime ambient noise level	SUM	Same	Same	Same

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		The plan shall also include measures to reduce nighttime noise levels to the following, to the extent feasible (as defined previously): ● 55 dBA L_{eq}, or less, at the nearest multi-family residences, per the County Code (noting that noise levels below this limit would also ensure that noise levels would be below the FTA limit for nighttime noise of 80 dBA L_{eq}, or less, at the nearest residences) ● Less than 10 dB greater than the existing nighttime ambient noise level In order to assess construction noise increases relative to existing ambient noise levels, measurements obtained as part of this study may be used to define daytime and nighttime ambient noise levels. Alternatively, additional ambient noise measurements may be conducted as part of the construction noise control plan to further refine the ambient noise levels. Techniques to reduce noise from construction activities to the relevant levels shall be incorporated into the plan and include, at a minimum, the following: ● Any construction activity that is not required to occur outside of typical construction hours due to technical or safety reasons (such as concrete pours or off-site utility installations) shall be conducted between 7:00 a.m. and 7:00 p.m. Monday through Saturday (excluding legal holidays), noting that construction would not occur on Saturdays. Material/equipment deliveries shall not be permitted at the job site before 7:00 a.m. or after 7:00 p.m. ● The noisiest construction activities shall be planned to occur during daytime hours when people are less sensitive to noise, when existing ambient noise levels are higher, and when quantitative noise standards pertaining to construction are less stringent.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		● The quietest available type of construction equipment readily available to the construction contractor shall be used. This applies to both stationary equipment (e.g., compressors) and mobile equipment (e.g., forklifts). Newer equipment is generally quieter than older equipment, electrically powered equipment is typically quieter than diesel, and hydraulically powered equipment is typically quieter than pneumatic. If compressors powered by diesel or gasoline engines are to be used, they shall be contained or have baffles to help abate noise levels. ● Require all construction equipment to be equipped with mufflers and sound control devices (e.g., intake silencers and noise shrouds) that are in good condition (at least as effective as those originally provided by the manufacturer) and appropriate for the equipment. ● Maintain all construction equipment to minimize noise emissions. ● Locate construction equipment (particularly stationary equipment, such as generators or compressors, that may operate at the same location for an extended period of time) as far as feasible from adjacent or nearby noise-sensitive receptors (e.g., as far as feasible from the western edge of the Project Site). ● Require stationary noise sources associated with construction (e.g., generators and compressors) in proximity to noise-sensitive receptors to be muffled and/or enclosed within temporary enclosures and shielded by barriers, which can reduce construction noise by 5 to 10 dB. ● Limit the use of impact tools (e.g., jack hammers) during nighttime/non-standard daytime hours as feasible. ● Prohibit idling of inactive construction equipment for prolonged periods during both daytime and nighttime/non-standard hours (i.e., more than 2 minutes).				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

		● Reduce noise from backup alarms (to the extent feasible without resulting in safety concerns) on construction vehicles and equipment by: ○ Providing a construction site layout that minimizes the need for reversing construction vehicles, or ○ Setting backup alarm noise levels to the minimum necessary for safe operation, ○ Using white-noise backup alarms, when feasible and safe, or ○ Using flagmen to keep the area behind maneuvering vehicles clear and minimize the time needed to back up vehicles. ● A construction notice shall be prepared that describes the project and the construction schedule, including the various types of activities that would occur throughout the construction period. The notice shall provide the name and telephone number of an on-site construction liaison. The notice shall be delivered to all property owners and residents within 500 feet of the Project Site at least 14 days (two weeks) before the start of construction. The contact information shall also be posted on a sign at each entrance to the construction site from the public right-of-way; the sign shall be large enough to be legible from the public right-of-way. If construction noise is found to be intrusive to the community (i.e., if complaints are received), the construction liaison shall take reasonable efforts to investigate the source of the noise and require reasonable measures be implemented to correct the problem. **Mitigation Measure NOI-2. Temporary Noise Barriers** Prior to the start of construction in each Subarea, the Project Proponent or its contractor(s) shall install temporary noise barriers. The barriers shall be located along all portions of the western and				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

		southern construction Subarea perimeters that are within 1,400 feet of the Wescoat Village receptors. Each barrier shall be a minimum of 8- to 12-feet tall and constructed of material with a surface weight of at least 1 to 1.5 pounds per square foot and a Sound Transmission Class (STC) of at least 25 . There should be no gaps or openings from the ground to the top of the barrier or along the length of the barrier. The barrier shall be constructed with plywood supported on a wood frame, acoustical blankets supported on a frame or metal construction fence, or another type constructed with comparable material. A barrier may need to be temporarily moved or removed when it physically interferes with construction activities (e.g., the barrier is located on top of an area where a curb or sidewalk is to be constructed). Barriers are not required where complete project building(s) (i.e., complete with solid exterior facades, including all exterior walls and windows) fully block the line of sight from sensitive receptors to active construction areas. However, barriers are required where there are gaps or there are other locations where the line of sight is not fully shielded by complete project building(s).				
Impact CEQA-NOI-1b: The project could generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards or other agencies, from project operation.	PS	**Mitigation Measure NOI-3. Design and Install Mechanical Equipment to Comply with Noise Standards** Prior to the issuance of building permit(s) for each project building that would include mechanical equipment, the Project Proponent or its contractor(s) shall retain a qualified acoustical consultant to prepare an acoustical report and address mechanical equipment noise issues, based on the selected equipment models and design features. The analysis of mechanical equipment noise and emergency generator noise, required under Mitigation Measure NOI-4, could be completed by the same consultant and presented in a single report. The final report, including the analysis results and any recommended noise control measures, shall be provided to and approved by NASA at the	LTSM	Same	Same	Same

	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		input from a qualified historical architect and the construction contractors and submitted to NASA for review and approval prior to the start of construction with vibratory rollers within 22 feet of Vibration-Sensitive Structures (expected to include Buildings 6, 16, and 510). The Project Proponent shall incorporate a requirement into construction specifications for the proposed project for the construction contractor(s) to use all feasible means to avoid damage to the nearby Vibration-Sensitive Structures without resulting in safety concerns. For the purposes of this mitigation measure, feasible is defined as being possible without impairing the contractors' ability to safely and effectively construct the project, causing unreasonable inefficiencies in the project's construction schedule, or substantially increasing costs such that they that are not commensurate with the vibration reduction achieved. Methods to reduce vibration-related damage effects may include using smaller and less vibration-intensive equipment in proximity to the potentially affected building. The construction contractor shall implement a monitoring program to minimize damage to adjacent buildings and ensure that any such damage is documented and repaired. The monitoring program shall include the following components: • Prior to the start of any construction activity that includes the use of a vibratory roller within 22 feet of a Vibration-Sensitive Structure (expected to include Buildings 6, 16 and 510), the construction contractor shall engage a structural engineer or other professionals with similar qualifications to document and photograph the existing conditions of potentially affected buildings within 22 feet of areas where the use of a vibratory roller is proposed.				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		• Based on the type, age, and existing condition of Buildings 6, 16, and 510 as observed during pre-construction surveys, the qualified vibration expert, in conjunction with project architectural historians and/or structural engineers, may establish a building-specific maximum vibration threshold for each building that shall not be exceeded during construction. The Caltrans criterion for "historic and some old buildings" (PPV limit of 0.25 in/sec, as shown in Table 4-4), shall be used as the default criterion unless otherwise justified. Any such adjustment shall be documented and approved by NASA prior to construction. • To ensure that vibration levels do not exceed the established standard, the Project Proponent shall monitor vibration levels at Buildings 6, 16 and 510 when a vibratory roller is used within 22 feet of said structures, and prohibit vibratory construction activities that generate vibration levels in excess of the applied standard. • Should vibration levels be observed in excess of the applicable standard, construction shall be temporarily halted to the extent feasible (i.e., when it is safe to do so), and alternative construction techniques used, to the extent feasible (i.e., if using alternative construction techniques, such as a static roller in lieu of a vibratory roller).				

Note: The summary of impacts, impact statements, and mitigation measures for the CEQA Proposed Project also applies to the CEQA Proposed Project with the Variant, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. Levels of significance are categorized as follows: (NI) No impact, (LTS) Less than Significant, (PS) Potentially Significant, (LTSM) Less than Significant with Mitigation, (SU) Significant and Unavoidable, and (SUM) Significant and Unavoidable with Mitigation.

Impacts	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Proposed Project with the Variant (NEPA Build Alternative 1 with the Sub-Alternative)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)	CEQA Reduced Density Alternative with the Variant (NEPA Build Alternative 2 with the Sub-Alternative)
	Significance before Mitigation	Mitigation Measures	Significance after Mitigation			
		• A structural engineer shall conduct an initial inspection of the Vibration-Sensitive Structure for damage within 7 days of construction within 22 feet of said buildings (i.e., Buildings 6, 16 and 510). If damage is observed at the initial inspection, additional inspections should be conducted every 7 days (for as long as that activity at that location takes place) to evaluate if further damage has occurred. However, if no damage occurs to a given building within the first 7 days of a given construction activity at a given location, the 7-day inspection period may be increased to 30 days for that activity (i.e., the subsequent inspection could take place 30 days after the initial inspection). • Should damage to a Vibration-Sensitive Building occur and be identified during the inspections described above, the damage shall be remediated to bring the Vibration-Sensitive Building to its pre-construction condition at the conclusion of ground-disturbing activity on the site. **Mitigation Measure NOI-6. Vibration Control Plan for Sensitive Equipment** Prior to the start of construction activities, the Project Proponent or its contractor(s) shall retain a qualified vibration expert to prepare a vibration control plan for sensitive equipment. The plan shall be designed to minimize construction-related vibration effects on nearby facilities housing vibration-sensitive research equipment (including, but not necessarily limited to, USGS Building 800). The plan shall include the following requirements and components: ● Conduct a pre-construction survey identifying and documenting the location, type, and sensitivity of vibration-sensitive equipment within potentially affected off-site laboratory buildings. Where

		▪ The most demanding criterion for extremely vibration-sensitive equipment. Note that, when determining applicable thresholds, consideration should be given to background pre-construction vibration levels at a given building; the lowest vibration standard established shall not exceed the previously established background vibration levels for a given laboratory. ● Identify construction equipment with the potential to exceed vibration thresholds and specify minimum setback distances or alternative low-vibration equipment to be used near sensitive facilities, as feasible. Feasibility considerations include that specified restrictions shall not unduly restrict the contractors' ability to safely and effectively construct the project, cause unreasonable inefficiencies in the project's construction schedule, or substantially increase costs that are not commensurate with the reduction in vibration levels achieved. ● Implement real-time vibration monitoring at potentially affected laboratory buildings during high-vibration construction activities for the duration of project construction. Note that the plan may include adaptive management and monitoring provisions to adjust requirements, based on observed results. For instance, vibration thresholds may be relaxed if monitoring confirms no adverse effects on the performance of specific equipment. ● Designate a vibration complaint coordinator to serve as the primary point of contact for nearby vibration-sensitive facilities. Contact information for the project vibration coordinator shall be posted at the Project Site and on a publicly available project website. The project vibration coordinator shall be contacted if vibration effects disrupt technical activities at nearby laboratory uses. The project vibration coordinator shall then work with the

Chapter 1
Introduction and Organization of Document

Moffett Partners, LLC (Project Proponent), a joint venture of The Regents of the University of California (UC Regents) and SKSP NRP, LLC, is proposing a master-planned mixed-use academic and research project, referred to as the Berkeley Space Center at the National Aeronautics and Space Administration (NASA) Research Park (NRP) (proposed project/proposed action).[1] The Project Proponent will require authorization from the UC Regents to proceed with the proposed project under the California Environmental Quality Act (CEQA) and NASA's approval to proceed following analysis consistent with the National Environmental Policy Act (NEPA).

The proposed project under consideration by NASA (i.e., the proposed action) would include academic and research facilities, consisting of offices, laboratories, research-and-development (R&D) uses, and related amenities (collectively, "Research and Office Uses"); conference center and related amenities ("Conference Uses"); ground-floor retail, food and beverage, maker spaces (i.e., collaborative work spaces for using various tools and materials), and other complementary accessory uses that would be publicly accessible (collectively, "Active Uses"); student/faculty housing, including associated amenities ("Student/Faculty Housing"); short-term lodging, including associated amenities ("Short-Term Lodging"); transportation networks; and open spaces, as well as landscaped spaces, to create a state-of-the-art research and education hub that shapes the future of technology and innovation and advance the UC Regents educational, scientific research, charitable, and other exempt purposes (within the meaning of Section 501(c)(3) of the United States Internal Revenue Code). The proposed project would facilitate the development and long-term operation of a collaborative research environment at the National Aeronautics and Space Administration Ames Research Center (NASA ARC) that supports NASA's position at the forefront of technological innovation and as a catalyst for space and aeronautical research.

The University of California, Berkeley (UC Berkeley) (on behalf of UC Regents) and NASA are preparing this joint environmental impact report/environmental impact statement (joint EIR/EIS) to assess potential environmental impacts that could result from implementation of the proposed project.[2] Pursuant to NEPA, this joint EIR/EIS evaluates the following alternatives at an equal level of detail:

- CEQA Proposed Project (NEPA Build Alternative 1)
- CEQA Reduced Density Alternative (NEPA Build Alternative 2)
- NEPA No-Action Alternative

The Project Proponent has also identified one variant/sub-alternative that includes certain project features that are different from those of the CEQA Proposed Project and CEQA Reduced Density Alternative (as further discussed in Section 2.4, *Description of the No Student/Faculty Housing Variant/Sub-Alternative,* in Chapter 2, *Proposed Project/Proposed Action and Alternatives,* of this joint

[1] Throughout this joint environmental impact report/environmental impact statement (EIR/EIS), *proposed project* refers to both the proposed project (under the California Environmental Quality Act) and the proposed action (under the National Environmental Policy Act).

[2] Throughout this joint EIR/EIS, the discussion of the CEQA Proposed Project and each CEQA alternative (other than the CEQA No Project/Existing Conditions Alternative) also applies to the corresponding Build Alternative under NEPA.

EIR/EIS). In addition, the CEQA Proposed Project could also include a Water Reuse Facility (WRF) Option or a Central Utility Plant (CUP) Option; the CEQA Reduced Alternative would not include a WRF Option or a CUP Option.[3]

Consistent with the guidance in State CEQA Guidelines 15126.6(d) and 15126.6(e), the following alternatives are evaluated in comparison the CEQA Proposed Project in Chapter 5, *Other CEQA Information and Alternatives*:

- CEQA No-Project/Existing Conditions Alternative
- CEQA Reduced Height Alternative[4]

The CEQA Proposed Project (with or without the WRF Option, CUP Option, and water and recycled water main connection options discussed in Section 2.3.6, *Utilities*, and with or without the variant/sub-alternative discussed in Section 2.4, *Description of the No Student/Faculty Housing Variant/Sub-Alternative,* in Chapter 2) or the CEQA Reduced Density Alternative (with or without the water and recycled water main connection options discussed in Section 2.3.6 and with or without the variant/sub-alternative discussed in Section 2.4 in Chapter 2) could reasonably be approved by NASA. The final decision as to whether to adopt the CEQA Proposed Project or the CEQA Reduced Density Alternative will be made after completion of the final joint EIR/EIS.

A full description of the proposed project/proposed action is provided in Chapter 2, *Proposed Project/Proposed Action and Alternatives,* of this joint EIR/EIS.

1.1 CEQA and NEPA Lead Agencies

NASA is the NEPA Lead Agency for the proposed action. As the Authority Having Jurisdiction, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. The UC Regents is the CEQA Lead Agency for the proposed project and would provide authorization before the proposed action is submitted for NASA's approval.[5]

[3] Under the WRF Option, portions of the non-potable supply would be provided on-site rather than by Mountain View. The CUP Option would provide a centralized heating and cooling system for all buildings instead of building-by-building heating, ventilation, and air-conditioning (HVAC) systems.

[4] CEQA Guidelines require that an EIR "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives" (CEQA Guidelines Section 15126.6[a]). Thus, Chapter 5, *Other CEQA Information and Alternatives*, includes an evaluation of alternatives that could reduce or avoid significant environmental effects of the CEQA Proposed Project, including the CEQA Reduced Height Alternative.

[5] UC Regents is a legal entity that includes all of the University of California campuses.

1.2 Purpose and Intended Use of this Joint EIR/EIS

1.2.1 Purpose of the EIR

This Draft EIR for the proposed project has been prepared by UC Berkeley (on behalf of UC Regents, the CEQA Lead Agency) in conformance with the provisions of the CEQA statute (California Public Resources Code Section 21000 et seq.) and CEQA Guidelines (California Code of Regulations Title 14, Section 15000 et seq.). As stated above, the lead agency is the public agency with principal responsibility for carrying out or approving a project under CEQA.

This EIR assesses potentially significant impacts that could result from the proposed project. As defined in CEQA Guidelines Section 15382, a significant effect on the environment is:

> …a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

In accordance with CEQA Guidelines Section 15143, an EIR analyzes the significant effects on the environment that could result from construction and operation of a project. CEQA Guidelines Section 15131 specifies that "…the intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus of the analysis shall be on the physical changes." Therefore, this Draft EIR does not treat economic or social effects of the proposed project as significant effects on the environment, unless they result in physical changes to the environment. In addition, if it is determined that a potential impact is too speculative for evaluation, this condition is noted, and further discussion of the impact is not necessary.

As stated in the CEQA Guidelines, an EIR is an informational document. It is intended to inform public agency decision makers and the public of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to a project. The purpose of this Draft EIR is to provide UC Berkeley, responsible and trustee agencies, other public agencies, and the public with detailed information about the environmental effects that could result from the proposed project; examine and set forth feasible methods of mitigating any adverse environmental impacts should the proposed project be approved; and consider feasible alternatives to the proposed project. UC Berkeley will use this EIR, along with other information in the public record, to determine whether to approve, modify, or deny the proposed project and specify any applicable environmental conditions or mitigation measures as part of the proposed project approvals.

As stated above, the Project Proponent will require the UC Regents' authorization to proceed with the proposed project under CEQA. The UC Regents will consider the information in this joint EIR/EIS. Figure 1-1 provides an overview comparison of the CEQA and NEPA processes for an EIR and EIS, respectively.

1.2.2 Purpose of the EIS

The primary purpose of an EIS is to ensure that federal agencies consider the environmental impacts of their actions and inform decision-makers and the public of reasonably foreseeable environmental effects and a reasonable range of project alternatives in accordance with NEPA. An EIS provides information regarding the purpose and need for the proposed action, describes the affected environment, and discusses significant effects and reasonable alternatives that are technically and economically feasible and meet the purpose and need of the proposed action. This EIS has been prepared in accordance with NEPA, as amended (42 United States Code Section 4321 et seq). Additionally, NEPA requires the integration of its requirements with other planning and environmental review procedures required by law or by agency practices (such as CEQA) so that such procedures run concurrently rather than consecutively. Therefore, a joint EIR/EIS has been prepared for the proposed action. Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS serves as the EIS for the proposed project.

As stated above, the Project Proponent will require NASA's approval to proceed following analysis required in NEPA. NASA will consider the information in this joint EIR/EIS. Figure 1-1 provides an overview comparison of the CEQA and NEPA processes for an EIR and EIS, respectively.

1.2.3 Intended Uses of this Joint EIR/EIS

The purpose of this joint EIR/EIS is to assess and disclose the potential environmental impacts associated with adoption and implementation of the proposed project and to determine corresponding mitigation measures as necessary. The proposed project is evaluated at a detailed project level in this joint EIR/EIS and is intended to be relied upon by UC Berkeley and NASA to provide CEQA and NEPA clearance, respectively, for approval and entitlement of the proposed project. This joint EIR/EIS is also intended to provide CEQA and NEPA clearance for review, approvals, or actions by other agencies or entities, as listed in Section 2.3.8, *Reviews and Approvals by Lead Agencies, Responsible Agencies, and Other Agencies,* in Chapter 2.

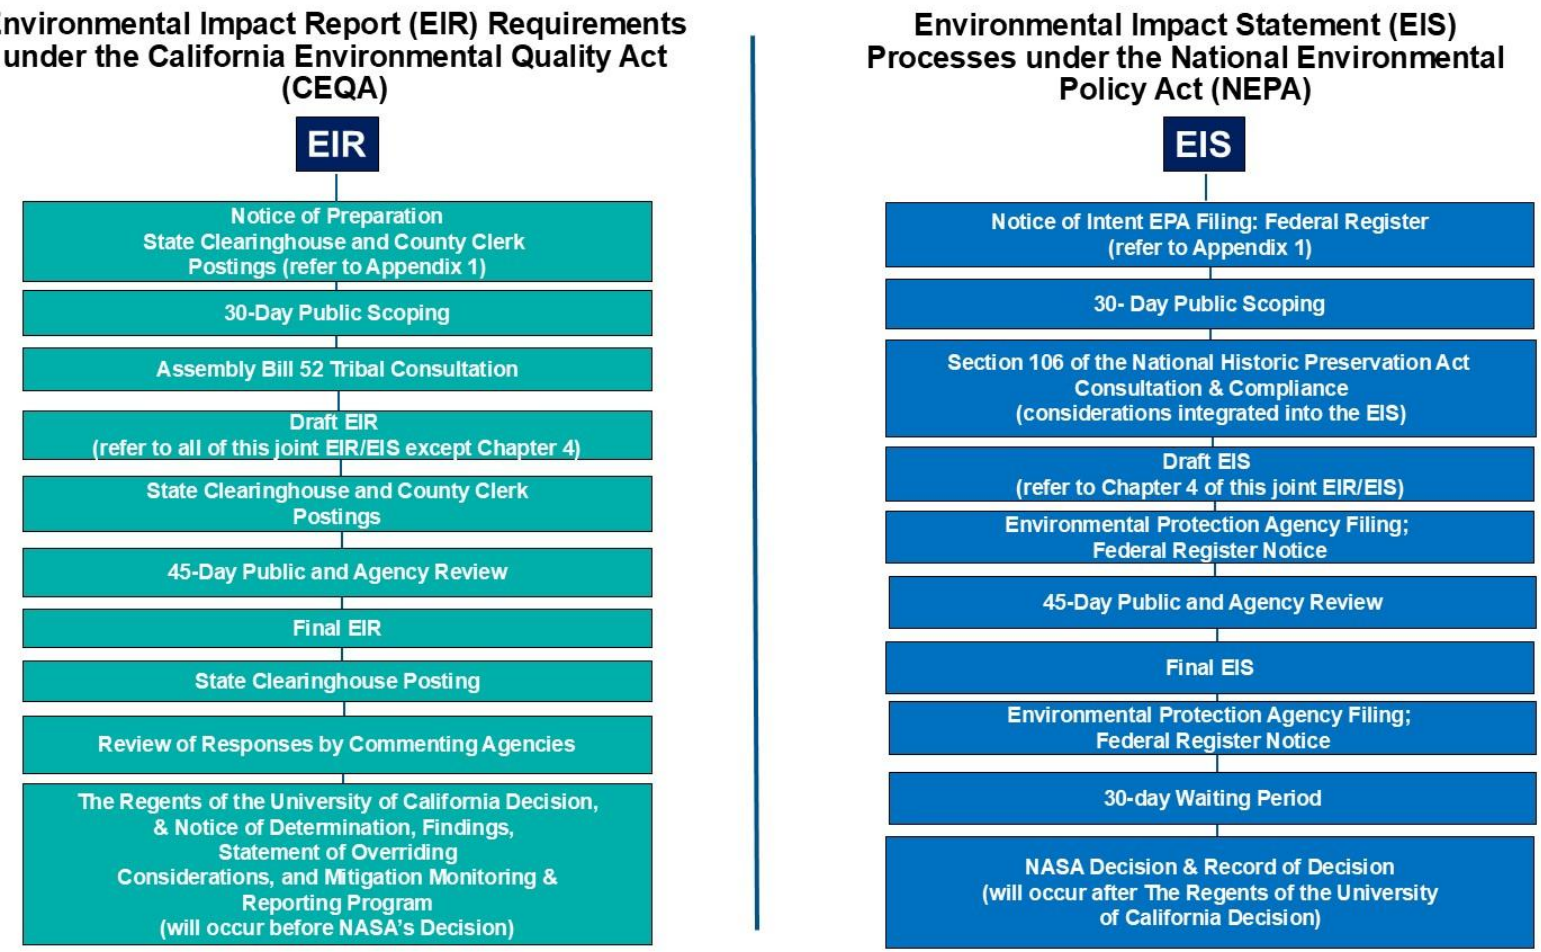

Figure 1-1. CEQA and NEPA Processes

1.3 Public and Agency Involvement during the Environmental Review Process

NASA and UC Berkeley have taken steps to provide opportunities for participation in the environmental review process in accordance with NEPA and CEQA Guidelines. During preparation of this joint EIR/EIS, an effort was made to engage the public; stakeholders; Native American tribes; federal, state, and local agencies; and other interested parties in the environmental review process to help define the range of potential alternatives to be evaluated, methodologies for analysis, probable environmental effects, and possible mitigation measures to be considered in the environmental document.

Efforts to engage the public and agencies throughout the CEQA and NEPA processes are described in the sections below. Figure 1-1 provides an overview comparison of the CEQA and NEPA processes for an EIR and EIS, respectively.

1.3.1 California Environmental Quality Act Process

1.3.1.1 Notice of Preparation and Scoping

The term *scoping* refers to the process used to assist the lead agency in determining the focus and content of an EIR. Scoping solicits input on the potential topics to be addressed in an EIR, the range of project alternatives, and possible mitigation measures. Scoping is also helpful in establishing methods of assessment and selecting the environmental effects to be considered. In compliance with CEQA Section 21080.4, the scoping process for the EIR was initiated when the notice of preparation (NOP) was released for the proposed project on June 21, 2024, for a 30-day public review period through July 22, 2024. Public scoping meetings were held via Zoom on July 10, 2024, and July 15, 2024. The NOP noted that the proposed project may have a significant effect on the environment and that an EIR would be prepared for the proposed project. Appendix 1-1 of this joint EIR/EIS includes the scoping report, which provides a copy of the NOP.

The NOP was sent to individuals, local interest groups, adjacent property owners, and responsible and trustee state and local agencies that have jurisdiction over or interest in environmental resources or conditions in the vicinity of the Project Site. The purpose of the NOP was to allow various private and public entities to transmit their concerns and comments on the scope and content of this EIR, focusing on specific information related to each individual's or group's interest or agency's statutory responsibility early in the environmental review process.

In total, seven comment letters were received from public agencies, local organizations, and individuals. Four comment letters were received from agencies (Native American Heritage Commission, California Department of Toxic Substances Control, County of Santa Clara, California Department of Fish and Wildlife), one Tribe (Confederated Villages of Lisjan Nation), and two organizations (Carpenters Union—Local 405 and American Federation of State, County, and Municipal Employees—Local 3299). In addition, members of the public made comments at the scoping meetings. All of these comments were considered during the preparation of this EIR/EIS. Appendix 1-1 of this joint EIR/EIS includes the scoping report, which provides copies of the NOP comment letters.

The NOP concluded that the following environmental resource areas would be addressed as separate sections in this joint EIR/EIS:

- Aesthetics and Visual Resources[6]
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology, Soils, and Paleontological Resources
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation
- Tribal Cultural Resources
- Utility and Service Systems

The proposed project would not result in impacts on agricultural and forestry resources or mineral resources because none of these resources exist at the Project Site; there would also be no impacts related to wildfire. A detailed analysis of these topics is therefore not included in this Draft EIR/EIS; however, these topics are briefly discussed in Section 3.19, *Effects Not Found to be Significant*.

1.3.1.2 CEQA Public Review of the Joint Draft EIR/EIS

This joint EIR/EIS is considered a draft under CEQA because it must be reviewed and commented upon by public agencies, organizations, and individuals before being finalized. This document is being distributed for a 45-day (minimum) public review and comment period. Readers are invited to submit written comments on the document. Hard copies of the joint Draft EIR/EIS are available for review at Mountain View Public Library at 585 Franklin Street, Mountain View, CA 94041, and Sunnyvale Public Library at 665 West Olive Avenue, Sunnyvale, CA 94086. Electronic copies of this joint Draft EIR/EIS are available for review online on UC Berkeley's Capital Strategies website: https://capitalstrategies.berkeley.edu/environmental-review.

The 45-day public review period for the joint Draft EIR/EIS is from **April 24, 2026,** to **June 10, 2026**. Written comments should be submitted during this review period to:

By email:
planning@berkeley.edu

By mail:
Shraddha Navalli Patil, Ph.D., Senior Planner
Physical & Environmental Planning
University of California, Berkeley
1995 University Avenue, Room 530
Berkeley, CA 94704

[6] As discussed in Section 3.2, *Aesthetics and Visual Resources*, this joint EIR/EIS does not consider aesthetics in determining the significance of impacts under CEQA, pursuant to Public Resources Code Section 21099. However, a discussion of the proposed project's potential impacts related to aesthetics is included for informational purposes and for consistency with the aesthetics and visual resources analysis required under NEPA and the EIS portion of this joint EIR/EIS.

Email correspondence is preferred. To receive comments on the joint Draft EIR/EIS, one joint public hearing will be held by UC Berkeley and NASA on May 13, 2026**.** Hearing notices will be mailed to responsible agencies and interested individuals.

1.3.1.3 CEQA Final EIR/EIS and Consideration of Project Approval

Following the close of the 45-day public review period, UC Berkeley will prepare responses to all substantive comments related to potential physical changes to the environment. The joint Draft EIR/EIS, along with the written and oral substantive comments received during the review period, as well as responses to those comments, will make up the joint Final EIR/EIS. All responses to comments submitted on the joint Draft EIR/EIS by public agencies will be provided to those agencies at least 10 days before certification of the joint EIR/EIS.

The joint Final EIR/EIS (consisting of the joint Draft EIR/EIS and the responses to comments) will be considered by the UC Regents to certify the joint Final EIR/EIS and then approve or deny the proposed project application. NASA is the final decision-making body regarding the project-specific discretionary development entitlements. The proposed project would also involve permits that are anticipated to be required for the proposed project from other city and responsible or other agencies as detailed in Chapter 2, *Proposed Project/Proposed Action and Alternatives*.

Additionally, when a public agency approves a project evaluated under CEQA in the form of an EIR, CEQA requires that the public agency adopt a Mitigation Monitoring and Reporting Program (MMRP) to ensure that the mitigation measures identified in the EIR are implemented. The MMRP will include details on the mitigation and assigns responsibility for their implementation and will be considered by the UC Regents in conjunction with the joint Final EIR/EIS.

Certification of the joint Final EIR/EIS by the UC Regents as complete and adequate, in conformance with CEQA, does not grant any land use approvals or entitlements for the proposed project. The merits of the proposed project will be considered by the UC Regents following certification of the joint Final EIR/EIS. The CEQA Guidelines require that, for one or more significant and unavoidable impacts that cannot be substantially mitigated, a lead agency must prepare a Statement of Overriding Considerations that balances the social, economic, technological, and legal benefits of approving a project against the significant and unavoidable environmental impacts that would result from project implementation. If significant and unavoidable impacts are identified, the UC Regents will consider the Statement of Overriding Considerations for the proposed project.

1.3.2 National Environmental Policy Act Process

1.3.2.1 Notice of Intent Scoping

The scoping process for the EIS was initiated when the notice of intent (NOI) was released for the proposed action on June 25, 2024 for a 30-day public review period through July 26, 2024. Public scoping meetings were held via Zoom on July 10, 2024, and July 15, 2024. In addition, the NOI was published in the *Federal Register* on June 26, 2024, under Docket Number NASA-24-039. Appendix 1-1 of this joint EIR/EIS includes the scoping report, which provides a copy of the NOI. The NOI was sent to individuals, local interest groups, cooperating agencies, and state and local agencies that have jurisdiction over or interest in environmental resources or conditions in the vicinity of the Project Site. Scoping allowed various private and public entities to transmit their concerns and

comments on the scope and content of this EIS, identify significant issues, and provide input on alternatives.

In total, four comment letters were received from public agencies, local organizations, and individuals. Comment letters were received from two agencies (City of Sunnyvale, U.S. Environmental Protection Agency Region 9), one individual, and one organization (American Federation of State, County, and Municipal Employees—Local 3299). In addition, members of the public made comments at the scoping meetings. All of these comments were considered during the preparation of this joint EIR/EIS. Appendix 1-1 of this joint EIR/EIS includes the scoping report, which provides copies of the NOI comment letters.

1.3.2.2 NEPA Public Review of the Joint Draft EIR/EIS

NASA provided public notice of availability of the joint Draft EIR/EIS to interested individuals, agencies, and organizations to review and comment on the document prior to being finalized. This document is being distributed for a 45-day public review and comment period. Readers are invited to submit written comments on the document. Hard copies of the joint Draft EIR/EIS are available for review at Mountain View Public Library at 585 Franklin Street, Mountain View, CA 94041, and Sunnyvale Public Library at 665 West Olive Avenue, Sunnyvale, CA 94086. Electronic copies of the joint Draft EIR/EIS are available for review online at https://environment.arc.nasa.gov/NEPA.html. Additionally, the document will be made available through the *Federal Register.*

The 45-day public review period for the joint Draft EIR/EIS is from **April 24, 2026,** to **June 10, 2026**. Written comments should be submitted during this review period to:

By email:
arc-nepacomments@mail.nasa.gov

By mail:
Andres Estrada
Acting Deputy Division Chief
Center NEPA Program Manager| Natural Resources Manager
NASA Ames Research Center
M/S 213-7
Moffett Field, CA 94035-0001

To receive comments on the joint Draft EIR/EIS, one joint public hearing will be held by UC Berkeley and NASA on May 13, 2026**.** Hearing notices will be mailed to responsible agencies and interested individuals.

1.3.2.3 NEPA Final EIR/EIS and Consideration of Project Approval

Following the close of the 45-day public review period, NASA will prepare responses to all substantive comments related to potential physical changes to the environment. The joint Final EIR/EIS will consist of the (1) the joint Draft EIR/EIS, (2) a list of individuals, organizations, or agencies that provided comments on the joint Draft EIR/EIS, (3) comments received on the joint Draft EIR/EIS during the public comment period, (4) responses to the comments provided on the joint Draft EIR/EIS, and (5) and other clarification of errors, omissions, or misinterpretation of the discussion in the findings in the joint Draft EIR/EIS by NASA. The joint Final EIR/EIS will be published on NASA's project website and accessible to the public.

After the Final EIS is published, NASA will prepare a written record explaining why NASA has chosen to undertake a proposed action, identifying what the proposed action is, and any mitigation identified in the EIR/EIS that NASA is requiring. The MMRP details the mitigation and assigns responsibility for their implementation; the final MMRP will also be prepared by NASA.

The National Historic Preservation Act (NHPA) mandates that federal agencies consider the effects of projects on historic properties and seek comments on their actions from an independent reviewing agency, the State Historic Preservation Office (SHPO) and/or the Advisory Council on Historic Preservation (ACHP). Title 36 of the Code of Federal Regulations provides the methodology for assessing impacts on historic properties and details the requirements of the consultation process. For complex projects and programs expected to continue over time, the Section 106 regulations allow development of a Programmatic Agreement (PA) that governs ongoing and future activities undertaken as part of the project or program it addresses. An agency may fulfill its obligations under Section 106 by following the alternate review process outlined in a PA. NASA, in consultation with the Advisory Council on Historic Preservation, the National Conference of State Historic Preservation Officers, and other consulting parties, developed the NASA-Wide Programmatic Agreement (NPA) as a Section 106 program alternative pursuant to 36 CFR 800.14(b). Executed in October 2025, the NPA governs NASA's implementation of alternate procedures for project review and the resolution of adverse effects on historic properties under Section 106. Historic properties and impacts to them are analyzed in Section 4.5.5, *Cultural Resources*, in Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS. NASA will use the process described in the NPA to satisfy its obligations under Section 106.

1.3.3 Cooperating Agencies

A cooperating agency is an agency with jurisdiction by law and/or with special expertise related to a proposed federal action. A participating agency under NEPA is a federal, state, tribal, or local agency participating in an environmental review or authorization of a proposed action. Cooperating agencies are also considered participating agencies.

NASA worked closely with a number of other federal, state, and local agencies throughout this NEPA process. During the public scoping period, NASA invited several state and local agencies with special expertise and potential jurisdiction over the proposed project to participate in the NEPA process. Of the notified agencies, the California Department of Transportation (Caltrans), the City of Mountain View, and the Santa Clara Valley Transportation Authority (VTA) agreed to be cooperating agencies and are considered as such under NEPA.

1.3.4 Responsible Agencies

Under CEQA, a responsible agency is a public agency which proposes to carry out or approve a project, for which a lead agency is preparing or has prepared an EIR. A responsible agency includes all public agencies other than the lead agency which have discretionary approval power over a project. Responsible agencies include the Bay Area Air District, San Francisco Bay Regional Water Quality Control Board, U.S. Army Corps of Engineers, Army, U.S. Fish and Wildlife Service, State Historic Preservation Officer, State Water Resources Control Board Division of Drinking Water, U.S. Environmental Protection Agency, City of Mountain View, City of Sunnyvale, Santa Clara Valley Transportation Authority (VTA), and California Department of Transportation.

1.3.5 Trustee Agencies

A trustee agency under CEQA is a public agency having jurisdiction by law over natural resources affected by a project which are held in trust for the people of the State of California. There are no trustee agencies for the proposed project.

1.4 Project Location

The proposed project would be located at NASA ARC on an approximately 39-acre project site (Project Site), along with approximately 6 acres of off-site areas (Off-Site Areas) where utility improvements and building demolition would take place, as discussed in Section 2.3.7, *Off-Site Utility Improvements and Demolition*. Together, the Project Site and Off-Site Areas comprise the approximate 45-acre limits of work (Limits of Work) and are more fully described below.[7]

The Limits of Work are located primarily on federal land within NASA ARC, an approximately 2,000-acre facility in unincorporated Santa Clara County, California, between U.S. 101 and the southwest edge of San Francisco Bay. A small portion of the Off-Site Areas is on federal land owned by the United States Army (Army). The city of Mountain View borders NASA ARC to the north and southwest, and the city of Sunnyvale borders NASA ARC to the southeast and east. NASA ARC is approximately 33 miles south of the city of San Francisco and 8 miles north of the city of San José.

The Project Site is within the city of Mountain View Sphere of Influence but outside of any city's jurisdictional limits. The Off-Site Areas are also within the city of Mountain View Sphere of Influence; most of the Off-Site Areas are outside of any city's jurisdictional limits, with the exception of the northern portion and the southwestern portion, which are within the city of Mountain View. The Project Site is bounded by Wescoat Road to the north and Cody Road to the east.[8] The western boundary of the Project Site is within an empty lot immediately west of Bailey Road. The Project Site is a portion of Assessor's Parcel Number 116-18-012.

Regional access to the Project Site is provided by U.S. 101, approximately 0.2 mile to the south; State Route (SR) 85, approximately 0.7 mile to the southwest; and SR 237, approximately 1.0 mile southeast. In addition, the Bayshore/NASA Santa Clara Valley Transportation Authority (VTA) light rail station is located off Manila Avenue just southeast of the Project Site, between Macon Road and U.S. 101, providing daily service between Mountain View and Alum Rock, with connections to Altamont Corridor Express (ACE) and Capitol Corridor trains, Milpitas the Bay Area Rapid Transit (BART) station, and the Mountain View Caltrain station. The majority of the Project Site is within 0.5 mile of the Bayshore/NASA VTA light rail station and also close to the VTA bus stops on North Akron Road and South Akron Road.

[7] Wescoat Village is not part of the Limits of Work; rather, the Limits of Work follow the roadways surrounding Wescoat Village, as shown in Figure 2-2.

[8] Cody Road would be realigned to the east as part of the proposed project and would be the eastern boundary of the Project Site.

1.5 Selection of Alternatives

Pursuant to NEPA, this joint EIR/EIS evaluates the following alternatives at an equal level of detail:

- **CEQA Proposed Project (NEPA Build Alternative 1)**, which would create approximately 2.3 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. The CEQA Proposed Project would include approximately 2 million square feet for Research and Office Uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 130,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging. Only the CEQA Proposed Project includes the Water Reuse Facility (WRF) Option and the Central Utility Plant (CUP) Option.[9]
- **CEQA Reduced Density Alternative (NEPA Build Alternative 2)**, which would create approximately 1.4 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. Compared to the CEQA Proposed Project, the CEQA Reduced Density Alternative would provide less space for Research and Office Uses. The CEQA Reduced Density Alternative would include approximately 1.1 million square feet for Research and Office Uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 130,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging. Table 2-2 summarizes the similarities and differences between the CEQA Proposed Project and the CEQA Reduced Density Build Alternative.
- **NEPA No-Action Alternative**, under which the proposed action would not be constructed and operated at the Project Site. The buildings within the Limits of Work that are currently operational would continue to be operational. The buildings within the Limits of Work that are currently vacant would be reoccupied consistent with the prior uses of the buildings (e.g., ancillary buildings that supported Navy operations as well as industrial, storage, and utility facilities); reoccupying the vacant buildings would not require construction activity. The NADP, which established NASA's vision for long-term development of NASA ARC, also allows other types of uses at the Project Site. The NEPA No-Action Alternative could result in retaining the approximately 185,600 square feet of existing mixed uses, resulting in approximately 668 employees.[10] The NEPA No-Action Alternative would not result in the reoccupation of any buildings formerly used for lodging; thus, the NEPA No-Action Alternative would not generate any new full-time residents or short term occupants (e.g., summer interns) within the Limits of Work.

The Project Proponent has identified one variant/sub-alternative that includes certain project features that are different from those of the CEQA Proposed Project and CEQA Reduced Density Alternative: the No Student/Faculty Housing Variant/Sub-Alternative (Variant).[11] Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. Specifically, the Variant would include 90,000 square feet of laboratory and

[9] Under the Water Reuse Facility Option, portions of the non-potable supply would be provided on-site rather than by Mountain View. The Central Utility Plant Option would provide a centralized heating and cooling system for all buildings instead of building-by-building heating, ventilation, and air-conditioning (HVAC) systems.

[10] This is based on a generation rate of 3.6 employees per 1,000 square feet.

[11] Throughout this joint EIR/EIS, *Variant* refers to both the Variant (under CEQA) and the Sub-Alternative (under NEPA).

R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses. The Variant would have the same type of land uses; the same general site plan; the same maximum building height; the same amount of Conference Uses, Active Uses, Short-Term Lodging, and open space; the same number of guests; the same roadway infrastructure; the same utility infrastructure; the same parking ratio; and the same construction activities proposed and evaluated under the CEQA Proposed Project and CEQA Reduced Density Alternative, unless otherwise noted below. Because the amount of Research and Office Uses and the number of Student/Faculty Housing units would be different under the Variant, the number of bicycle parking spaces, and the number of residents, employees, and students would likewise change.

The differences among the CEQA Proposed Project, the CEQA Proposed Project with the Variant, the CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant are analyzed quantitatively throughout this joint EIR/EIS, as applicable.

As discussed above, consistent with the guidance in State CEQA Guidelines Sections 15126.6(d) and 15126.6(e), the following alternatives are evaluated in comparison to the CEQA Proposed Project with or without the variant/sub-alternative discussed in Chapter 5, *Other CEQA Information and Alternatives*:

- **CEQA Reduced Height Alternative,** which would create approximately 2 million square feet of Research and Office Uses, Conference Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. Compared to the CEQA Proposed Project, the CEQA Reduced Height Alternative would achieve lower maximum building height in some areas. In addition, the CEQA Reduced Height Alternative would provide less space for Research and Office Uses and less space for Student/Faculty Housing compared to the CEQA Proposed Project. The CEQA Reduced Height Alternative would include approximately 1.66 million square feet for Research and Office Uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 100,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging.
- **CEQA No-Project/Existing Conditions Alternative**, under which the Project Proponent would not construct and operate the proposed project at the Project Site. The buildings within the Limits of Work that are currently operational would continue to be operational, and the buildings within the Limits of Work that are currently vacant would remain vacant.[12]

1.6 Thresholds of Significance

This joint EIR/EIS analyzes significant effects that could result from the proposed project. The impact significance thresholds for each environmental resource area evaluated under CEQA in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, are based on CEQA Guidelines Appendix G, *Environmental Checklist Form* (supplemented or revised as appropriate to fit the proposed project). NEPA does not have a single set of standards against which proposed actions can be evaluated. Therefore, criteria for evaluating the significance of impacts for all sections under NEPA in Chapter 4, *Environmental Impact Statement*, were largely based on CEQA Guidelines Appendix G, as well as professional standards

[12] This provides a conservative analysis under CEQA for the purposes of comparison.

1.7 CEQA Project Objectives

Section 15124(b) of the CEQA Guidelines requires a project to contain a clear statement of project objectives, including the underlying purpose of the project. The underlying purpose of the proposed project is to redevelop the approximately 39-acre Project Site with an economically viable development that combines housing, lodging, conference center, and academic uses, and employment opportunities near transit and freeway access. Project objectives include the following:

1. Develop a state-of-the-art, collaborative, and multidisciplinary master-planned research park that integrates public and private R&D efforts in the areas of space exploration, scientific discovery, and aeronautics, as contemplated in the NASA Ames Development Plan (NADP).
2. Co-locate University of California, Berkeley (UC Berkeley) academic and private industry research space at NASA Ames Research Center (NASA ARC) to enable intellectual exchange, interdisciplinary research and experimentation, and further advancements in science, engineering, and technology among government, private industry, and academia.
3. Provide sufficient multi-tenant Class A office, R&D, academic space, and a conference center to support a variety of research functions and tenant types and sizes to create a synergistic campus environment while maintaining flexibility to be responsive to academic needs, tenant demands, and market conditions.
4. Provide a publicly accessible and high-quality central greenspace to provide a space for collaboration and informal meeting spaces for faculty, staff, employees, and visitors of the Berkeley Space Center while also providing ecological functions such as stormwater management and phytoremediation.
5. Redevelop an underutilized site by replacing existing obsolete and aging buildings and infrastructure with new state-of-the-art buildings and infrastructure in a manner that optimizes density and site capacity while complying with applicable environmental and land use restrictions.
6. Create a financially sustainable R&D campus that can support costs associated with the completion of the critical infrastructure upgrades and improvements necessary to redevelop the site and facility operations.
7. Provide a positive fiscal impact on the local economy and NASA ARC through the creation of public, private, and non-profit industry jobs.

1.8 NEPA Purpose and Need

The purpose of the proposed project is to:

- Facilitate the development and long-term operation of a collaborative research environment at NASA ARC as contemplated in the NADP.
- Create a research development that combines UC Berkeley's mission to accelerate scientific discovery, create innovative technologies, and advance knowledge for the benefit of humanity with NASA's mission to enable exploration, innovative technologies, and interdisciplinary scientific discovery through the integration of public and private research and development efforts.

- Strengthen and expand NASA ARC's global profile, attracting and retaining new research talent as well as generating innovative ideas for use throughout the world and the cosmos.
- Promote collaborative research and development activities among NASA ARC, UC Berkeley, private industry, and non-profit organizations.
- Provide lodging options or on-site short-term housing, or both, to primarily support faculty, students, and visitors.
- Enable more efficient use of land at NASA ARC by demolishing older underutilized buildings and infrastructure and constructing new facilities and associated infrastructure involved in the creation of the new research space.

The need for the proposed project is as follows:

- To maintain NASA's position at the forefront of technological innovation and as a catalyst for space and aeronautical research and technology transfer.
- To strengthen the United States' ability to address the research challenges of tomorrow by combining NASA's unique ability to focus on high-risk long-term research; the industry's ability to react quickly with applied technology; and UC Berkeley's expertise in educating and providing a vibrant workforce for the future.

1.9 Organization of Document

This joint EIR/EIS is organized into the following chapters:

- *Executive Summary* provides a summary of the proposed project/proposed action and the alternatives, the impacts that would result from its implementation, and mitigation measures recommended to reduce, eliminate, or avoid significant impacts. The Executive Summary also describes the Variant.
- Chapter 1, *Introduction and Organization of Document*, discusses the purpose of the joint EIR/EIS, provides a summary of the proposed project/proposed action, alternatives, Variant, CEQA and NEPA processes, and summarizes the scope and organization of the joint EIR/EIS.
- Chapter 2, *Proposed Project/Proposed Action and Alternatives*, describes the Project Site location and setting, the CEQA Proposed Project and the CEQA Reduced Density Alternative, the Variant, and the required approvals process.
- Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, describes the existing conditions (i.e., affected environment/setting), and applicable regulations adopted by local jurisdictions and other agencies for each environmental topic.

  The chapter also describes the following for each environmental topic in accordance with CEQA requirements: potential environmental impacts of the proposed project/proposed action and their level of significance, and mitigation measures recommended to reduce or avoid identified potential impacts. The EIR evaluates the following alternatives in Chapter 3: CEQA Proposed Project and the CEQA Reduced Density Alternative. Chapter 3 also evaluates the potential environmental impacts of the CEQA Proposed Project with the Variant and the CEQA Reduced Density Alternative, their level of significance, as well as recommends mitigation measures to reduce or avoid identified potential impacts. Additionally, potential cumulative impacts are also addressed in each resource section. Potential adverse impacts are identified by level of

significance, as follows: no impact, less than significant, significant, less than significant with mitigation, and significant and unavoidable. The significance of each potential impact is categorized before and after any recommended mitigation measure(s). If uncertain, impacts that might be significant are characterized as potentially significant.

- Chapter 4, *Environmental Impact Statement*, describes the following for each environmental topic in accordance with NEPA requirements: direct and indirect impacts of the environmental resource topics specific to NEPA for each of the alternatives and Variant. This chapter also includes other required NEPA disclosures, including the relationship between short-term uses of the environment and long-term productivity associated with federal actions, irreversible and irretrievable commitment of resources and energy consumption, and potentially significant and unavoidable adverse impacts.
- Chapter 5, *Other CEQA Information and Alternatives*, provides discussions required by CEQA, including a list of the proposed project's significant and unavoidable environmental impacts, significant irreversible environmental changes, and growth-inducing impacts. Chapter 5 also evaluates alternatives to the proposed project, including the CEQA No-Project/Existing Conditions Alternative and CEQA Reduced Height Alternative, alternatives considered but eliminated from further consideration, and identifies the environmentally superior alternative.
- Chapter 6, *Submitted Alternatives, Information and Analyses, Scoping Comments, and Areas of Controversy*, provides a summary of alternatives, comments, and information and analyses provided by public agencies, organizations, and the public during the scoping process.
- Chapter 7, *References*, identifies the references cited through this joint EIR/EIS.
- Chapter 8, *Preparers List*, lists the entities and people who were involved or were consulted with in preparing this joint EIR/EIS.
- Chapter 9, *Descriptions of Figures*, provides descriptions of the figures presented in this joint EIR/EIS.
- Appendices contain the following reference items, which provide support and documentation of the analyses performed for this joint EIR/EIS.
    - Appendix 1-1 Scoping Report
    - Appendix 2-1 Proposed Master Plan, Development Guidelines, and Standards
    - Appendix 2-2 Environmental Issues Management Plan
    - Appendix 2-3 Temporary Traffic Control Plan Procedures
    - Appendix 2-4 Proposed Transportation Demand Management Plan
    - Appendix 3.2-1 Aesthetics and Visual Resources CEQA Evaluation
    - Appendix 3.3-1 Air Quality, Health Risk Analysis, and Greenhouse Gas Emissions Technical Report
    - Appendix 3.4-1 Biological Resources Technical Report
    - Appendix 3.4-2 Preliminary Aquatic Resources Delineation Report
    - Appendix 3.5-1 Cultural Resource Inventory Report
    - Appendix 3.7-1 Preliminary Geotechnical Evaluation

- Appendix 3.9-1 Hazardous Material Conditions
- Appendix 3.12-1 Noise and Vibration Technical Report
- Appendix 3.16-1 Transportation Analysis
- Appendix 3.18-1 Water Supply Evaluation
- Appendix 4-1 Socioeconomics Technical Report

Chapter 2

Proposed Project/Proposed Action and Alternatives

2.1 Overview of Proposed Project/Proposed Action and Alternatives

Moffett Partners, LLC (Project Proponent), a joint venture of The Regents of the University of California (UC Regents) and SKSP NRP, LLC, is proposing a master-planned mixed-use academic and research project, referred to as the Berkeley Space Center at the National Aeronautics and Space Administration (NASA) Research Park (NRP) (proposed project/proposed action).[1] The Project Proponent will require authorization from the UC Regents to proceed with the proposed project under the California Environmental Quality Act (CEQA) and NASA's approval to proceed following analysis consistent with the National Environmental Policy Act (NEPA). NASA is the NEPA Lead Agency for the proposed action and, as the Authority Having Jurisdiction, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. The UC Regents is the CEQA Lead Agency for the proposed project and would provide authorization before the proposed action is submitted for NASA's approval.[2]

The proposed project under consideration by NASA (i.e., the proposed action) would include academic and research facilities, consisting of offices, laboratories, R&D uses, and related amenities[3] (collectively, "Research and Office Uses"); conference center and related amenities[4] ("Conference Uses"); ground-floor retail, food and beverage, maker spaces (i.e., collaborative work spaces for using various tools and materials), and other complementary accessory uses that would be publicly accessible[5] (collectively, "Active Uses"); student/faculty housing, including associated amenities ("Student/Faculty Housing"); short-term lodging, including associated amenities[7] ("Short-Term Lodging"); transportation networks; and open spaces, as well as landscaped spaces, to create a state-of-the-art research and education hub that shapes the future of technology and innovation and advance the UC Regents educational, scientific research, charitable, and other exempt purposes (within the meaning of Section 501(c)(3) of the United States Internal Revenue Code). The proposed

1 Throughout this joint environmental impact report/environmental impact statement (EIR/EIS), *proposed project* refers to both the proposed project (under the California Environmental Quality Act) and the proposed action (under the National Environmental Policy Act).

2 UC Regents is a legal entity that includes all of the University of California campuses.

3 Research and Office Uses could include the following amenities: a commercial kitchen, meeting/collaboration space, training space, private open space areas, and other facilities supporting the Research and Office Uses. These amenities would support the users of the Research and Office Uses.

4 Conference Uses could include the following amenities: pre-function space, collaboration areas, meeting/event rooms, business center, gathering terraces and private open space, and other facilities supporting the Conference Uses.

5 Active Uses would be publicly accessible and could include the following types of uses and spaces: co-working space; restaurants, including on-sale alcohol, community-serving retail, personal services (including, but not limited to, dry cleaning pickup/drop-off, ATM, salons, bicycle repair); and maker space. Active Uses could occur throughout the Project Site.

6 Student/Faculty Housing could include the following amenities: fitness center, game rooms, shared entertainment space with shared kitchen, business center, leasing/administrative office space, and other facilities supporting the Student/Faculty Housing.

7 Short-Term Lodging could include the following amenities: fitness center, game rooms, shared entertainment space, business center, leasing/administrative office space, and other facilities supporting the Short-Term Lodging.

open space would include pathways, activated uses (e.g., occupied areas that pedestrians could access via sidewalks or pathways), and passive uses (e.g., open lawns, patios). The proposed project would facilitate the development and long-term operation of a collaborative research environment at the National Aeronautics and Space Administration Ames Research Center (NASA ARC) that supports NASA's position at the forefront of technological innovation and as a catalyst for space and aeronautical research.

The UC Regents will consider approving the submittal of the Project Proponent's application to NASA, an action that requires review pursuant to CEQA.[8] The Project Proponent's application proposes 2.3 million square feet[9] of mixed-use academic and research uses, which is the proposed project under CEQA (i.e., the CEQA Proposed Project).

The University of California, Berkeley (UC Berkeley) (on behalf of UC Regents) and NASA are preparing this joint environmental impact report/environmental impact statement (joint EIR/EIS) to assess potential environmental impacts that could result from the implementation of the proposed project.[10] Pursuant to NEPA, this joint EIR/EIS evaluates the following alternatives at an equal level of detail:

- CEQA Proposed Project (NEPA Build Alternative 1)
- CEQA Reduced Density Alternative (NEPA Build Alternative 2)
- NEPA No-Action Alternative

The Project Proponent has also identified one variant/sub-alternative that includes certain project features that are different from those of the CEQA Proposed Project and CEQA Reduced Density Alternative (as further discussed in Section 2.4, *Description of the No Student/Faculty Housing Variant/Sub-Alternative*). In addition, the CEQA Proposed Project could also include a Water Reuse Facility (WRF) Option or a Central Utility Plant (CUP) Option; the CEQA Reduced Alternative would not include a WRF Option or a CUP Option.[11]

[8] The application will include the proposed Berkeley Space Center Master Plan (Master Plan) provided in Appendix 2-1 of this joint EIR/EIS, which establishes the overall project vision, conceptual plans, and illustrative renderings, and the proposed Berkeley Space Center Development Guidelines (Development Guidelines) provided in Appendix 2-1 of this joint EIR/EIS, which provide strategies for the proposed buildings and landscapes within a flexible framework (as further discussed in Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*).

[9] Throughout this joint EIR/EIS, *square feet* refers to gross square feet, which is the entire square footage of a building, including maintenance and operation areas, stairwells, garages, walkways, etc.

[10] Throughout this joint EIR/EIS, the discussion of the CEQA Proposed Project and each CEQA alternative (other than the CEQA No Project/Existing Conditions Alternative) also applies to the corresponding Build Alternative under NEPA.

[11] Under the WRF Option, portions of the non-potable supply would be provided on-site rather than by Mountain View. The CUP Option would provide a centralized heating and cooling system for all buildings instead of building-by-building heating, ventilation, and air-conditioning (HVAC) systems.

Consistent with the guidance in State CEQA Guidelines Sections 15126.6(d) and 15126.6(e), the following alternatives are evaluated in comparison to the CEQA Proposed Project in Chapter 5, *Other CEQA Information and Alternatives*:

- CEQA No-Project/Existing Conditions Alternative
- CEQA Reduced Height Alternative[12]

The CEQA Proposed Project (with or without the WRF Option, CUP Option, and water and recycled water main connection options discussed in Section 2.3.6, *Utilities*, and with or without the variant/sub-alternative discussed in Section 2.4, *Description of the No Student/Faculty Housing Variant/Sub-Alternative*) or the CEQA Reduced Density Alternative (with or without the water and recycled water main connection options discussed in Section 2.3.6 and with or without the variant/sub-alternative discussed in Section 2.4) could reasonably be approved by NASA. The final decision as to whether to adopt the CEQA Proposed Project or the CEQA Reduced Density Alternative will be made after completion of the final joint EIR/EIS.

2.2 Context

In 2002, NASA prepared a programmatic EIS (PEIS) pursuant to NEPA that analyzed the environmental impact of implementation of the proposed NASA Ames Development Plan (NADP). NASA published its Record of Decision (ROD) to implement the NADP, which established NASA's vision for long-term development of NASA ARC. As part of the NADP, development was considered in four areas at NASA ARC, commonly referred to as the NRP, Eastside/Airfield, Bay View, and Ames Campus. The Project Site is within the NRP.

Since 2002, NASA (or authorized parties) has redeveloped portions of NASA ARC with entitled uses under the terms of several ground leases and other real property instruments. The Project Site is one of the parcels considered for redevelopment in the 2002 PEIS and within the scope of the analysis set forth in that document and the ROD. In 2019, NASA invited the UC Regents, on behalf of the UC system and its constituent campuses, to explore the feasibility of developing the Project Site for public and private-sector research, professional education, and housing. On November 1, 2020, the UC Regents and NASA entered into an Enhanced Use Lease for approximately 36 acres in the NRP area of NASA ARC for the purpose of facilitating development and long-term operation of a collaborative research environment on the premises, as contemplated in the PEIS, in support of various activities. In May 2021, the UC Regents authorized UC Berkeley to enter into a joint venture with SKSP NRP, LLC, to create Moffett Partners, LLC, for the proposed project. In December of 2022, the Enhanced Use Lease was assigned to an affiliate of Moffett Partners, LLC.

2.2.1 Project Location

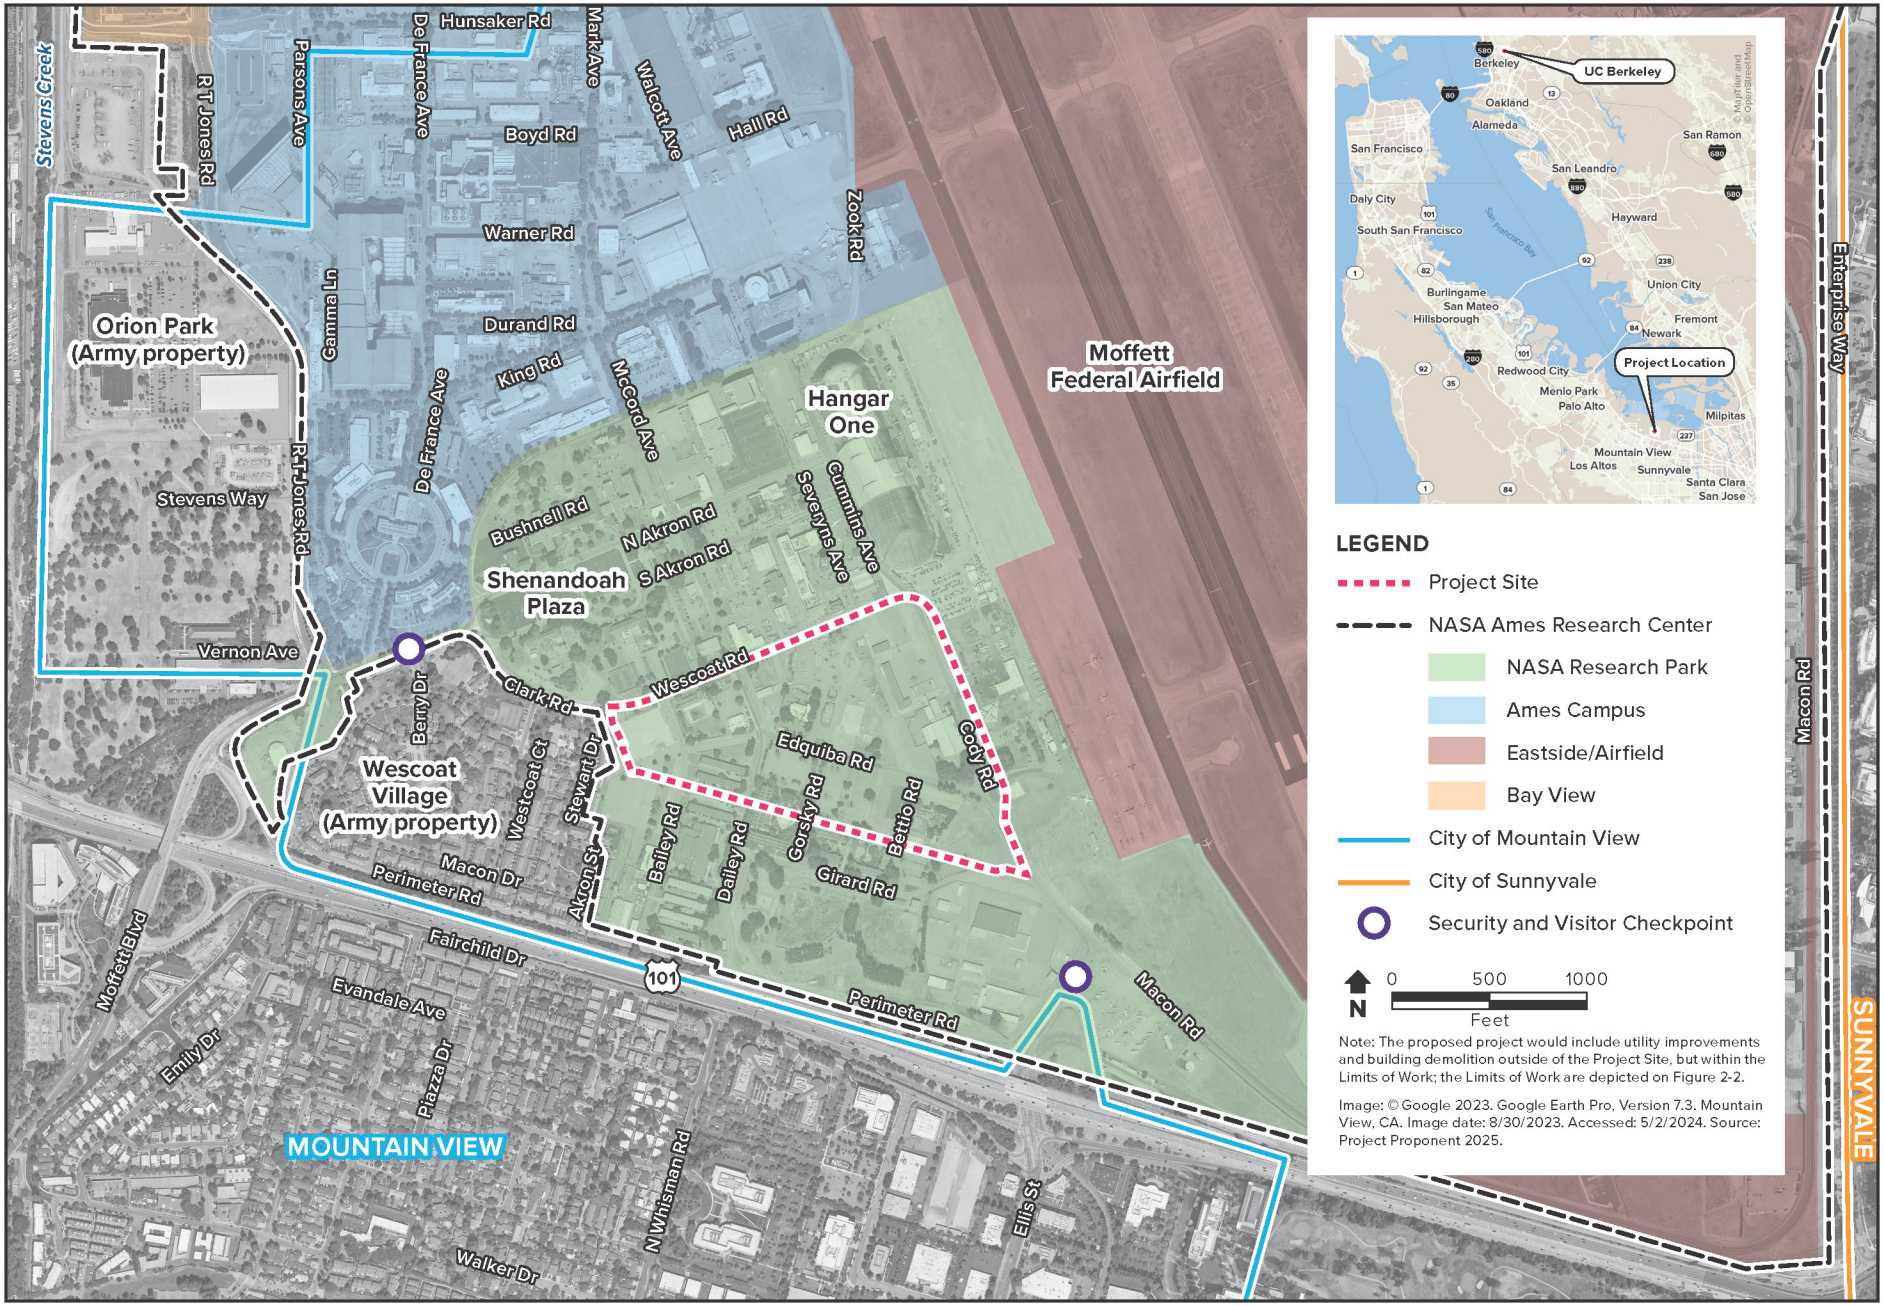
The proposed project would be located at NASA ARC, as depicted in Figure 2-1, Project Location, on an approximately 39-acre project site (Project Site), along with approximately 6 acres of off-site

[12] CEQA Guidelines require that an EIR "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives" (CEQA Guidelines Section 15126.6[a]). Thus, Chapter 5, *Other CEQA Information and Alternatives*, includes an evaluation of alternatives that could reduce or avoid significant environmental effects of the CEQA Proposed Project, including the CEQA Reduced Height Alternative.

areas (Off-Site Areas) where utility improvements and building demolition would take place, as discussed in Section 2.3.7, *Off-Site Utility Improvements and Demolition*. Together, the Project Site and Off-Site Areas comprise the approximate 45-acre limits of work (Limits of Work), as depicted in Figure 2-2, Limits of Work, and as more fully described below.[13]

The Limits of Work are located primarily on federal land within NASA ARC, an approximately 2,000-acre facility in unincorporated Santa Clara County, California, between U.S. 101 and the southwest edge of San Francisco Bay. A small portion of the Off-Site Areas is on federal land owned by the United States Army (Army). The city of Mountain View borders NASA ARC to the north and southwest, and the city of Sunnyvale borders NASA ARC to the southeast and east. NASA ARC is approximately 33 miles south of the city of San Francisco and 8 miles north of the city of San José.

The Project Site is within the City of Mountain View Sphere of Influence but outside of any city's jurisdictional limits. Most of the Off-Site Areas are also within the City of Mountain View Sphere of Influence and outside of any city's jurisdictional limits, with the exception of the northern portion and the southwestern portion, which are within the city of Mountain View. The Project Site is bounded by Wescoat Road to the north and Cody Road to the east,[14] as depicted in Figure 2-3, Existing Conditions (Project Site). The southern boundary of the Project Site is between Edquiba Road and Girard Road. The western boundary of the Project Site is within an empty lot immediately west of Bailey Road. The Project Site is a portion of Santa Clara County Assessor's Parcel Number 116-18-012.



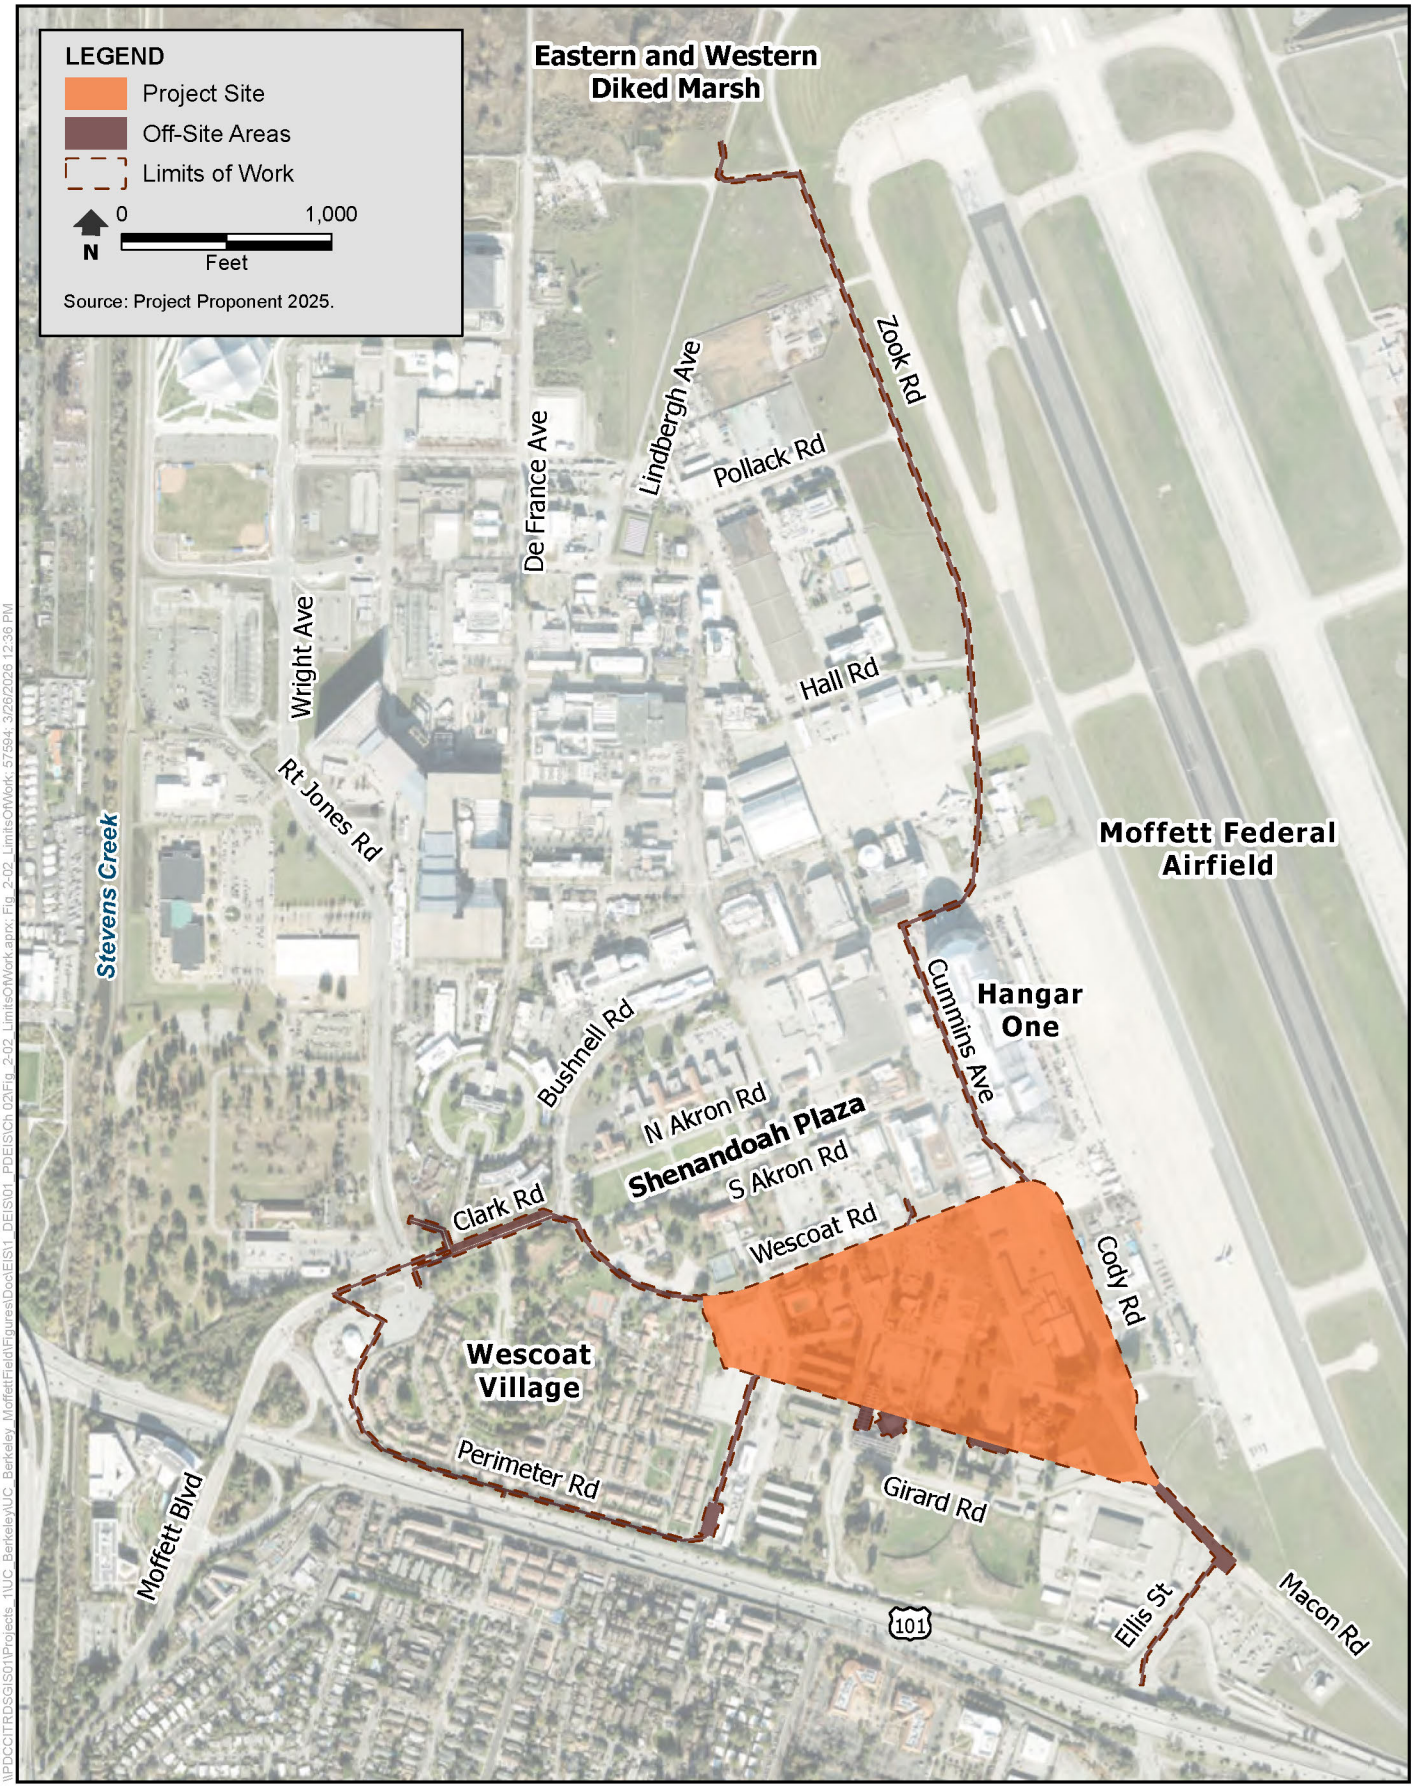
The immediate vicinity of the Project Site comprises a mix of uses. Northwest of the Project Site, across Wescoat Road, is Shenandoah Plaza, a linear open space surrounded by two-story, Mission-style buildings clustered in a formal campus-like layout defined by a west-facing gated entrance and landscape that includes mature trees, shrubs, and manicured lawns. Northeast of the Project Site, across from the intersection of Wescoat Road and Cody Road, is Hangar One, one of the largest freestanding structures in the world. Hangar One and many of the buildings, landscapes, and objects north of the Project Site are within the boundaries of the Shenandoah Plaza. East of the Project Site, across Cody Road, is Moffett Federal Airfield. An area designed as a preserve providing burrowing owl habitat is located between Moffett Federal Airfield and lands east of Cody Road; a small portion of the burrowing owl preserve overlaps the southeastern portion of the Project Site.

East of Moffett Federal Airfield is the city of Sunnyvale and large office/R&D campuses occupied by Google, Amazon, Lockheed Martin, and Meta. Beyond the southern border of the Project Site, along Girard Road in the NRP, is a recreational field and facilities previously used to support operations by the Navy; farther south is U.S. 101 and the city of Mountain View. West of the Project Site is Wescoat Village at Moffett Field, an area owned by the Army and managed by a third party that comprises multi-family and single-family residences. North the Project Site, beyond Shenandoah Plaza, is the Ames Research Center, which includes the world's largest wind tunnels, among other highly specialized R&D facilities. Farther northwest of the Project Site are additional large office/R&D Google facilities, both on NASA land and within the city of Mountain View, as well as Orion Park, a former military housing compound managed by the Army.

[13] Wescoat Village is not part of the Limits of Work; rather, the Limits of Work follow the roadways surrounding Wescoat Village, as shown in Figure 2-2.

[14] Cody Road would be realigned to the east as part of the proposed project and would be the eastern boundary of the Project Site.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*



Note: The proposed project would include utility improvements and building demolition outside of the Project Site, but within the Limits of Work; the Limits of Work are depicted on Figure 2-2.

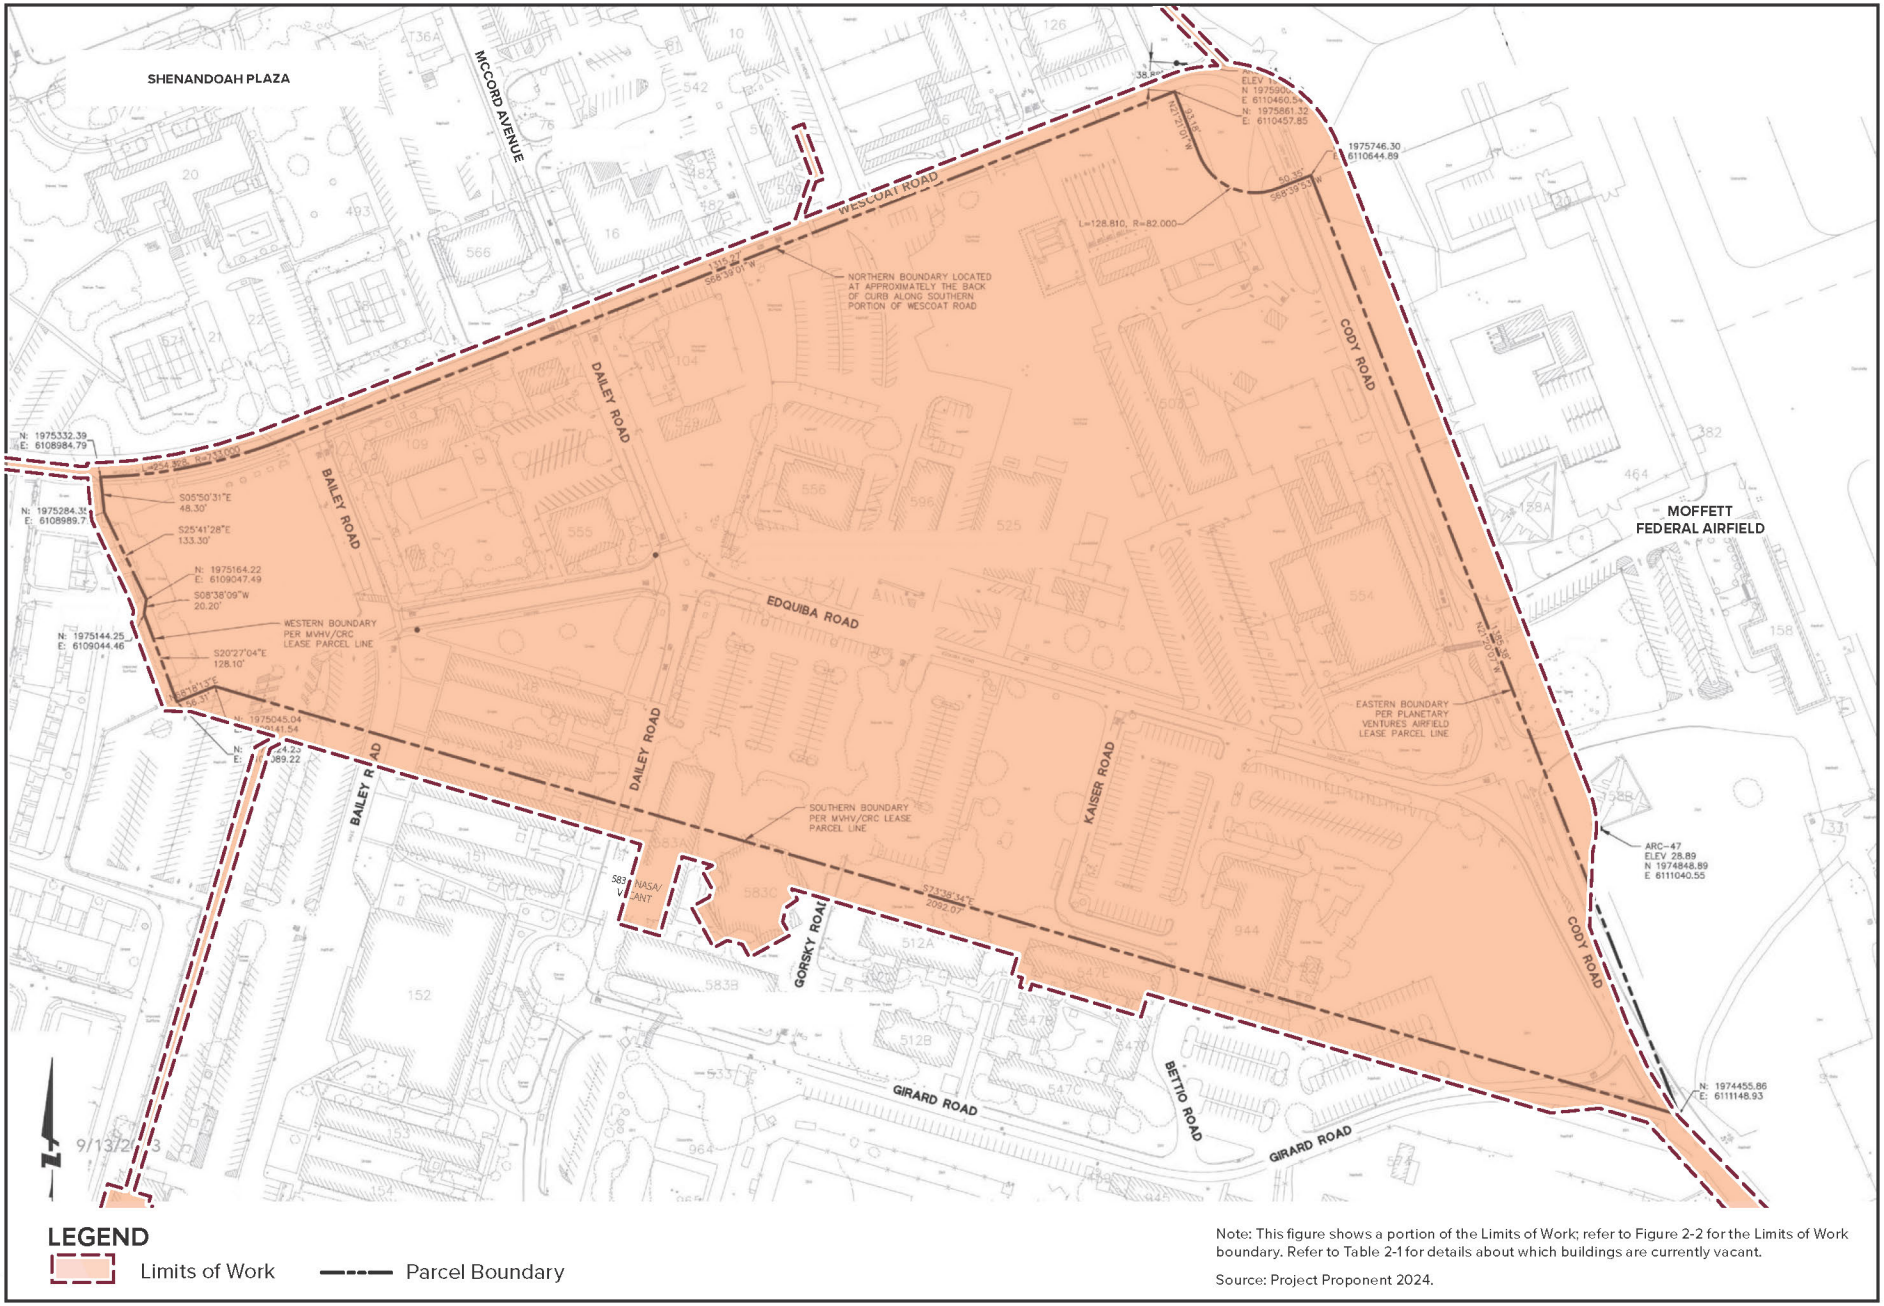
Figure 2-3
Existing Conditions (Project Site)
Berkeley Space Center at NASA Research Park

Regional access to the Project Site is provided by U.S. 101, approximately 0.2 mile to the south; State Route (SR) 85, approximately 0.7 mile to the southwest; and SR 237, approximately 1.0 mile southeast. In addition, the Bayshore/NASA Santa Clara Valley Transportation Authority (VTA) light rail station is located off Manila Avenue just southeast of the Project Site, between Macon Road and U.S. 101, providing daily service between Mountain View and Alum Rock, with connections to Altamont Corridor Express (ACE) and Capitol Corridor trains, the Milpitas Bay Area Rapid Transit (BART) station, and the Mountain View Caltrain station. The majority of the Project Site is within 0.5 mile of the Bayshore/NASA VTA light rail station and also close to the VTA bus stops on North Akron Road and South Akron Road.

2.2.2 Existing Conditions



The Limits of Work are currently developed with 18 one- to three-story buildings that total approximately 185,600 square feet (including approximately 132,500 square feet of vacant uses and approximately 53,100 square feet of occupied uses), along with surface parking lots, roadways, and utility infrastructure, as depicted in Figure 2-4, Existing Conditions Site Plan (Limits of Work). Table 2-1 summarizes the condition of the existing buildings within the Limits of Work. The existing buildings are mostly vacant; many were formerly used as ancillary buildings that supported Navy operations (e.g., offices, food service, a gas station, pool, recreation center, and lodging). The other existing buildings within the Limits of Work comprise industrial, storage, and utility facilities. The buildings range in height from approximately 15 to 45 feet above the finished grade. In addition, there are approximately 900 existing parking spaces within the Limits of Work. Eight transformers are associated with Buildings 104, 149, 554, 556, 583C, 596, and 944. No emergency generators are currently located within the Limits of Work.

As of mid-2024, approximately 42 people were employed within the Limits of Work; no full-time residents or short-term occupants (e.g., summer interns) lived within the Limits of Work.

The Project Site is relatively flat, with existing grades gradually sloping from south to north. The Project Site is currently covered with a substantial amount of impervious hardscape. This includes buildings, building pads, roads, surface parking lots, streets, and paths, which, in total, cover approximately 70 percent of the Project Site. Vegetation on the Project Site is largely the result of landscaping that was associated with structures on the Project Site. Trees currently on the Project Site include native trees, such as coast redwood, and adapted non-native trees, such as London plane and Canary Island pine, which are located throughout the Project Site but primarily within the southern portion of the Project Site. Existing landscaping includes approximately 245 trees located throughout the Project Site. Approximately 16 percent of the trees are in good condition, 56 percent of the trees are in fair condition, 27 percent of the trees are in poor condition, and 1 percent of the trees are dead.[15]

555	Office (administration)	5,270	Occupied (research & design space)
556	Office	10,436	Occupied (research & design space)
583A	Lodging (former NASA Exchange Lodge)	30,900	Vacant
583C	Office (administration)	13,140	Vacant
596	Retail (former convenience store)	4,784	Vacant
944	Recreation (former recreation center)	14,794	Vacant
Total	—	***185,557***	—

Source: NASA 2024.

Notes:

sf = square feet; n/a = not available

a. Building 104 is an electrical substation that is currently in use but does not contain occupiable space.

b. Building 108 is a vacant outdoor swimming pool and is not a building.

Soil and groundwater at the Project Site have been affected by contamination associated with the Middlefield-Ellis-Whisman (MEW) Superfund site and the U.S. Navy's operations at Naval Air Station Moffett Field, which is no longer in operation. As a result, the Project Site is located within the MEW Superfund site and former Naval Air Station Moffett Field Superfund site. Under a ROD from the Department of Justice, the MEW Superfund Site Companies (MEW Companies) have been conducting soil and groundwater cleanup at the MEW site for approximately three decades.[16] Responsibility for remediation of the contaminated groundwater is allocated among the MEW Regional Groundwater Remediation Program, the Navy, and NASA, referred to as the Responsible Parties. Ongoing remediation activities in the vicinity of the Project Site continue to be implemented under the jurisdictions of the U.S. Environmental Protection Agency (EPA) and California Regional Water

[16] NASA. 2024. *2023 Annual Progress Report, NASA Ames Regional Groundwater Remediation Program, NASA Area of Responsibility, Site 28 WATS Area, and Site 26*. April 12, 2024.

Quality Control Board (RWQCB). Specifically, two groundwater extraction and treatment facilities for the remediation of volatile organic compounds (VOCs) are currently operating within proximity of the Project Site at NASA ARC: the MEW Superfund Site and the NASA-owned and operated West-Side Aquifers Treatment System (WATS). The MEW extraction and treatment system is directly adjacent to and within the Project Site. Within the Project Site are several recovery wells and underground piping for the treatment system.[17] The MEW system treats approximately 50 million gallons per year (mgy), with an average daily flow of 140,000 gallons per day (gpd) of contaminated groundwater. Treated water from the MEW facility is discharged into San Francisco Bay from an outfall in Stevens Creek. The WATS is west of Hangar One, approximately 1,000 feet north of the Project Site. It treats approximately 28 mgy of contaminated groundwater, with an average daily flow of approximately 50,000 to 75,000 gpd. Treated groundwater from the WATS is discharged into NASA's stormwater retention pond at the northernmost portion of NASA ARC. In addition, many of the buildings within the Project Site contain hazardous materials, such as asbestos-containing material (ACM) and lead-based paint (LBP); electrical equipment contains polychlorinated biphenyl (PCBs). Furthermore, hazardous materials have been or are being stored within the Project Site.

Because the Project Site is located within NASA ARC, access to the Project Site is currently controlled through security and visitor checkpoints located at the main gate on Clark Road or at the gate located on Ellis Street. Once through the controlled gates, existing roadway access to the Project Site within NASA ARC is provided from driveways on Wescoat Road, Cody Road, Dailey Road, and Edquiba Road.

2.2.3 Land Use Designations

2.2.3.1 NASA Ames Development Plan

The NADP is a comprehensive long-range land use plan that guides the use, renovation, management, and development of facilities at the approximately 2,000-acre NASA ARC. As mentioned above, of the four planning areas identified within the NADP, the Project Site is within the NRP planning area. The NRP covers approximately 86 acres in the southwestern portion of NASA ARC. It is bordered by the Eastside/Airfield planning area, the NASA ARC planning area, military housing operated by a private developer on behalf of the Department of War, and U.S. 101. Under the NADP, allowed development within the NRP planning area includes laboratories, office space, classrooms, auditoriums, museums, a conference center, open space, a burrowing owl preserve, parking, housing, and limited retail facilities. The Project Site is located within the NRP planning area on parcels designated for educational and research and development/office facilities. The NADP used floor area ratios (FARs) to identify preferred densities at the time it was prepared, but the FARs are not regulatory requirements. Thus, there is no minimum or maximum FAR applicable to the Project Site and the developable area established by the Project Proponent's Enhanced Use Lease applies to the Project Site.

2.2.3.2 Local Land Use Plans

As discussed in Section 2.5, *Reviews and Approvals by Lead Agencies, Responsible Agencies, and Other Agencies*, UC Berkeley and NASA are not subject to municipal regulations of surrounding local governments, such as general plans. Nonetheless, information about Santa Clara County's and the City of Mountain View's general plans is provided for informational purposes only.

[17] Geosyntec Consultants, Inc. 2024. *2023 Annual Progress Report, Middlefield-Ellis-Whisman Fairchild and Regional Groundwater Remediation Programs, Mountain View, California*. April 11, 2024. Figure 6.

Santa Clara County

The Project Site is within an unincorporated area of Santa Clara County. Under the Santa Clara County (County) General Plan, the Project Site is designated as a Public Facility, a designation used for lands located outside of city or county urban service areas that are owned or operated by federal, state, or local governments for government purposes. Public Facility uses could include county government centers; federal government land, including lands used for defense or research installations; or other facilities of federal, state, or local governments. The Project Site is zoned A-1, General Use, under the County's Zoning Ordinance.

City of Mountain View

The City of Mountain View's 2030 General Plan designates the Project Site as Institutional. The permitted range of uses supports public and quasi-public uses that serve an essential regional and/or local function. These include NASA ARC facilities as well as facilities owned by federal, state, or county governments. The Project Site is not covered by any of the zoning districts of Mountain View; however, it falls within the Local Agency Formation Commission (LAFCO) Sphere of Influence for Mountain View.

2.3 Description of the Proposed Project/Proposed Action and Alternatives

As more fully described below, the proposed project under consideration by NASA (i.e., the proposed action) would include Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, Short-Term Lodging, transportation networks, and open spaces as well as landscaped spaces, to create a state-of-the-art research and education hub. The proposed project includes utility improvements and building demolition in Off-Site Areas (i.e., areas outside of the Project Site and within the Limits of Work), as discussed in Section 2.3.7, *Off-Site Utility Improvements and Demolition*. Implementation of the proposed project would include demolition of all existing buildings within the Limits of Work. Figure 2-5, Conceptual Site Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative,[18] shows the conceptual site plan for the proposed project. Figure 2-6, Conceptual Land Use Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative, shows the proposed types of land uses.

Pursuant to NEPA, this joint EIR/EIS evaluates the following alternatives at an equal level of detail:

- **CEQA Proposed Project (NEPA Build Alternative 1)**, which would create approximately 2.3 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. The CEQA Proposed Project would include approximately 2 million square feet for Research and Office Uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 130,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging. Table 2-2 summarizes the similarities and differences between the CEQA Proposed Project and the CEQA Reduced Density Alternative. Only the CEQA Proposed Project includes the WRF Option

[18] Both the parcel boundary and the Project Site boundary are shown in some of the conceptual plans provided throughout this chapter. The parcel boundary includes the leased premises; it is provided for informational purposes only. The Project Site boundary includes the area that would be redeveloped as part of the proposed project.

(see Section 2.3.6.2, *Recycled Water*) and the CUP Option (see Section 2.3.6.8, *Heating, Ventilation, and Air-Conditioning Systems*).

- **CEQA Reduced Density Alternative (NEPA Build Alternative 2)**, which would create approximately 1.4 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. Compared to the CEQA Proposed Project, the CEQA Reduced Density Alternative would provide less space for Research and Office Uses. The CEQA Reduced Density Alternative would include approximately 1.1 million square feet for Research and Office Uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active Uses, 130,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging. Table 2-2 summarizes the similarities and differences between the CEQA Proposed Project and the CEQA Reduced Density Alternative.
- **NEPA No-Action Alternative**, under which the proposed action would not be constructed and operated at the Project Site. The buildings within the Limits of Work that are currently operational would continue to be operational. The buildings within the Limits of Work that are currently vacant would be reoccupied consistent with the prior uses of the buildings (e.g., ancillary buildings that supported Navy operations as well as industrial, storage, and utility facilities); reoccupying the vacant buildings would not require construction activity. The NADP, which established NASA's vision for long-term development of NASA ARC, also allows other types of uses at the Project Site. The NEPA No-Action Alternative could result in retaining the approximately 185,600 square feet of existing mixed uses, resulting in approximately 668 employees.[19] The NEPA No-Action Alternative would not result in the reoccupation of any buildings formerly used for lodging; thus, the NEPA No-Action Alternative would not generate any new full-time residents or short term occupants (e.g., summer interns) within the Limits of Work.

Consistent with the guidance in State CEQA Guidelines Sections 15126.6(d) and 15126.6(e), the following two additional alternatives are evaluated and compared to the CEQA Proposed Project. The CEQA Proposed Project, the CEQA Proposed Project with the Variant, the CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant are discussed throughout this joint EIR/EIS, whereas the two additional alternatives below are discussed in Chapter 5, *Other CEQA Information and Alternatives*:

- **CEQA No-Project/Existing Conditions Alternative**, under which the Project Proponent would not construct and operate the CEQA Proposed Project at the Project Site. The buildings within the Limits of Work that are currently operational would continue to be operational, and the buildings within the Limits of Work that are currently vacant would remain vacant.[20]
- **CEQA Reduced Height Alternative**, which would create approximately 2 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. Compared to the CEQA Proposed Project, the CEQA Reduced Height Alternative would achieve lower maximum building height in some areas. In addition, the CEQA Reduced Height Alternative would provide less space for Research and Office Uses and less space for Student/Faculty Housing compared to the CEQA Proposed Project. The CEQA Reduced Height Alternative would include approximately 1.66 million square feet for Research and Office uses, 25,000 square feet for Conference Uses, 90,000 square feet for Active

[19] This is based on a generation rate of 3.6 employees per 1,000 square feet.

[20] This provides a conservative analysis under CEQA for the purposes of comparison.

Uses, 100,000 square feet for Student/Faculty Housing, and 75,000 square feet for Short-Term Lodging.

Table 2-2 summarizes the similarities and differences between the CEQA Proposed Project and the CEQA Reduced Density Alternative. The primary differences between the CEQA Proposed Project and CEQA Reduced Density Alternative would be the number of internal floors, internal floor-to-floor heights, the amount of square footage for Research and Office Uses, the number of employees, the number of students, and the number of parking spaces. The internal floor-to-floor heights could be lower under the CEQA Proposed Project to accommodate more square footage in each building, whereas the internal floor-to-floor heights under the CEQA Reduced Density Alternative could be higher because less square footage would need to be accommodated in each building. A range of floor-to-floor heights is provided in the proposed Development Guidelines for guidance. The CEQA Proposed Project and CEQA Reduced Density Alternative would have the same types of land uses at the same locations; the same site plan; the same maximum building height; the same amount of square footage for Conference Uses, Active Uses, Student/Faculty Housing, Short-Term Lodging, and open space; the same number of residents and guests; the same utility infrastructure and roadways; and the same parking ratio.

Table 2-2. Summary of Similarities and Differences between the CEQA Proposed Project and the CEQA Reduced Density Alternative

Characteristic	CEQA Proposed Project (NEPA Build Alternative 1)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)
Similarities		
Types of Land Uses	Same	
Location of Land Uses	Same (see Figure 2-6)	
Site Plan	Same (see Figure 2-6)	
Limits of Work (i.e., Project Footprint)	Same (45 acres, including 39-acre Project Site and 6 acres of Off-Site Areas)	
Maximum Building Height[a]	Same (Approximately 80 feet, with an exceedance of up to 25 feet for mechanical screens)	
Amount of Conference Uses, Active Uses, Student/Faculty Housing, Short-Term Lodging, and Open Space	Same (25,000-square-feet of Conference Uses, 90,000 square feet of Active Uses, 145 Student/Faculty Housing units, 100 Short-Term Lodging units, and a minimum of 10 acres of open space)	
Number of Residents and Guests	Same (200 guests and 363 residents)	
Utility Infrastructure and Roadways[b]	Same	
Parking Ratio	Same	
Construction Start and End Dates	Same (begin in 2027 and end in 2040)	
No Student/Faculty Housing Variant/Sub-Alternative	Same (Variant included)	

Characteristic	CEQA Proposed Project (NEPA Build Alternative 1)	CEQA Reduced Density Alternative (NEPA Build Alternative 2)
Differences		
Number of Internal Floors[a]	Greater to accommodate increased square footage and building height restriction	Less given reduced overall square footage
Internal Floor-to-Floor Heights[a]	Lower to accommodate increased square footage and building height restriction	Higher given reduced overall square footage
Amount of Square Footage for Research and Office Uses	Greater (2,000,000 square feet)	Less (1,080,000 square feet)
Number of Employees and Students[c]	Greater (5,997 employees and 177 students)	Less (3,331 employees and 95 students)
Number of Parking Spaces[c]	Greater	Less
WRF Option and CUP Option[d]	Yes	No

Source: Proposed Berkeley Space Center Development Guidelines, Spring 2026.

Notes:

WRF = Water Reuse Facility; CUP = Central Utility Plant

a. The internal floor-to-floor heights could be lower under the CEQA Proposed Project to accommodate more square footage in each building, whereas the internal floor-to-floor heights under the CEQA Reduced Density Alternative could be higher because less square footage would need to be accommodated in each building.

b. Only the CEQA Proposed Project includes the WRF Option and the CUP Option; see footnote "d" for more information regarding these options. The proposed roadways would be the same.

c. The difference in the number of employees, students, and parking is due to the greater amount of Research and Office Uses that would be included in the CEQA Proposed Project.

d Under the WRF Option, portions of the non-potable demand would be met using on-site reuse supply rather than recycled water from Mountain View. The non-potable demand that cannot be met by the WRF Option would require the use of potable water. The CUP Option would provide a centralized heating and cooling system for all buildings instead of building-by-building heating, ventilation, and air-conditioning (HVAC) systems.

Table 2-3 summarizes the proposed maximum square footage of land uses for the CEQA Proposed Project, the CEQA Reduced Density Alternative, and the NEPA No-Action Alternative.

Table 2-3. Summary of Proposed Maximum Square Footages of Land Uses for the CEQA Proposed Project and the CEQA Reduced Density Alternative

Land Use	CEQA Proposed Project (NEPA Build Alternative 1) (sf)	CEQA Reduced Density Alternative (NEPA Build Alternative 2) (sf)	NEPA No-Action Alternative (sf)[a]
Research and Office Uses	2,000,000	1,080,000	40,072
Office	*350,000*	*190,000*	*30,612*
Lab and R&D	*1,390,000*	*750,000*	*9,460*
Academic	*260,000*	*140,000*	—
Conference Uses	25,000	Same	—
Active Uses	90,000	Same	—

Land Use	CEQA Proposed Project (NEPA Build Alternative 1) (sf)	CEQA Reduced Density Alternative (NEPA Build Alternative 2) (sf)	NEPA No-Action Alternative (sf)[a]
Housing & Lodging	205,000	Same	82,598
Short-Term Lodging	*75,000*	Same	—
Student/Faculty Housing	*130,000*	Same	—
Other Lodging[b]	—	—	*82,598*
Recreation	—	—	20,090
Utility	n/a[c]	n/a[c]	n/a[c]
Industrial	—	—	34,733
Storage	—	—	3,280
Retail	—	—	4,784
Total	***2,320,000***	***1,400,000***	***185,557***

Source: Proposed Berkeley Space Center Master Plan, Spring 2026. See Appendix 2-1 of this joint EIR/EIS.
Notes:
sf = square feet; R&D = research and development; n/a = not applicable

a. Under the NEPA No-Action Alternative, the buildings within the Limits of Work that are currently operational would continue to be operational. The buildings within the Limits of Work that are currently vacant would be reoccupied consistent with the prior uses of the buildings.

b. Lodging is classified as barracks that were formerly used by the Navy.

c. Utility support structures do not contain occupiable uses.

2.3.1 Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines

The proposed project will include the proposed Berkeley Space Center Master Plan (Master Plan), which establishes the overall project vision, conceptual plans, and illustrative renderings, and the proposed Berkeley Space Center Development Guidelines (Development Guidelines), which provide Maximum and Minimum Development Parameters and Standards for the proposed project buildings and open space. The Maximum and Minimum Development Parameters are a conceptual layout depicting the horizontal and vertical dimensions of the proposed project. Standards are mandatory requirements that would be required to be implemented for the proposed project. Together, the Master Plan and the Development Guidelines will be included as part of the project application submitted by the Project Proponent to NASA. NASA will review and consider for approval the Master Plan and Development Guidelines as part of the proposed project.[21] The analysis of the environmental impacts of the proposed project is based on the proposed Maximum and Minimum Development Parameters and Standards established in the Development Guidelines. Appendix 2-1 of this joint EIR/EIS includes the proposed Master Plan, Development Guidelines, and Standards.

21 Upon issuance of the ROD for the proposed project, the Master Plan, Development Guidelines, Spring 2026 project-specific EIMP, project-specific TDM Plan, and other project documents will apply to the Project Site.

The proposed project will adhere to the proposed Development Guidelines, which include a regulatory framework to manage the proposed redevelopment; the regulatory framework is categorized as principles, guidelines, and standards:

- Principles – Defined as aspirational targets that convey the design intent of the proposed Master Plan but are not mandated through regulatory requirements.
- Guidelines – Measures that are not required to be implemented for the proposed project but are advised or strongly encouraged.
- Standards – Defined as mandatory requirements that would be required to be implemented for the proposed project.

The proposed project is depicted in the conceptual plans provided throughout this chapter (Figures 2-5 to 2-9 and Figures 2-12 and 2-13, and Figures 2-15 to 2-21) and the visual simulations in other chapters showing illustrative renderings (e.g., Figures 1 to 12 in the *Aesthetics and Visual Resources CEQA Evaluation* included in Appendix 3.2-1 of this joint EIR/EIS). Conceptual plans serve as a framework for general site orientation and the placement of land uses, open spaces, transportation, and infrastructure, as well as the general scale and massing of development, and overall architectural themes. Conceptual plans are intended to convey the general vision and design of the proposed project while allowing flexibility in interpretation and implementation. The visual simulations show illustrative renderings of one possible example of development that would substantially conform to massing, scale, height and other applicable standards (i.e., the maximum mechanical screen height and the Maximum and Minimum Development Parameters and Standards established in the proposed Development Guidelines). Illustrative renderings are not determinative of the ultimate configuration, building orientation, massing, architectural and landscaping details, or parking. Table 2-4 summarizes the proposed Maximum and Minimum Development Parameters and Standards.

Table 2-4. Summary of Proposed Maximum and Minimum Development Parameters and Standards

Topic/Page	Standard	Minimum Development Parameter (if applicable)	Maximum Development Standard (if applicable)
Site: maximum development parameters	• Building height • Mechanical screens • Setbacks in stepdown zone along Wescoat Road and Cody Road in Subareas 1, 2, 3, and 6	n/a	• 80-foot building height in all Subareas except Subarea 7 • 30-foot building height in Subarea 7 • 105-foot mechanical screens • 15-foot set back required at 35-foot stepdown zone
Open space: acreage	• Required open space	10 acres	n/a
Open space: open space network	• Hangar Commons planting layout and palette shall maintain a clear view corridor from the Central Green to Hangar One. • Planting outside of Berkeley Space Center's leasehold boundary must comply with NASA height requirements to accommodate Hangar One door opening and aircraft movement.	n/a	n/a

Topic/Page	Standard	Minimum Development Parameter (if applicable)	Maximum Development Standard (if applicable)
Open space: program activation	• The Promenade shall be designed as a multi-modal, car-free pathway, linking the historic Shenandoah Plaza to the airfield through the center of the project. • Publicly accessible seating terraces and patios shall be located adjacent to the Promenade and along the interior emergency vehicle access (EVA) loop. • The character of these areas shall relate to the building spill-out zones. • Spill-out zones for terraces and patios are designated as shown along frontages.	n/a	n/a
Open space: hardscape	• The character of the hardscape materials, including grain, color and texture, shall reflect the industrial history and qualities of the site while maintaining a cohesive relationship with the architectural material palette and avoiding false historicism. • All paving surfaces shall use materials that can withstand daily use and wear and tear. • Materials shall be durable, made with natural materials, and utilize predominantly warm tones.	n/a	n/a
Open space: site lighting	• Site elements, including streetlights, pedestrian poles, bollards, litter bins, bicycle racks, benches, special features, etc., shall maintain a cohesive identity that complements the overall landscape and architectural material palettes and avoids false historicism. • Lighting shall be provided at the minimum levels required by the Illumination Engineering Society of North America (IESNA) lighting guidelines and relevant local	n/a	n/a

Topic/Page	Standard	Minimum Development Parameter (if applicable)	Maximum Development Standard (if applicable)
	code requirements, using no more light than is necessary. • Minimize impacts of necessary lighting by choosing low-glare sources. • Lighting standards and fixtures shall use efficient lighting technologies, including, but not limited, to LED technology. • Direct lighting away from native habitats by employing directional lighting with baffles, non-reflective tinting on windows, and other mechanisms. • Lighting fixtures shall comply with dark sky principles outlined by the International Dark-Sky Association (IDA), which involve incorporating shielding to restrict light emission beyond a 90-degree angle. • Lighting design and fixtures shall follow a clear hierarchy and be in scale with the context and surroundings.		
Open space: planting characteristics	The palette and irrigation shall comply with all local relevant regulatory requirements.	n/a	n/a
Buildings: land use and parking	• Location within the Subareas • Bike parking ratio • Vehicular parking ratio	n/a X n/a	n/a n/a X
Buildings: architectural characteristics	• The architectural character of Berkeley Space Center shall reflect its own time and the unique purposes of the research buildings, conveying a keen sense of place and identity, both for the immediate Berkeley Space Center area and within the broader NASA Ames Research Center, complementing the historic buildings and avoiding simulacrum.	n/a	n/a

Topic/Page	Standard	Minimum Development Parameter (if applicable)	Maximum Development Standard (if applicable)
	• Façades shall be articulated to convey a sense of human scale, denote building entries, and reinforce the design of streetwall. Material, color and texture use changes can create visual diversity through varied façade treatments. • Architectural character shall both complement the historic character of Shenandoah Plaza and provide a contemporary response to the new development as an urban research district. Façades shall be articulated to convey a sense of human scale, denote building entries and reinforce the design of the streetwall. • Durable building materials and systems that minimize long-term maintenance operations and costs shall be used, contributing positively to the innovation district's character and sustainability goals. Massing, material, and color shall be modulated to create a human-scaled public realm that minimizes the appearance of building bulk and mass and avoids visual clutter.		
Buildings: bird friendly design	As required, all building façades shall be designed with depth-of-shading members, fritted glass, and solid materials. Building designs shall comply with the California Green Building Standards Code (CALGreen) Non-Residential Voluntary Measure: A5-107 Bird-friendly Building Design.	n/a	n/a
Buildings: mechanical screening	• Mechanical screening height above the maximum building height. • Mechanical equipment and rooftop appurtenances must be screened. Mechanical equipment must not be visible from the street	n/a n/a	25 feet n/a

Topic/Page	Standard	Minimum Development Parameter (if applicable)	Maximum Development Standard (if applicable)
	level and views from adjacent, taller buildings shall be minimized.		
	• Setback for mechanical screens measured from the maximum development parameters along Wescoat Road and Cody Road.	n/a	45-degree setback
Building: loading docks	Service, security, or garage doors shall not be placed along façades adjacent to public streetscapes, plazas, and parks. If this cannot be avoided, the doors shall be placed in a manner that reduces their visibility by recess or other methods that incorporate them into the greater architecture of the building.	n/a	n/a
Building: work yards	Screening: On their sidewalk edge, working yards shall be screened from direct public view, based on tenant needs, security, and/or safety for passers-by. If programmatic constraints prevent the use of semi-transparent vertical screens, vegetated screen walls and/or building material textural variation are recommended to create a visually engaging environment.	n/a	n/a
Building: generators	Any large diesel emergency standby engines (> 1,000 brake horsepower) "Generators" to meet EPA Tier 4 Emission Standards through purchase of an EPA-certified Tier 4 engine (no initial or follow-up source testing required) or purchase of a Tier 4-compliant engine (packaged by the engine manufacturer with abatement equipment) (follow-up testing required every 3 years after district-approved source testing conducted before installation). The project shall comply with the regulatory requirement to use the Air District's Best Available Control Technology and Best Available Control Technology for Toxics (BACT/TBACT) workbook, revised June 9,	n/a	n/a

Topic/Page	Standard	Minimum Development Parameter (if applicable)	Maximum Development Standard (if applicable)
	2015, for commonly permitted sources subject to New Source Review in the Bay Area as a guide for permit applicants.		
Vehicular parking	• Driveways shall be minimized to the extent feasible on the primary bike network to minimize conflicts between bikers and vehicles. • Typical floor height shall be 10 feet. • Off-street parking shall be designed so that a vehicle will not have to back into a public right-of-way when exiting. • Ramping: The maximum slope of any driveway or ramp shall be 20 percent. • Ramps and ramped floors shall not face a street or publicly accessible open space. • No off-street parking shall be located in required front or streetside yards. • Screening: All parapet edges and/or facades shall be designed to screen or reduce the visual impact of vehicles from public view at all levels. • Lighting: Interior lighting fixtures of parking levels shall not be directly visible from outside of the parking facility.	n/a	n/a
Bike and scooter parking	• Convenient access to bicycle parking facilities shall be provided. Where access is via a sidewalk or pathway, curb ramps shall be installed where appropriate.	n/a	n/a
	• Lighting shall be provided in all bicycle parking areas. In both exterior and interior locations, lighting of not less than one footcandle of illumination at ground level shall be provided.	n/a	n/a

Topic/Page	Standard	Minimum Development Parameter (if applicable)			Maximum Development Standard (if applicable)
	• The number of short-term and long-term bicycle parking spaces provided shall meet the minimum bicycle parking ratios.	**Land Use**	**Short-Term Bicycle Parking**	**Long-Term Bicycle Parking**	n/a
		Office	0.1875 spaces/ 1,000 sf	0.75 spaces/ 1,000 sf	
		Lab and R&D	0.1875 spaces/ 1,000 sf	0.345 spaces/ 1,000 sf	
		Academic	1.5 spaces/ 10 students [b]	2.25 spaces/ 10 employees plus 1.5 spaces/10 students [b]	
		Conference Center	—	—	
		Active Uses	0.75 spaces/ 1,000 sf	0.15 spaces/ 1,000 sf	
		Short-Term Lodging	1.5 space/10 units	1.5 space/10 units	
		Student/ Faculty Housing	1.5 space/10 units	1.5 space/10 units

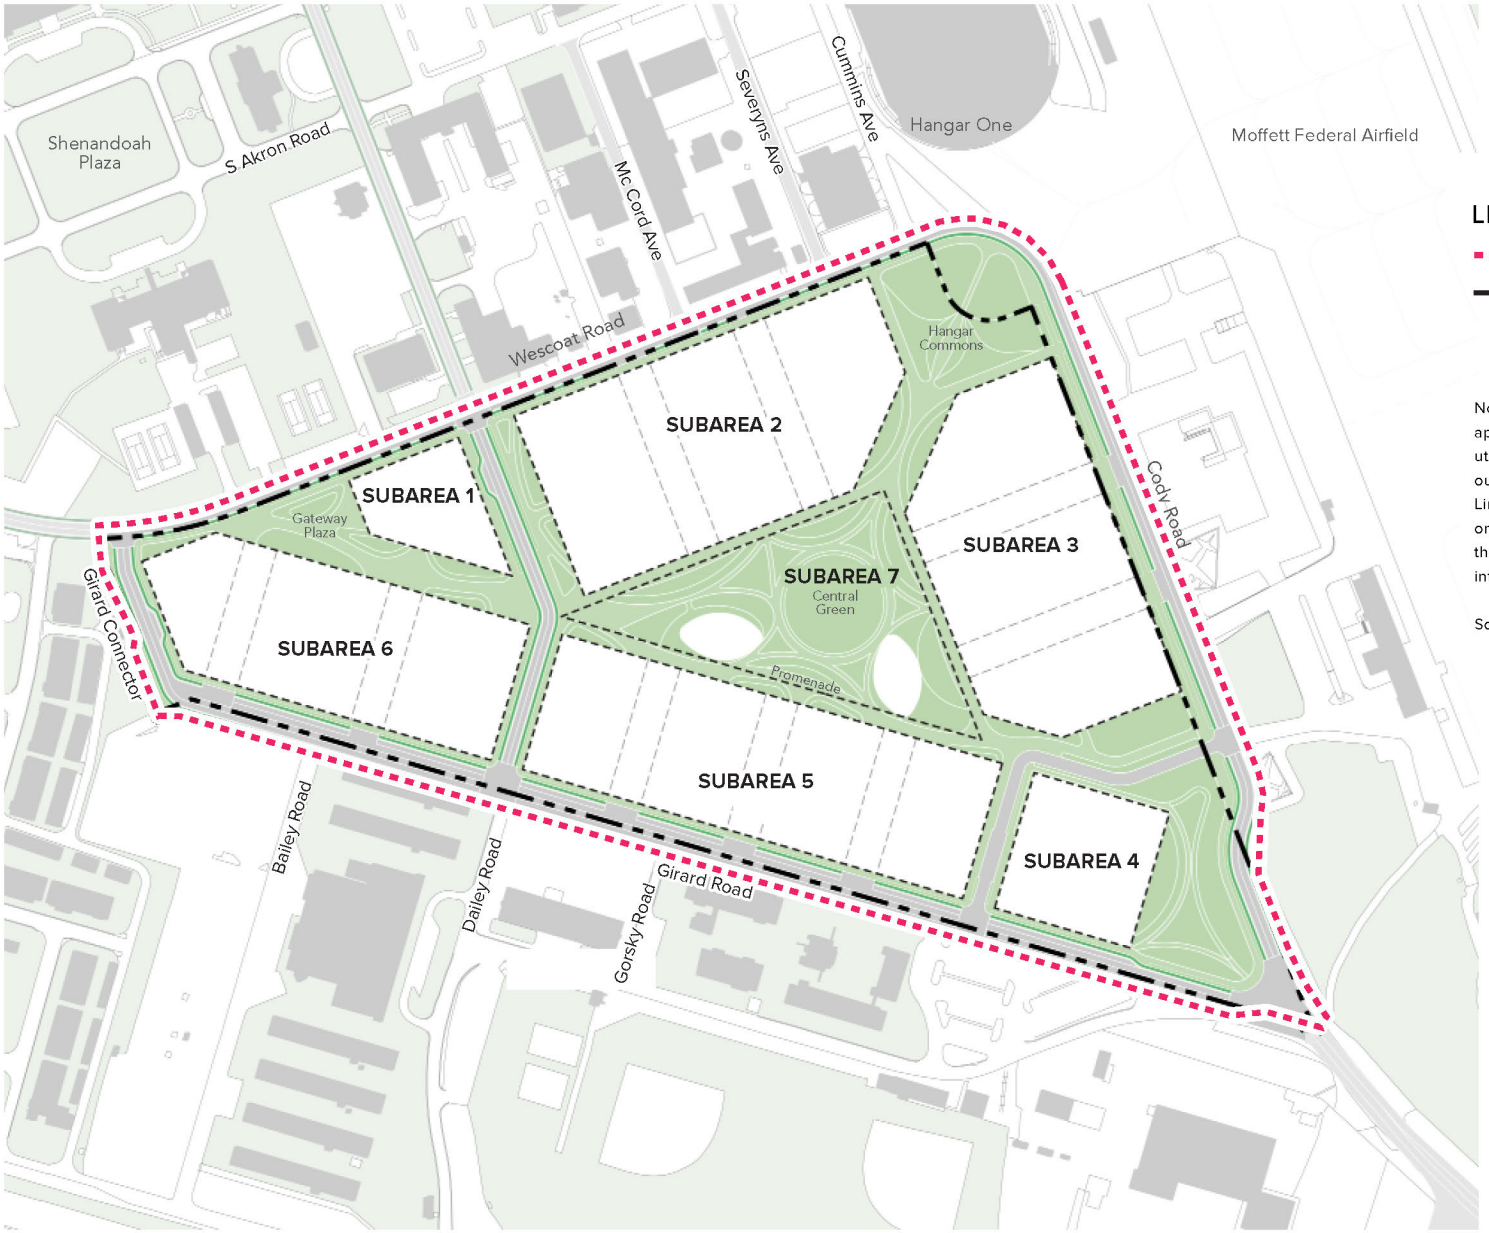
Notes:
n/a = not applicable

The analysis of the environmental impacts of the proposed project is based on the proposed Maximum and Minimum Development Parameters and Standards.

NASA will review and consider for approval the Master Plan and Development Guidelines as part of the proposed project.[22] Upon completion of the NEPA process, the specifics regarding each building's architectural design and configuration within the Project Site will be reviewed for conformance and approval through NASA's NRP Design Review Board process (pursuant to Ames Procedural Requirement [APR] 8822.1). The Design Review Program is typically a two-stage process: Pre-Conceptual Design Review (to adequately define the scope of a project, to determine the level of environmental review needed for site approval, and to ensure that an applicant conforms to applicable requirements) and Preliminary Design Review (which includes submission for the Concept Design Phase [CDP]). The NEPA process would address the purpose of the Pre-Conceptual Design Review stage; thus, the need for a Pre-Conceptual Design submission for the proposed project may be waived. During the Preliminary Design Review stage, NASA will assess whether the design and configuration of the proposed project complies with the NADP and Project Site-specific NEPA documents, including the Maximum and Minimum Development Parameters and Standards, as documented in the Record of Decision (ROD). Overall project approval consistent with the procedures outlined in APR 8829.1 is required before NASA will issue any permits for construction for the proposed project.

2.3.2 Characteristics



The characteristics described in the following sections apply to the proposed project (i.e., both the CEQA Proposed Project and CEQA Reduced Density Alternative), unless otherwise specified.

2.3.2.1 Site Plan

The site plan shown in Figure 2-5 would be the same for the CEQA Proposed Project and CEQA Reduced Density Alternative. There are seven Subareas within the Project Site; buildings would be situated within the Subareas and oriented around a large open space in the center of the Project Site, referred to as the Central Green. The Central Green would be within Subarea 7 and include Active Uses. The proposed Research and Office Uses would be along the perimeter of the Project Site, within Subareas 2, 3, 5, and 6. The proposed Student/Faculty Housing would be in Subarea 6, and the proposed Short-Term Lodging and Conference Uses would be in the southwest corner of the Project Site, within Subarea 1. The proposed parking garages would be in the southeast and southwest corners of the Project Site, within Subareas 4 and 6. Vehicular access to the Project Site would be provided along Wescoat Road, a realigned Cody Road, and a realigned Girard Road, as described in Section 2.3.5, *Transportation and Circulation*, under the *Site Access* subheading. The CEQA Proposed Project and CEQA Reduced Density Alternative also include a network of bicycle and pedestrian pathways, open spaces, and active/passive recreational areas.

[22] Upon issuance of the ROD for the proposed action, the Master Plan, Development Guidelines, Spring 2026 project-specific EIMP, project-specific TDM Plan, and other Project Site-specific documents will apply to the Project Site.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

Figure 2-5

Conceptual Site Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative

Berkeley Space Center at NASA Research Park

2.3.2.2 Buildout Assumptions

The future sub-tenants of the proposed Research and Office Uses are not known at this time, and, because the CEQA Proposed Project and CEQA Reduced Density Alternative would be constructed over a period of years, the exact configuration of certain project elements has not yet been determined. Thus, the description of the CEQA Proposed Project and CEQA Reduced Density Alternative is based on conservative buildout assumptions regarding certain aspects of the project design within the Subareas, as shown in Table 2-5. The proposed FAR (i.e., the total proposed square footage divided by the total parcel boundary [34.92 acres]) for the CEQA Proposed Project is 1.6 and the proposed FAR for the CEQA Reduced Density Alternative is 1.0.

Table 2-5. Buildout Assumptions for the CEQA Proposed Project and CEQA Reduced Density Alternative

Project Characteristics that Could Vary	Project Characteristics that Would Not Vary
Buildings/Structures	
• Number and configuration of buildings • Design of the buildings • Building floor to floor heights • Specific locations of mechanical equipment • Principles and Guidelines[a] identified in the proposed Development Guidelines	• Maximum and Minimum Development Parameters • Standards[b] identified in the Development Guidelines
Site Design and Infrastructure	
• Dimensions of roads, driveways, travel lanes, and sidewalks • Size and specific location of underground utility infrastructure, dependent on route selected • Principles and Guidelines[a] identified in the proposed Development Guidelines	• Locations of primary vehicular roads (Wescoat Road, Cody Road, Girard Road, Girard Connector, Subarea 4 Street, and Dailey Road) • General locations of mechanical equipment, transportation, and circulation improvements, utility infrastructure, and minimum sustainability features • Parking ratios by use • Standards[b] identified in the proposed Development Guidelines
Uses	
• Allocation of permitted uses among or within the buildings • Specific locations of uses within each Subarea (e.g., Research and Office Uses could occur anywhere within Subarea 2), except for those specific uses identified in this table that would not vary. • Principles and Guidelines[a] identified in the proposed Development Guidelines	• Locations of the Subareas • Types of permitted uses • Locations of the following specific uses proposed within each Subarea would occur within the Subareas shown in Figure 2-6: o Research and Office Uses o Conference Uses o Student/Faculty Housing o Short-Term Lodging o Parking • Active Uses would occur only within portions of Subareas 1 through 3 and 5 through 7, as shown in Figure 2-6. • Minimum of 10 acres of publicly accessible open space and landscaping for public use, in the

Project Characteristics that Could Vary	Project Characteristics that Would Not Vary
	aggregate, located in the four locations conceptually shown in Figure 2-6: o Central Green o Hangar Commons o Promenade o Gateway Plaza • Standards[b] identified in the proposed Development Guidelines • Maximum and Minimum Development Parameters

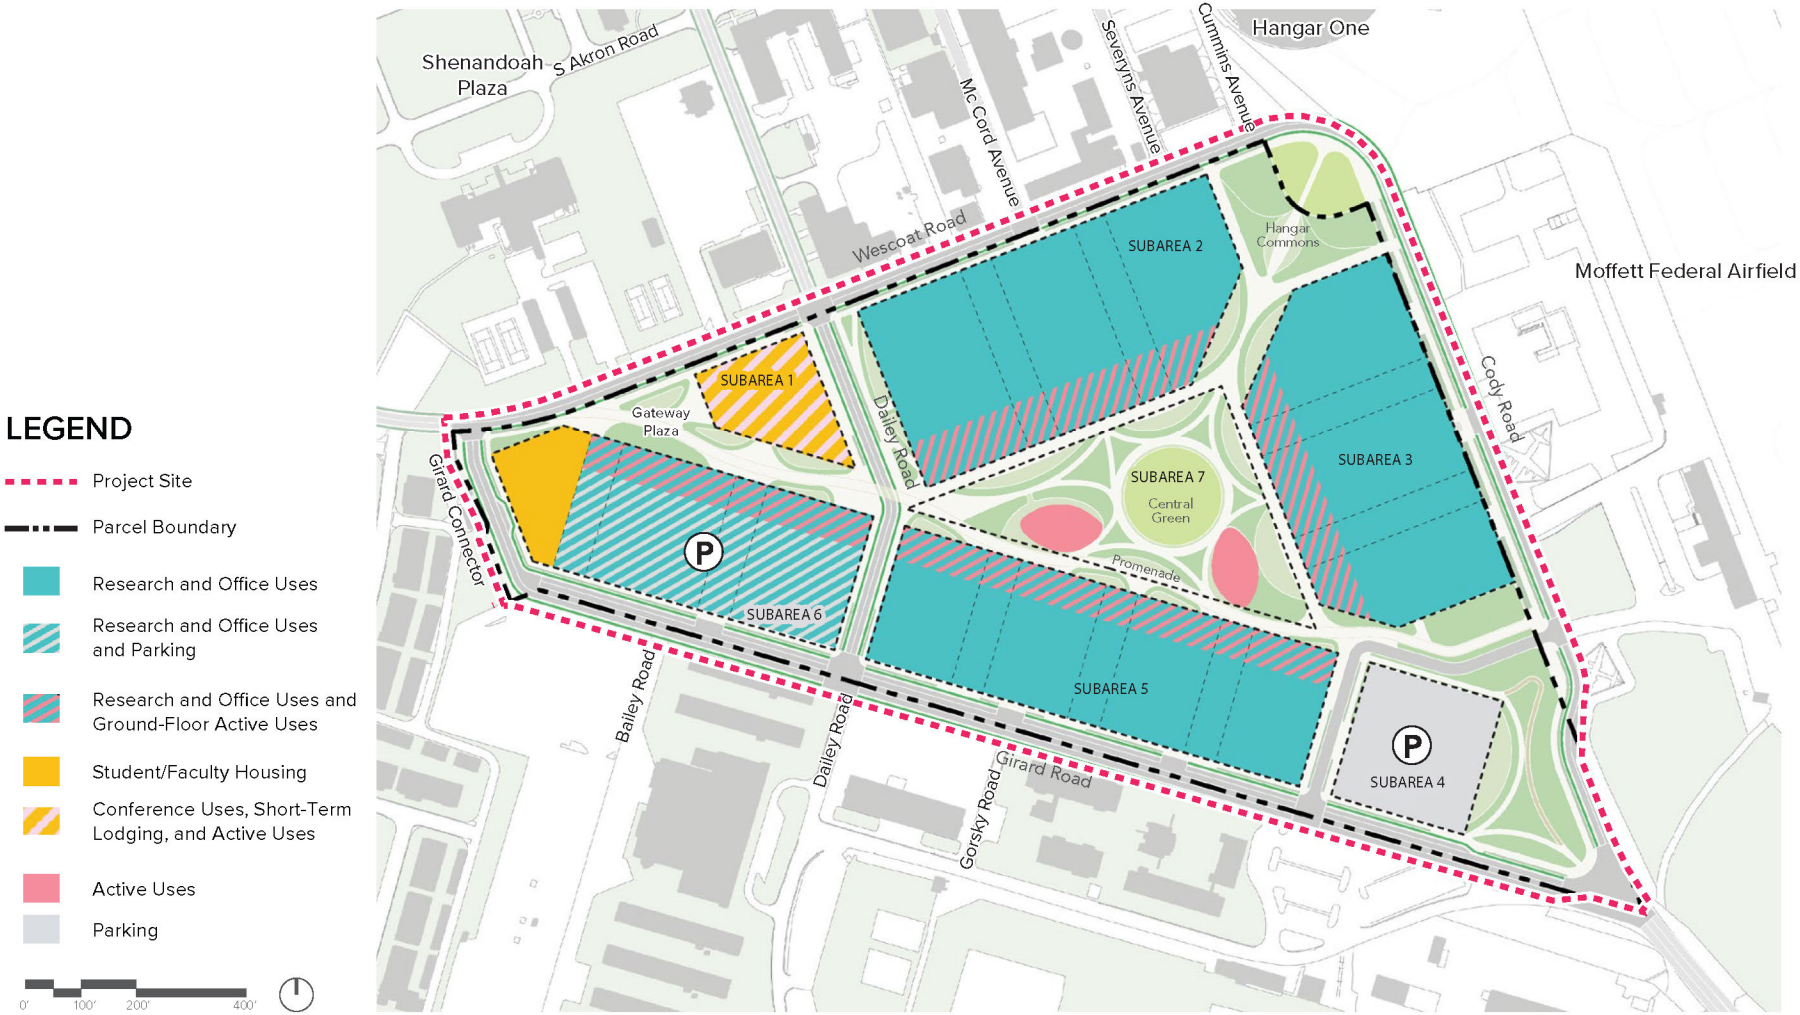
Source: Project Proponent, 2024.

Notes:

a. See definitions of "Principles" and "Guidelines" in Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*.

b. See definition of "Standards" in Section 2.3.1 and Table 2-4.

2.3.2.3 Land Uses



The conceptual land use plan shown in Figure 2-6 would be the same for the CEQA Proposed Project and CEQA Reduced Density Alternative. With respect to land uses, the primary difference between the CEQA Proposed Project and CEQA Reduced Density Alternative would be the amount of square footage for Research and Office Uses. The CEQA Proposed Project and CEQA Reduced Density Alternative would include the same amount of square footage for Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging. Tables 2-6 and 2-7 summarize the maximum square footage of proposed land uses for CEQA Proposed Project and CEQA Reduced Density Alternative, respectively.

Research and Office Uses

The CEQA Proposed Project would include more square footage for Research and Office Uses than the CEQA Reduced Density Alternative. The CEQA Proposed Project would consist of up to 2 million square feet of Research and Office Uses, whereas the CEQA Reduced Density Alternative would include just under 1.1 million square feet of Research and Office Uses. Research and Office Uses would include academic and research facilities, consisting of offices, laboratories, R&D, and related amenities. Research and Office Uses would be provided in Subareas 2, 3, 5, and 6, as shown in Figure 2-6.

Office uses would include space for corporate and general offices that would allow multiple tenants to carry out research and technology, administrative, and professional office activities. In addition, the proposed laboratory and R&D uses would provide functional spaces that could include laboratories, supportive administrative offices, meeting rooms, and light manufacturing or fabrication spaces as part of the overall R&D use. It is anticipated that private laboratory and R&D uses may include a range of activities potentially involving air quality and/or other hazard containment, intellectual property protection, and property security, which would be conducted in secure zones not accessible to the general public. Furthermore, as part of the Research and Office Uses, space for academic uses would be provided, consisting of educational spaces that would be shared by different educational users for testing, analysis, instruction, research, workspace, office, conferencing or other academic pursuits.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

Note: Images are conceptual until after project approval. The proposed project would include utility improvements and building demolition outside of the Project Site, but within the Limits of Work; the Limits of Work are depicted on Figure 2-2. The parcel boundary includes the leased premises; it is provided for informational purposes only.

sf = square feet; R&D = research and development

Laboratories constructed and operated as part of the CEQA Proposed Project and CEQA Reduced Density Alternative will comply with required federal, State, and local standards, in accordance with Ames Policy Directive (APD) 8829.1.[23] A small portion of the proposed laboratories associated with the Research and Office Uses would be categorized by biosafety levels (BSLs). Only BSL-1, BSL-2, and BSL-3 laboratories are included in the scope of the CEQA Proposed Project and CEQA Reduced Density Alternative; the proposed project would not include BSL-4 laboratories.[24]

Because of the nature of laboratory uses, the possibility exists for hazards related to the handling of hazardous materials (e.g., chemicals and chemical mixtures). In addition, in accordance with standard industry practices, the CEQA Proposed Project and CEQA Reduced Density Alternative, and any future tenant that handles qualifying hazardous materials, would be required to meet relevant Biosafety in Microbiological and Biomedical Laboratories (BMBL) and National Institute of Health (NIH) guidelines.

Conference Uses

The CEQA Proposed Project and CEQA Reduced Density Alternative would include the same amount of square footage for Conference Uses. The CEQA Proposed Project and CEQA Reduced Density Alternative would provide up to a 25,000-square-foot conference center with varying capacities (e.g., one large conference hall with satellite rooms to facilitate breakout sessions or more discrete and smaller scale conference requirements) to be used as temporary meeting spaces for use by UC Berkeley and other affiliated parties, private industry, or other public agencies. The Conference Uses could also include amenity space, which could include collaboration areas (i.e., shared working spaces), meeting/event rooms, a business center, gathering terraces and private open space, and other facilities supporting the Conference Uses. The Conference Uses could also include Active Uses (e.g., restaurants, gym).

Active Uses

The CEQA Proposed Project and CEQA Reduced Density Alternative would include the same amount of square footage for Active Uses. The CEQA Proposed Project and CEQA Reduced Density Alternative would include up to 90,000 square feet of ground-floor Active Uses that would be accessible by pedestrians. Active Uses could include display or exhibit areas for research, lobbies and seating areas, food and beverage facilities, a gym or other amenity facilities, shared maker spaces and fabrication workshops, co-working spaces, restaurants (including on-sale alcohol), community-serving retail, personal services (including, but not limited to, dry cleaning

[23] APD 8829.1 establishes the construction permit process and requirements for all construction activities at NASA ARC. The required standards include 29 Code of Federal Regulations (CFR) 1926, Safety and Health Regulations for Construction, and 29 CFR 1910, Occupational Safety and Health Standards, as well as the current adopted California Fire Code and California Building Code requirements addressing the prevention and control of dangerous conditions related to the storage, use, and handling of hazardous materials (California Code of Regulations [CCR] Title 24, Part 9).

[24] BSL-1 laboratories are used to study infectious agents or toxins not known to consistently cause disease in healthy adults. BSL-2 laboratories are used to study moderate-risk infectious agents or toxins that pose a risk if accidentally inhaled, swallowed, or exposed to the skin. BSL-3 laboratories are used to study infectious agents or toxins that may be transmitted through the air and cause potentially lethal infection through inhalation exposure. BSL-3 and BSL-4 laboratories are intended for the storage and study of acutely hazardous biomaterials (e.g., viruses, pathogens, microbes). More information about BSLs is available at https://www.cdc.gov/training/quicklearns/biosafety/#tab-nav.

pickup/drop-off, ATM, salons, bicycle repair), along with retail uses. Active Uses would be provided within Subareas 1, 2, 3, 5, 6, and 7. For the purposes of this joint EIR/EIS, it is assumed that approximately 10 percent of the Active Uses would include retail uses involving kitchens and approximately 90 percent of the Active Uses would include the remaining uses described above.

Student/Faculty Housing and Short-Term Lodging

The CEQA Proposed Project and CEQA Reduced Density Alternative would include the same amount of square footage for Student/Faculty Housing and Short-Term Lodging. The CEQA Proposed Project and CEQA Reduced Density Alternative would include approximately 145 Student/Faculty Housing units within Subarea 6. The proposed Student/Faculty Housing would be used by UC students or faculty on a short-term basis (i.e., academic calendar year, semester, or summer). Housing would prioritize the UC students and faculty affiliated with the CEQA Proposed Project or the CEQA Reduced Density Alternative as well as on-site federal employees and student interns, per the Project Proponent's Enhanced Use Lease requirements. The Student/Faculty Housing would include a mix of studio, one-bedroom, and two-bedroom apartments as well as amenity space. A minimum of 10 percent of the Student/Faculty Housing units would be affordable (i.e., affordable to households with 80 percent of Area Median Income, as adjusted for household size); a Residential Management Plan would provide oversight of the affordability requirements for the proposed project.

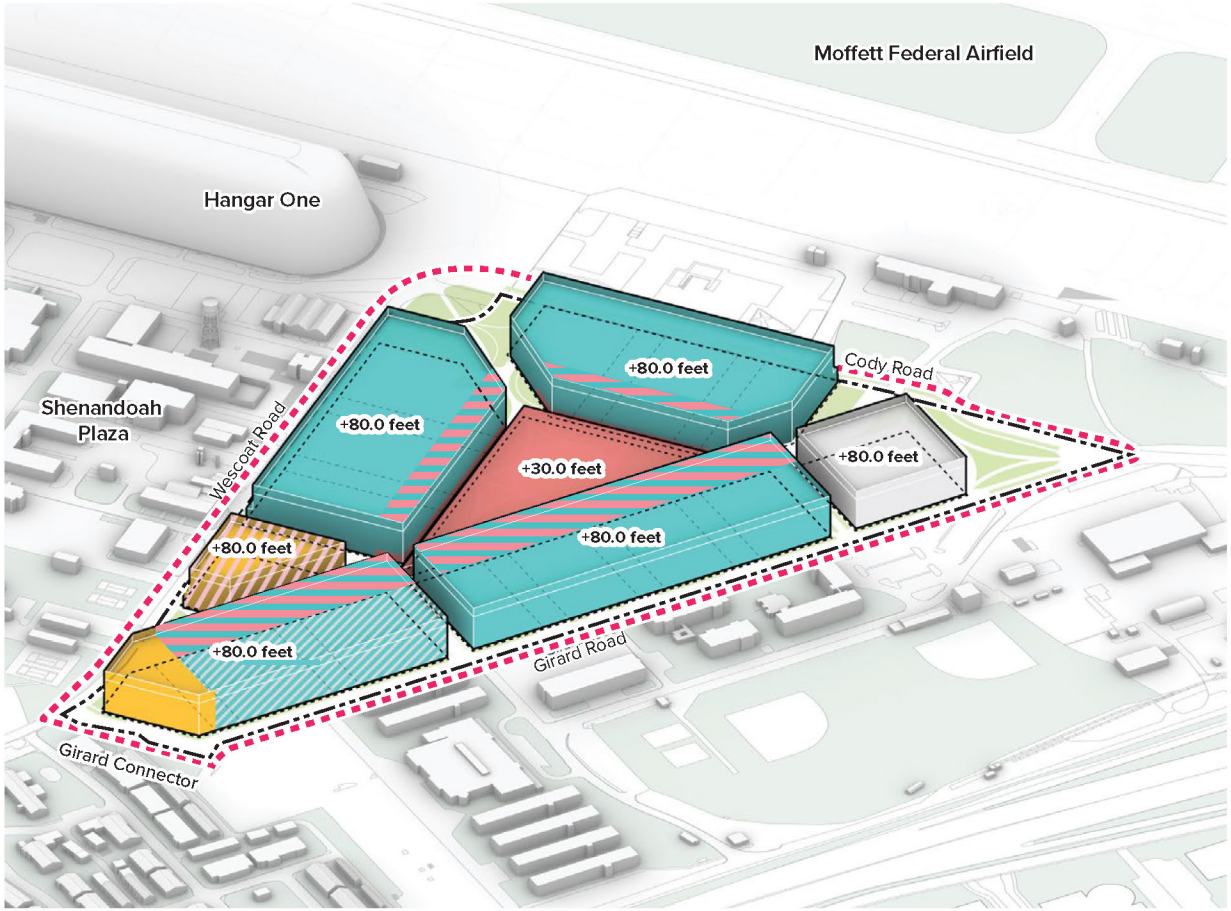
The amenity space would include a lobby, laundry facilities, mail room, bike storage room, office, meeting space, game rooms, theaters, dog wash, gym and support/back-of-the house space. Additional amenities, such as fitness centers, game rooms, shared entertainment space with shared kitchen, business center, and leasing/administrative office space could be included as part of the Student/Faculty Housing, and would not be shared with other amenity uses provided as part of the CEQA Proposed Project or CEQA Reduced Density Alternative. Parking for the Student/Faculty Housing would be provided in an adjacent garage. Furthermore, private and common outdoor open space for housing occupants would be provided on the ground and on decks, balconies, porches and roofs podium level, roof, or balconies, or a combination thereof, as described in Section 2.3.2.6, *Open Space and Landscaping*.

The CEQA Proposed Project and CEQA Reduced Density Alternative would include approximately 100 Short-Term Lodging units within Subarea 1. The Short-Term Lodging would be used as temporary lodging for staff, researchers, academics, tenants, and their families visiting the Project Site for conferences, meetings, research projects, and other short-term events. The Short-Term Lodging would provide suite-style guest rooms as well as common areas and related amenities, which could include a fitness center, game rooms, shared entertainment space, business center, and leasing/administrative office space. The Short-Term Lodging would not share amenities and active uses within the Conference Uses and with the other users of the site, including restaurant and gym/fitness center uses. However, parking would be shared with other users of the site in a shared parking garage.

2.3.2.4 Building Heights and Stepdown Zone

The CEQA Proposed Project and CEQA Reduced Density Alternative would have the same maximum building height. With respect to building heights, the primary differences between the CEQA Proposed Project and CEQA Reduced Density Alternative would be the number of internal floors and internal floor-to-floor heights. The proposed buildings would have a maximum height of

approximately 80 feet, with an exceedance of up to 25 feet (i.e., approximately 105 feet in total) allowed for mechanical screens and a limited number of minor protrusions allowed for exhaust fans and other small appurtenances, as shown in Figure 2-7, Conceptual Building Heights for the CEQA Proposed Project and CEQA Reduced Density Alternative, and Figure 2-8, Conceptual Elevations for the CEQA Proposed Project and CEQA Reduced Density Alternative. A range of internal floor-to-floor heights is allowed under the CEQA Proposed Project and CEQA Reduced Density Alternative. Typical ground floor height would range from 20 feet to 26 feet, and the typical floor height would range from 15 feet to 18 feet.



Due to the Project Site's proximity to Moffett Federal Airfield, the Project Site is within a Federal Aviation Administration (FAA) notification area and Height Restriction Area with a contour range of 157 feet above mean sea level based in National Geodetic Vertical Datum (NGVD) of 1988 to 182 feet above mean sea level based in NVGD of 1988, per the Federal Aviation Regulation Part 77, Surfaces Map, for Moffett Federal Airfield.[25] Federal Aviation Regulation Part 77, Safe, Efficient Use, and Preservation of the Navigable Airspace, establishes imaginary surfaces for airports and runways as a means of identifying areas of airspace wherein objects would be obstructions to air navigation. As such, development within the Project Site would be subject to certain height limitations pursuant to Federal Aviation Regulation Part 77.9 of the Code of Federal Regulations notification requirements, which would require consultation with the FAA prior to construction of any structure or object within Federal Aviation Regulation Part 77 surfaces. The proposed building heights would comply with FAA requirements.

Due to the Project Site's proximity to Moffett Federal Airfield, the CEQA Proposed Project and CEQA Reduced Density Alternative would be within the Santa Clara County Comprehensive Land Use Plan, Moffett Federal Airfield (Moffett CLUP), adopted in 2012 by the Santa Clara County Airport Land Use Commission. In terms of height restriction areas, the Project Site is not within an Airport Safety Zone, as defined in the Moffett CLUP.

Figure 2-9, Maximum and Minimum Development Parameters and Standards for the CEQA Proposed Project and CEQA Reduced Density Alternative, is a conceptual layout depicting the horizontal and vertical dimensions of the CEQA Proposed Project and CEQA Reduced Density Alternative based on the proposed Maximum and Minimum Development Parameters for each Subarea (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*). Because the CEQA Proposed Project and CEQA Reduced Density Alternative would not be required to be developed to reach the maximum dimensions in each Subarea, Figure 2-9 represents a conservative depiction of the conceptual layout. The proposed buildings along Wescoat Road and Cody Road would include a stepdown zone, as shown in Figure 2-9. The stepdown zone would consist of a 15-foot stepback (i.e., a recession in the building exterior) for the portions of the buildings higher than 35 feet. In addition, mechanical screens along Cody Road and Wescoat Road would be set back and restricted in height at a 45-degree angle to the 25-foot maximum mechanical screen height.

[25] Santa Clara County Airport Land Use Commission. 2012. Santa Clara County Moffett Federal Airfield Comprehensive Land Use Plan. Figure 6: Moffett Federal Airfield FAR Part 77 Surfaces. Adopted November 2, 2012; amended December 19, 2018.

Figure 2-9

Maximum and Minimum Development Parameters and Standards for the CEQA Proposed Project and CEQA Reduced Density Alternative

Berkeley Space Center at NASA Research Park

2.3.2.5 Building Design and Lighting

The CEQA Proposed Project and CEQA Reduced Density Alternative would have the same building design and lighting. The exterior design of the proposed buildings would be comprised of materials including metal panels, exposed and painted structural steel, concrete, glass curtain walls, glazing with frit inlay or colors, terracotta, aluminum frames, and plaster and natural wood. The massing, materials, and colors utilized for the proposed building design would be modulated to create a human-scaled public realm that minimizes the appearance of building bulk and mass and avoids visual clutter. In addition, mechanical equipment located on the roofs of the proposed buildings, as well as emergency generators, would be screened from view from public streets, with a limited number of minor protrusions allowed for exhaust fans and other small appurtenances.

Building façades would be designed with depth of shading members, fritted glass, and solid materials outlined in Standards set forth in the proposed Development Guidelines and will comply with California Green Building Standards Code (CALGreen) Non-Residential Voluntary Measure A5.107, *Bird-Friendly Building Design* (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*). The CALGreen measure includes design requirements related to glazing, slats, screens, netting, and louvers to minimize the risk of birds colliding with proposed buildings.[26] Furthermore, the proposed buildings within each of the Subareas would incorporate spill-out zones along the building frontages, which would include patios and terraces with seating areas that would be fully or partially covered by building articulation, trellises, or tree canopies.

Lighting throughout the Project Site would be provided for safety, security, and wayfinding purposes, and would illuminate roadways, sidewalks, and primary pathways, while minimizing light pollution. Specifically, lighting would be incorporated along the streets and sidewalks along the exterior of the Project Site along Wescoat Road, Cody Road, and Girard Road, as well as through the interior of the Project Site between the proposed buildings. In addition, primary path lighting would be provided along the Promenade and around the Central Green, with secondary path lighting being incorporated through the Central Green and Hangar Commons. Lighting fixtures incorporated throughout the Project Site would use efficient lighting technologies, including but not limited to, LED technology, and would provide lighting consistent with the minimum requirement levels by the Illumination Engineering Society of North America. In addition, lighting would be directed away from the adjacent properties by utilizing directional lighting with baffles, and non-reflective tinting on windows, among other mechanisms. Furthermore, lighting fixtures would comply with dark sky principles outlined by the International Dark-Sky Association and incorporate shielding to restrict light pollution beyond a 90-degree angle.

2.3.2.6 Open Space and Landscaping

The CEQA Proposed Project and CEQA Reduced Density Alternative would have the same amount of open space and landscaping. The CEQA Proposed Project and CEQA Reduced Density Alternative would provide a minimum of 10 acres of publicly accessible open space, including pathways, active uses (e.g., occupied areas that pedestrians could access via sidewalks or pathways), and passive uses

[26] There are several other design requirements that the project must comply with. For example, the proposed project will comply with applicable codes and regulations outlined in APD 8829.1, including, but not limited to, CCR Title 24, the National Fire Protection Association's National Fire Codes, NASA Research Park Design Review Program, and 14 CFR Part 1216, NASA Environmental Quality.

(e.g., open lawns, patios). Most of the proposed open space would be located at the center of the Project Site with additional open space in the northern, western, and eastern corners of the site.

As shown in Figure 2-5, the proposed project would include up to four open space areas, consisting of the following:

- **Central Green:** The Central Green would include a circular field at the center point of the Project Site in Subarea 7, with additional amenity seating, landscaped areas, and walkways to connect the other Subareas. The Central Green would include a loop pathway with a shaded canopy around its perimeter. The Central Green would be used for programming and events, such as corporate or academic events, demonstration or exhibition programming, picnicking and lounging, seasonal festivals, and stargazing. The Central Green would also provide stormwater collection and treatment areas.
- **Hangar Commons:** Hangar Commons would be at the northernmost portion of the Project Site between Subareas 2 and 3, across from Hangar One at the intersection of Wescoat Road and Cody Road. Hangar Commons would include seating areas with direct views to Hangar One. Hangar Commons would also serve as the location for an at-grade centralized stormwater retention basin.
- **Gateway Plaza:** The Gateway Plaza would be in the western portion of the Project Site along Wescoat Road between Subareas 1 and 6. It would include seating areas and an outdoor gathering space to serve the conference center; it would be the western starting point for the Promenade.
- **Promenade:** The Promenade would be a multi-modal, car-free connection through the Project Site in the west–east direction, from the Gateway Plaza toward Cody Road.

Seating areas and patios would be incorporated adjacent to the Promenade and around the Central Green and Hangar Commons. Furthermore, the proposed buildings within each of the Subareas would incorporate spill-out zones along building frontages. The spill-out zones would include patios and terraces with seating areas that would be fully or partially covered by building articulation, trellises, or tree canopies.

Landscaping would be incorporated throughout the Project Site and include a mix of native, climate-adaptive, and drought-resistant plant materials, along with phytoremediation-treated species (see Section 2.3.2.7, *Sustainability Features*). No invasive and/or noxious plant species would be used in project landscaping. Existing landscaping includes approximately 245 trees located throughout the Project Site. In total, implementation of the CEQA Proposed Project and CEQA Reduced Density Alternative would include removing approximately 227 trees (including up to 158 trees that would qualify as protected trees under the Santa Clara County Heritage Tree Ordinance) and planting approximately 1,283 new trees, resulting in a total of approximately 1,301 trees on the Project Site. Of the 1,283 new trees, 390 trees in a 24-inch box container would be replacement trees, which would meet the requirements of the Santa Clara County Heritage Tree Ordinance. Although tree replacement is not required, the proposed project would include implementation of the protective measures to protect trees before and during construction and avoid future loss of additional trees.[27] Of the 893 other new trees, a portion would be used for phytoremediation; the minimum number of phytoremediation trees will be determined by agreements with the EPA (see Section 2.3.3, *Remediation,* for further discussion of phytoremediation).[28]

[27] Hort Science. 2024. *Preliminary Arborist Report: Ames Research Center, Mountain View (Santa Clara County), CA.* September 2024. The report is included in Attachment C to Appendix 3.14-1 of this joint EIR/EIS.

[28] *Phytoremediation* uses plants to remediate contaminated environments.

Streetscape Improvements

As part of the CEQA Proposed Project and CEQA Reduced Density Alternative, certain streetscape and associated landscape improvements would be constructed adjacent to building frontages and within the Project Site. The streetscape and landscape improvements for the CEQA Proposed Project and CEQA Reduced Density Alternative would include landscaping, tree planting, sidewalk, bike lane, loading zone, and lighting and street furniture installations along Wescoat Road, Cody Road, and Girard Road.

Temporary Programming and Events

Temporary programming and events in the Central Green would consist of approximately one event per month (i.e., approximately 12 events per year) that may use amplified sound.

2.3.2.7 Sustainability Features

The CEQA Proposed Project and CEQA Reduced Density Alternative would incorporate various sustainability strategies for both the proposed buildings and landscaping to reduce energy consumption, water consumption, and waste generation. The CEQA Proposed Project and CEQA Reduced Density Alternative would achieve, at a minimum, a Leadership in Energy and Environmental Design (LEED) Silver rating. The proposed sustainability design responds to the climate and context by optimizing thermal comfort through passive cooling, providing windbreaks, prioritizing daylight within floor plates of the buildings and outdoor spaces, and providing a variety of courtyards and amenity terraces and patios.

In addition, the CEQA Proposed Project and the CEQA Reduced Density Alternative would include the construction and operation of photovoltaic (PV) systems to generate on-site renewable energy and battery energy storage systems that meet or exceed minimum Energy Code compliance requirements through prescriptive or performance based design provided in the proposed Development Guidelines. The PV systems would be installed on the roofs of the proposed buildings. The PV systems would connect to the battery energy storage systems. Based on the current prescriptive Energy Code requirements, an initial estimate of the battery energy storage system energy is approximately 733-kilowatts. Preliminary plans indicate that individual battery energy storage systems would range in size (i.e., storage capacity) from approximately 6 kilowatt hours (kWh) to 940 kWh. The battery energy storage system would be distributed throughout the buildings within each Subarea.

All new building systems (e.g., heating, ventilation, air-conditioning [HVAC], mechanical systems) would be supplied with electricity, eliminating the need for connections to Pacific Gas & Electric's (PG&E) natural gas infrastructure for building operations. However, gases (e.g., oxygen, carbon dioxide [CO_2], nitrogen, clean dry air, natural gas) may be used by tenants for research purposes in laboratories within the Research and Office Uses. The proposed laboratories would be supported through gas tanks, either within the laboratories, or at a central location within a building, or located in working yards.

The CEQA Proposed Project and CEQA Reduced Density Alternative would incorporate potable water conservation features within buildings (e.g., low-flow fixtures for indoor water use, dual plumbing to allow recycled water usage for flushing), a drip irrigation system, and drought-friendly and ecologically appropriate plantings. The CEQA Proposed Project and CEQA Reduced Density Alternative would also be designed to conserve resources and protect water quality through the management of

stormwater runoff using low-impact development (LID) methods, where feasible. To treat stormwater discharges from the Project Site, the CEQA Proposed Project and CEQA Reduced Density Alternative would incorporate a variety of stormwater treatment methods, including bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, Silva Cells, and a centralized stormwater retention basin.

The proposed design elements (e.g., pedestrian circulation improvements, bicycle circulation improvements and bicycle parking, transportation demand management [TDM] measures) would encourage alternative forms of transportation. As discussed under the *Transportation Demand Management* subheading in Section 2.3.5, *Transportation and Circulation*, the CEQA Proposed Project and CEQA Reduced Density Alternative would include a project-specific TDM plan to reduce the vehicle trips and associated vehicle miles traveled (VMT) generated by the proposed project. The majority of the Project Site is within 0.50 mile of the Bayshore/NASA VTA light rail station and the Project Site is within walking and biking distance of the station. In addition, the proposed project would follow the most current CALGreen code requirements. Approximately 10 percent of the total number of parking spaces (i.e., approximately 342 spaces under CEQA Proposed Project and approximately 206 spaces under the CEQA Reduced Density Alternative) would be electric-vehicle (EV) capable to accommodate the future installation of EV chargers.

For construction and demolition, 50 percent of all inert solids (i.e., building materials) and 50 percent of non-inert solids (i.e., all other materials) would be recycled.

2.3.2.8 Occupancy

Student/Faculty Housing and Short-Term Lodging

The CEQA Proposed Project and CEQA Reduced Density Alternative would include the same number of Student/Faculty Housing units and Short-Term Lodging units; thus, the on-site population for these uses would be the same, as shown in Table 2-8. The CEQA Proposed Project and CEQA Reduced Density Alternative would result in approximately 200 Short-Term Lodging guests and approximately 363 Student/Faculty Housing residents, for a total of approximately 563 Short-Term Lodging guests and residents.

Table 2-8. Proposed Guests and Residents for the CEQA Proposed Project and CEQA Reduced Density Alternative

	Proposed Units	Generation Rate	Guests/Residents
Existing			
Existing Residents on the Project Site	—	—	0
Proposed Project			
Short-Term Lodging Guests	100 units	2 occupants/unit	200
Student/Faculty Housing Residents	145 units	2.5 occupants/unit[a]	363
Total Net New Guests and Residents	—	—	***563***

Source: Proposed Berkeley Space Center Master Plan, Spring 2026. See Appendix 2-1 of this joint EIR/EIS.
Note:

a. The average of 2.5 occupants per unit is based on the following calculation: (2 occupants per studio × 25 percent) + (2 occupants per one-bedroom unit × 25 percent) + (3 occupants per two-bedroom unit × 50 percent)/100 percent.

Research and Office, Conference Center, and Active Uses

The CEQA Proposed Project would result in more employees and students than the CEQA Reduced Density Alternative because the CEQA Proposed Project would include more square footage for Research and Office Uses and more space for academic uses, as shown in Table 2-9. The CEQA Proposed Project and CEQA Reduced Density Alternative would include the same amount of square footage for Conference Uses and Active Uses; thus, the on-site population for these uses would be the same, as shown in Table 2-9. Accounting for the 42 existing employees who would no longer work at the Project Site or NASA ARC with implementation of the proposed project, the CEQA Proposed Project would result in approximately 6,132 employees and students, whereas the CEQA Reduced Density Alternative would result in approximately 3,384 employees and students.

2.3.3 Remediation

No remediation activities are included as part of the CEQA Proposed Project or CEQA Reduced Density Alternative. The Project Proponent is working with EPA, the RWQCB, San Francisco Bay Regional Water Quality Control Board Regional Water Board (Regional Water Board), and NASA on an Environmental Issues Management Plan (EIMP). The Spring 2026 project-specific EIMP is currently under review by the EPA and San Francisco Bay Regional Water Quality Control Board, the regulatory agencies that will approve of the Spring 2026 project-specific EIMP. NASA has previously reviewed and provided comments on the Spring 2026 project-specific EIMP. Appendix 2-2 of this joint EIR/EIS includes the Spring 2026 project-specific EIMP.

Implementation of the Spring 2026 project-specific EIMP is required for project implementation and is included in this joint EIR/EIS as a mitigation measure. Prior to commencement of construction of the proposed project, the EPA and the Regional Water Board will review and approve the Spring 2026 project-specific EIMP. The Spring 2026 project-specific EIMP will also be periodically reviewed and any necessary updates or addenda to the Spring 2026 project-specific EIMP will be reviewed by NASA and submitted to the EPA and Regional Water Board for approval.

The implementation of the Spring 2026 project-specific EIMP by the Project Proponent is not intended to relieve the Responsible Parties of their responsibilities and ongoing obligations. Rather, the Spring 2026 project-specific EIMP allocates as between NASA and the Project Proponent who will take actions to address environmental conditions in the event of non-performance or delayed performance by another Responsible Party, but such actions will not result in Project Proponent (including tenants and project developers) becoming a Responsible Party.

The Spring 2026 project-specific EIMP builds upon the prior 2005 NRP EIMP (and a subsequent 2007 Addendum); the 2005 NRP EIMP does not apply to the proposed project. The Spring 2026 project-specific EIMP has been updated to reflect current regulatory requirements[29] and includes more detailed procedures specific to the Project Site. A Settlement Agreement and Covenant Not to Sue (currently in draft form) is being entered into between the Project Proponent, Moffett Partners, LLC, and the United States Department of Justice and United States Environmental Protection Agency Region 9 (Covenant Not to Sue), with respect to the Project Site. The Covenant Not to Sue provides the Project Proponent with certain liability relief in consideration of a monetary payment, a phytoremediation project, and implementation of the Spring 2026 project-specific EIMP within the Limits of Work.

[29] The Spring 2026 project-specific EIMP: (a) provides an updated description of exposure pathways, (b) discusses soil and groundwater TCLs provided in the 2005 NRP EIMP, (c) provides updated TCLs for groundwater and soil, and (d) provides TCLs for indoor air, soil vapor, and sub-slab vapor.

Table 2-9. Proposed Employees and Students under the CEQA Proposed Project and CEQA Reduced Density Alternative

	CEQA Proposed Project (NEPA Build Alternative 1)			CEQA Reduced Density Alternative (NEPA Build Alternative 2)		
	Proposed Land Use (sf)	**Generation Rate**	**Employees**	**Proposed Land Use (sf)**	**Generation Rate**	**Employees**
Existing						
Existing Employees or Tenants on the Project Site	—	—	42	—	—	42
Proposed Project						
Research and Office Uses						
Office	350,000	279 sf/ employee	1,254	190,000	279 sf/ employee	681
Laboratory and R&D	1,390,000	405 sf/ employee	3,432	750,000	405 sf/ employee	1,852
Academic	260,000	234 sf/ employee	1,111	140,000	234 sf/ employee	598
Conference Uses	25,000 (20 rooms)	1 employee per room	20	Same as CEQA Proposed Project	1 employee per room	20
Active Uses	90,000	500 sf/ employee	180	Same as CEQA Proposed Project	500 sf/ employee	180
Total Proposed Employees	—	—	*5,997*	—	—	*3,331*
Total Proposed Students (based on academic square footage)	260,000	0.00068 sf/ student	*177*	140,000	0.00068 sf/ student	*95*
Total Net New Employees and Students (accounting for the existing employees who would no longer work at the Project Site with implementation of the proposed project)	—	—	***6,132***	—	—	***3,384***

Source: Proposed Berkeley Space Center Master Plan, Spring 2026. See Appendix 2-1 of this joint EIR/EIS.
Note: sf = square feet

The purpose of the Spring 2026 project-specific EIMP is to provide a decision framework for the management of residual chemicals in soil, groundwater, and existing and future structures within the Project Site during construction and operation of the CEQA Proposed Project or CEQA Reduced Density Alternative. The Spring 2026 project-specific EIMP includes required procedures that must be followed to address the known remaining environmental conditions within the Project Site as well as contingency actions to be taken in the event that previously unknown environmental conditions are encountered during development of the CEQA Proposed Project or CEQA Reduced Density Alternative.

The CEQA Proposed Project and CEQA Reduced Density Alternative would incorporate landscaping that would allow the inclusion of phytoremediation strategies to improve soil and groundwater quality (see Section 2.2.2, *Existing Conditions*). The CEQA Proposed Project and CEQA Reduced Density Alternative would include planting phytoremediation bands along Girard Road to intersect the flow of the existing contamination and incorporating phytoremediation species, such as poplar, willow, and cottonwood trees, into the overall landscape design.

Where potential conflicts between the CEQA Proposed Project or CEQA Reduced Density Alternative and the location of existing remediation system components and/or groundwater monitoring wells occur, these conflicts will be identified and resolved during the design stage at each phase of the proposed project. Relocation or removal of any remediation system components may occur only with the prior approval of EPA and the California RWQCB, San Francisco Bay Region. Design and implementation of any changes to the remediation system could include properly sealing groundwater wells designated to be closed, installing and developing any replacement groundwater wells, and installing and connecting any rerouted pipelines or other system components that need to be relocated.

Specifically, the Spring 2026 project-specific EIMP identifies measures to reduce potential exposure to VOCs in indoor air and groundwater movement, including the installation of a vapor barrier and sub-slab ventilation system into new buildings and the use of low-permeability backfill or cutoff walls to reduce potential contaminant migration during utility work or trenching. The Spring 2026 project-specific EIMP also includes risk management measures to be implemented during project construction, which include, but are not limited to, the development and implementation of a site-specific Health and Safety Plan,[30] dust and odor control measures, and procedures for the proper management of dewatering water, hazardous building materials, and abandoned underground storage tanks encountered during project construction.

2.3.4 Construction

The CEQA Proposed Project and CEQA Reduced Density Alternative would include the same demolition, ground disturbance and excavation, schedule and phasing, haul route, construction equipment, and construction hours. Less square footage would need to be constructed in each building under the CEQA Reduced Density Alternative; thus, the duration of some construction subphases would be reduced under the CEQA Reduced Density Alternative compared to the CEQA Proposed Project. The CEQA Proposed Project and CEQA Reduced Density Alternative would include a construction traffic control plan for each phase of the proposed project to address construction

[30] A health and safety plan describes health and safety training requirements for on-site workers, personal protective equipment to be used, and other precautions to be undertaken to minimize direct contact with soil, groundwater, and soil vapors.

traffic on regional and local roads in the vicinity of the Project Site. Appendix 2-3 of this joint EIR/EIS includes the temporary traffic control procedures, which establish required procedures for temporary traffic control during construction pursuant to APR 8715.1, Chapter 27, Section 27.8, Temporary Traffic Disruption.

2.3.4.1 Demolition

All existing buildings, building slabs, pavement sections, utility infrastructure, sidewalks, and other hardscape would be demolished, except for existing underground NASA critical infrastructure, which would remain. The portion of an existing below-grade steam tunnel under Cody Road within the Project Site would also be demolished; the portion of the steam tunnel outside the Project Site would remain. A total of approximately 369,000 square feet of building area and paving would be demolished. It is anticipated that approximately 19,600 cubic yards (cy) of demolition materials (including buildings, building foundations, roads, pavement, cleared and grubbed material, steam tunnel, and contaminated soil) would be transported off-site for disposal and approximately 11,600 cy of demolition materials would be recycled to be used as fill at the Project Site. The CEQA Proposed Project and CEQA Reduced Density Alternative would be required to comply with the procedures and contingency actions described in the Spring 2026 project-specific EIMP, including those related to contaminated soil, ACM, LBP, and PCB, as discussed in Section 2.3.3, *Remediation*.

2.3.4.2 Ground Disturbance and Excavation

The proposed grading would follow the existing drainage pattern, flowing south to north. The south-to-north slope pattern would be maintained with a general 0.8 percent slope across the Project Site. The CEQA Proposed Project and CEQA Reduced Density Alternative would result in approximately 45 acres of ground disturbance during construction, inclusive of the Project Site and Off-Site Areas. Construction activities would comply with the National Pollutant Discharge Elimination System (NPDES) Construction General Permit and the Municipal Regional Permit. As part of the Construction General Permit, standard erosion control measures and best management practices (BMPs) would be identified in a Storm Water Pollution Prevention Plan (SWPPP) and implemented during construction to reduce sedimentation in waterways and loss of topsoil.

The Project Proponent proposes to use recycled materials from demolition activities and spoils generated from excavation activities on-site. If additional soil is required for the CEQA Proposed Project or CEQA Reduced Density Alternative, soil would be imported. All imported soil would be certified clean with supporting documentation per Department of Toxic Substances Control (DTSC) fill guidance (California Environmental Protection Agency [CalEPA] 2001; CalEPA 2006), thereby eliminating the risk of import of contaminated soil onto the Project Site. Between the import required to restore the Project Site's existing grade (approximately 13,000 cy), the recycled material to be used as fill (approximately 11,600 cy), and the spoils generated from grading activities (approximately 105,500 cy), a total of approximately 104,100 cy of net soil export would be generated. However, to avoid this amount of export, the Project Site would be raised above existing grade. Along the south side of the Project Site, between 0.5 and 5 feet of fill would be placed. Because the Project Site would need to conform to the existing grade along the west, north, and east sides of the site, a small amount of fill (between 0 and 1 foot) would be placed. Most of the fill would be placed in the center and the southern portions of the Project Site, ranging from 0.5 to 2 feet near the northern edge and 2 to 6 feet near the southern edge. For the purposes of this joint EIR/EIS, it is assumed that the Project Site would be raised above the existing grade on the south side. Table 2-10

summarizes the cut, fill, recycled material, and import quantities for the CEQA Proposed Project and CEQA Reduced Density Alternative. The CEQA Proposed Project and CEQA Reduced Density Alternative would be required to comply with the procedures and contingency actions described in the Spring 2026 project-specific EIMP, including those related to the evaluation and disposal of contaminated soil and/or water, as discussed in Section 2.3.3, *Remediation*.

Table 2-10. Estimated Proposed Soil Spoils, Fill, and Import Quantities for the CEQA Proposed Project and CEQA Reduced Density Alternative

	Estimated Quantity (cubic yards)
Cut	-3,303
Fill	107,903
On-Site Soil Deficit to Meet Fill Needs without Recycled Spoils	*104,600*
Recycled Spoils Generated On-Site	-104,100
Net Soil Import	***500***

Source: BKF. 2026. *Berkeley Space Center, Moffett Field, NASA Research Park, Grading and Overland Release Master Plan.* 2026.

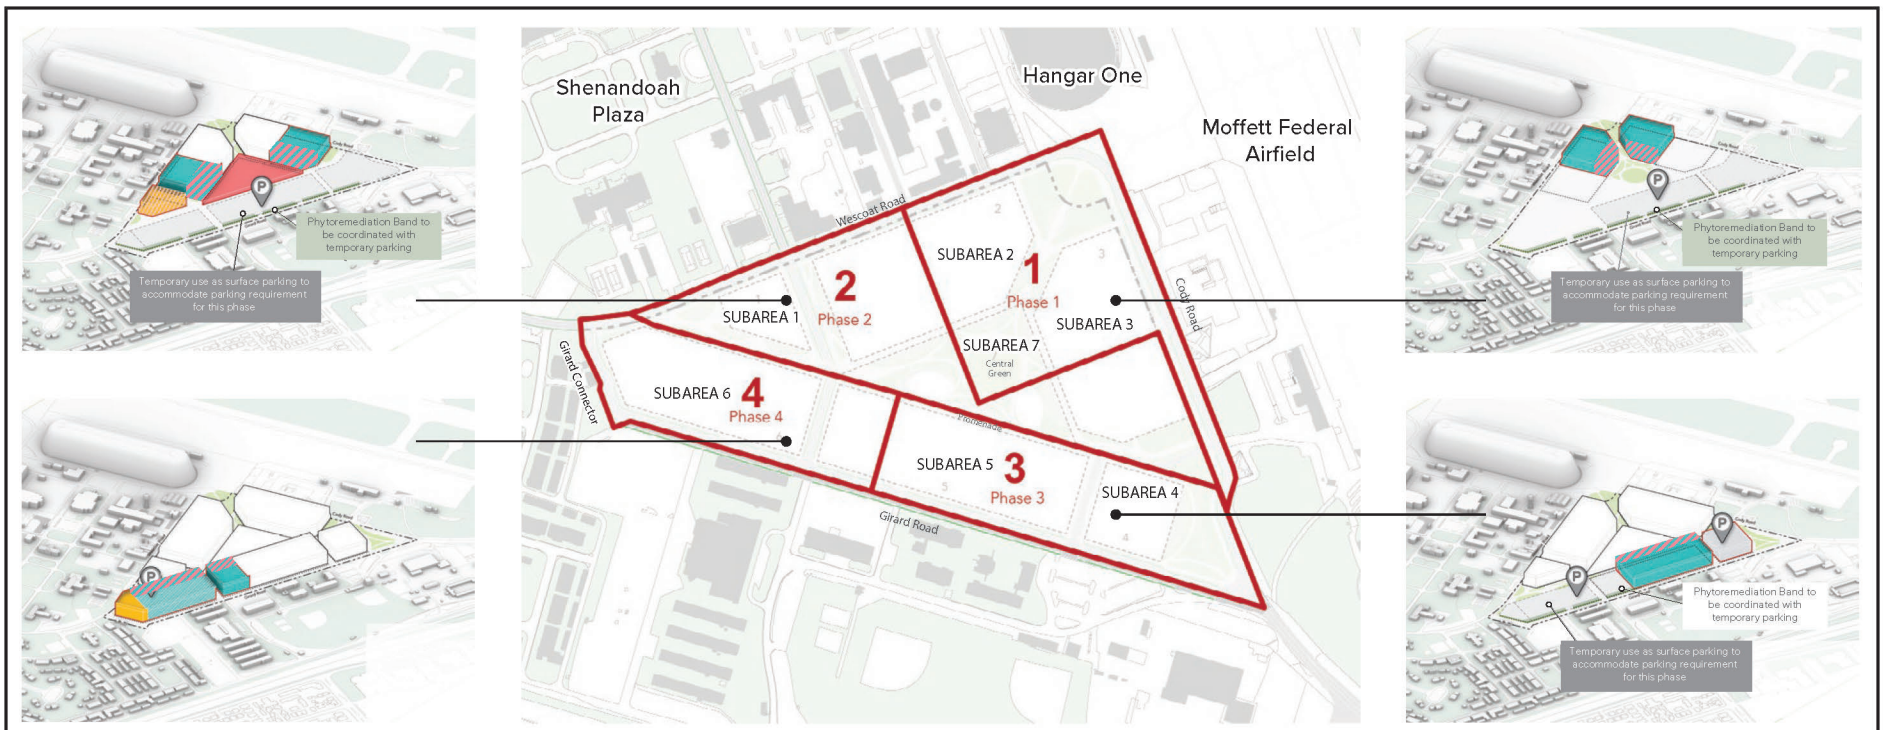
The maximum depth of excavation associated with construction of the CEQA Proposed Project and CEQA Reduced Density Alternative would be as follows:

- Approximately 1 foot below ground surface (bgs) for building demolition (including the off-site building demolition discussed in Section 2.3.7, *Off-Site Utility Improvements and Demolition)*
- Approximately 1 to 2 feet bgs for roads
- Approximately 1 to 4 feet bgs for open space and landscaping
- Approximately 3 to 4 feet bgs for typical utility improvements (including the off-site utility improvements discussed in Section 2.3.7, *Off-Site Utility Improvements and Demolition*)
- Approximately 5 feet bgs for building foundations
- Approximately 11 feet bgs for the distribution pipes under the CUP Option for the CEQA Proposed Project (discussed in Section 2.3.6.8, *Heating, Ventilation, and Air Conditioning Systems*, under the *CEQA Proposed Project with the Central Utility Plant Option* subheading)
- Approximately 12 feet bgs for the demolition of the steam tunnel discussed in Section 2.3.4.1, *Demolition*
- Approximately 25 feet bgs for the below-grade sewer lift station (in the southwest corner of the Project Site, near Girard Road and the Girard Connector, as discussed in Section 2.3.6.3, *Wastewater*, under the *Wastewater Main Connection Options* subheading)

Temporary construction dewatering may be required in some isolated areas of the Project Site to address the effects of shallow groundwater. Consistent with the requirements of the Spring 2026 project-specific EIMP, groundwater produced during dewatering from construction activities would be sampled for laboratory analysis and may be used for dust control within the Project Site with NASA approval and if chemical of potential concern concentrations are below target concentration levels. If use of groundwater from dewatering activities for dust control is not possible, groundwater would be transported to one of the nearby existing or future groundwater treatment systems operated by the Responsible Parties for disposal, with approval of the relevant Responsible Party (depending on the area in which the excavation occurs and the chemicals of potential concern

detected in groundwater). To the extent that use for dust control or disposal using one of the groundwater systems is not possible, the Project Proponent could discharge groundwater produced during dewatering to the sanitary sewer if a discharge permit can be obtained. If groundwater from dewatering activities is unable to be disposed of by one of the options listed previously, the Project Proponent would be required to arrange for the treatment and/or disposal of the water at a permitted off-site facility.

2.3.4.3 Schedule and Phasing



Construction is anticipated to begin in 2027 and be completed by 2040; full project occupancy is anticipated to occur in 2041. The CEQA Proposed Project and CEQA Reduced Density Alternative would be constructed in four phases, as shown in Figure 2-10, Conceptual Construction Phasing Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative. Each phase of construction would include some or all of the following subphases: demolition, site preparation and grading, building, utility and road, parking structure, and surface parking. Some subphases (e.g., site preparation) would occur concurrently and others would advance sequentially. Less square footage would need to be constructed in each building under the CEQA Reduced Density Alternative; thus, the duration of some construction sub-phases would be reduced under the CEQA Reduced Density Alternative compared to the CEQA Proposed Project. Specifically, under the CEQA Reduced Density Alternative, the duration of the "core and shell" and "architectural coating" subphases for research buildings would be reduced by 2 months and 1 month, respectively, relative to the CEQA Proposed Project. However, the overall buildout schedule would be the same under the CEQA Proposed Project and CEQA Reduced Density Alternative. Buildings within each phase would be occupied immediately following completion of each phase. Appendix A of the *Berkeley Space Center at NASA Research Park Air Quality, Health Risk Assessment, and Greenhouse Gas Technical Report* in Appendix 3.3-1 of this joint EIR/EIS includes further details regarding the construction assumptions for the proposed project.

During each phase, the entire construction site area for that phase would be fenced to control pedestrian and vehicular entry, except at controlled (i.e., gated) points. The construction fencing would remain locked during non-construction hours.

Phase 1

Demolition of existing on-site structures, surface asphalt, and a below-grade steam tunnel would occur in the northern portion of the Project Site (within portions of Subareas 2, 3, and 7) during Phase 1. In addition, demolition of existing Building 543 in the Off-Site Areas south of the Project Site could occur as early as Phase 1. Construction activities during Phase 1 would also occur in the northern portion of the Project Site. Temporary surface parking would be located in Subareas 4 and 5. Phase 1 would include the relocation of Cody Road and construction of a portion of the Research and Office Uses, Active Uses, and a portion of the Central Green. Only the CEQA Proposed Project includes the WRF Option (see Section 2.3.6.2, *Recycled Water*); construction of the first phase of the WRF Option would occur at the end of Phase 1. In addition, Phase 1 would include the construction of some of the utility improvements in the Off-Site Areas. During Phase 1, the demolition subphase would occur over approximately 7 months, the site preparation and grading subphases would occur over 12 months, the building subphases would occur over 48 months, the utility and road subphases would occur over 30 months, and the surface parking subphases would occur over 12 months. Construction of Phase 1 is anticipated to occur over 54 months, with first occupancy of Phase 1 in 2032.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

Note: Images are conceptual until after project approval. The proposed project would include utility improvements and building demolition outside of the Project Site, but within the Limits of Work; the Limits of Work are depicted on Figure 2-2.

Source: Project Proponent 2024.

Figure 2-10
Conceptual Construction Phasing Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative
Berkeley Space Center at NASA Research Park

Phase 2

Demolition of existing on-site structures and surface asphalt would occur in the western and eastern portions of the Project Site (within Subarea 1 and portions of Subareas 2, 3, and 7) during Phase 2. Construction activities during Phase 2 would also occur in the western and eastern portions of the Project Site. Temporary surface parking would be located in Subareas 4, 5 and 6. Phase 2 would include the construction of a portion of the Research and Office Uses, Conference Uses, the Short-Term Lodging, and the ground-floor Active Uses in the Central Green. In addition, Phase 2 would include the construction of some of the utility improvements in the Off-Site Areas. During Phase 2, the demolition subphase would occur over approximately 3 months, the site preparation and grading subphases would occur over 12 months, the building subphases would occur over 38 months, the utility and road subphases would occur over 18 months, and the surface parking subphase would occur over 10 months. Construction of Phase 2 is anticipated to occur over 42 months, with first occupancy of Phase 2 in 2035.

Phase 3

Demolition of on-site existing structures and surface asphalt would occur in the eastern and southern portions of the Project Site (within Subarea 4 and a portion of Subarea 5) during Phase 3. In addition, demolition of existing Buildings 583A, 583C, 547E, and 944 in the Off-Site Areas south of the Project Site could occur as early as Phase 1. Construction activities during Phase 3 would also occur in the eastern and southern portions of the Project Site. Temporary surface parking would be located in Subareas 5 and 6. Phase 3 would include construction of a portion of the Research and Office Uses and Active Uses and also a parking garage. Phase 3 would also include demolition of some temporary surface parking. In addition, Girard Road would be built out from Cody Road to Dailey Road. Only the CEQA Proposed Project includes the CUP Option (see Section 2.3.6.8, *Heating, Ventilation, and Air-Conditioning Systems*); construction of the CUP Option would occur during Phase 3. Only the CEQA Proposed Project includes the WRF Option (see Section 2.3.6.2, *Recycled Water*); construction of the second phase of the WRF Option would occur at the end of Phase 3. In addition, Phase 3 would include the construction of some of the utility improvements in the Off-Site Areas. During Phase 3, the demolition subphase would occur over approximately 3 months, the site preparation and grading subphases would occur over 12 months, the demolition subphase would occur over 3 months, the building subphases would occur over 38 months, the utility and road subphases would occur over 19 months, the parking structure subphases would occur over 28 months, and the surface parking subphases would occur over 10 months. Construction of Phase 3 is anticipated to occur over 42 months, with first occupancy of Phase 3 in 2038.

Phase 4

Demolition of existing on-site structures and surface asphalt would occur in the southern and western portions of the Project Site (within Subarea 6 and portions of Subareas 5) during Phase 4. Phase 4 would also include demolition of the remaining temporary surface parking. Construction activities during Phase 4 also occur in the southern and western portions of the Project Site. Phase 4 would include construction of the remainder of a portion of the Research and Office Uses, the Student/Faculty Housing units, and a parking garage. In addition, Phase 4 would include the construction of some of the utility improvements in the Off-Site Areas, including Girard Connector to Wescoat Road. During Phase 4, the demolition subphase would occur over approximately 3 months, the site preparation and grading subphases would occur over 12 months, the demolition subphase

would occur over 3 months, the building subphases would occur over 32 months, and the parking structure subphases would occur over 23 months. Construction of Phase 4 is anticipated to occur over 42 months, with first occupancy of Phase 4 by 2041.

2.3.4.4 Haul Route

The haul route for demolition materials would be U.S. 101. Trucks traveling to the Project Site would exit U.S. 101 at Ellis Street, go through the applicable access control points along Ellis Street, and continue to the Project Site via Cody Road. Trucks traveling from the Project Site would exit the Project Site via Cody Road, then continue to Ellis Street and through the applicable access control points and onto the U.S. 101 on-ramp. The haul route is not anticipated to change under Open Campus conditions, which are discussed under the *Open Campus* subheading in Section 2.3.5, *Transportation and Circulation*. Appendix 2-3 of this joint EIR/EIS includes the temporary traffic control procedures, which establish required procedures for temporary traffic control during construction pursuant to APR 8715.1, Chapter 27, Section 27.8, Temporary Traffic Disruption. The temporary traffic control procedures will address haul routes.

2.3.4.5 Construction Equipment and Worker Parking

Typical equipment would be used during construction of the CEQA Proposed Project or CEQA Reduced Density Alternative. This could include, but would not be limited to, an excavator, crawler tractor, mini excavator, concrete saw, rubber-tired dozer, tractor, loader, backhoe, generator, plate compactors, tower crane, trawler crane, man and material lift, aerial lift, welder, air compressor, rough fork lift, scissor lift, paver, grader, roller, and bobcat. Driven piles are not included as part of the proposed project. The proposed project may include piles installed through other construction methods.

All staging of construction equipment is expected to be on-site for Phases 1 to 3. Construction worker parking would also be on-site for Phases 1 to 4. Staging of construction equipment during portions of Phase 4 could be off-site at existing paved areas adjacent to the Project Site (to the south or east) but within NASA ARC areas that would be suitable for construction material.[31]

2.3.4.6 Construction Hours

Most construction would occur from 7:00 a.m. to 7:00 p.m. Pacific Time on weekdays. Limited nighttime or weekend construction could be required for concrete pours and off-site construction in roadways for utility installation.

The range of construction activity in the early morning hours would vary, but concrete pours are anticipated during each construction phase. In general, approximately five individual nights of construction would be required per building for concrete pours. In some instances, nighttime concrete pours could occur on back-to-back nights. However, the concrete pours would be limited in number and would generally occur months apart from each other. Off-site utility work may occur outside of normal business hours and on weekends, per NASA requirements. It is anticipated that nighttime or weekend construction could be required in limited instances for concrete pours and

[31] The use of areas adjacent to the Project Site (i.e., to the south or east) within NASA ARC would be contingent on subsequent NASA review and approval of those areas for use. If the use of areas adjacent to the Project Site for construction staging is not approved by NASA, staging of construction equipment during Phase 4 would be on-site.

utility work. In general, this would include approximately 5 days of nighttime construction per building for concrete foundation pours and approximately 10 days of nighttime construction per utility system. Low-level safety lighting may be needed for construction site security. However, the safety lighting would be temporary.

2.3.5 Transportation and Circulation

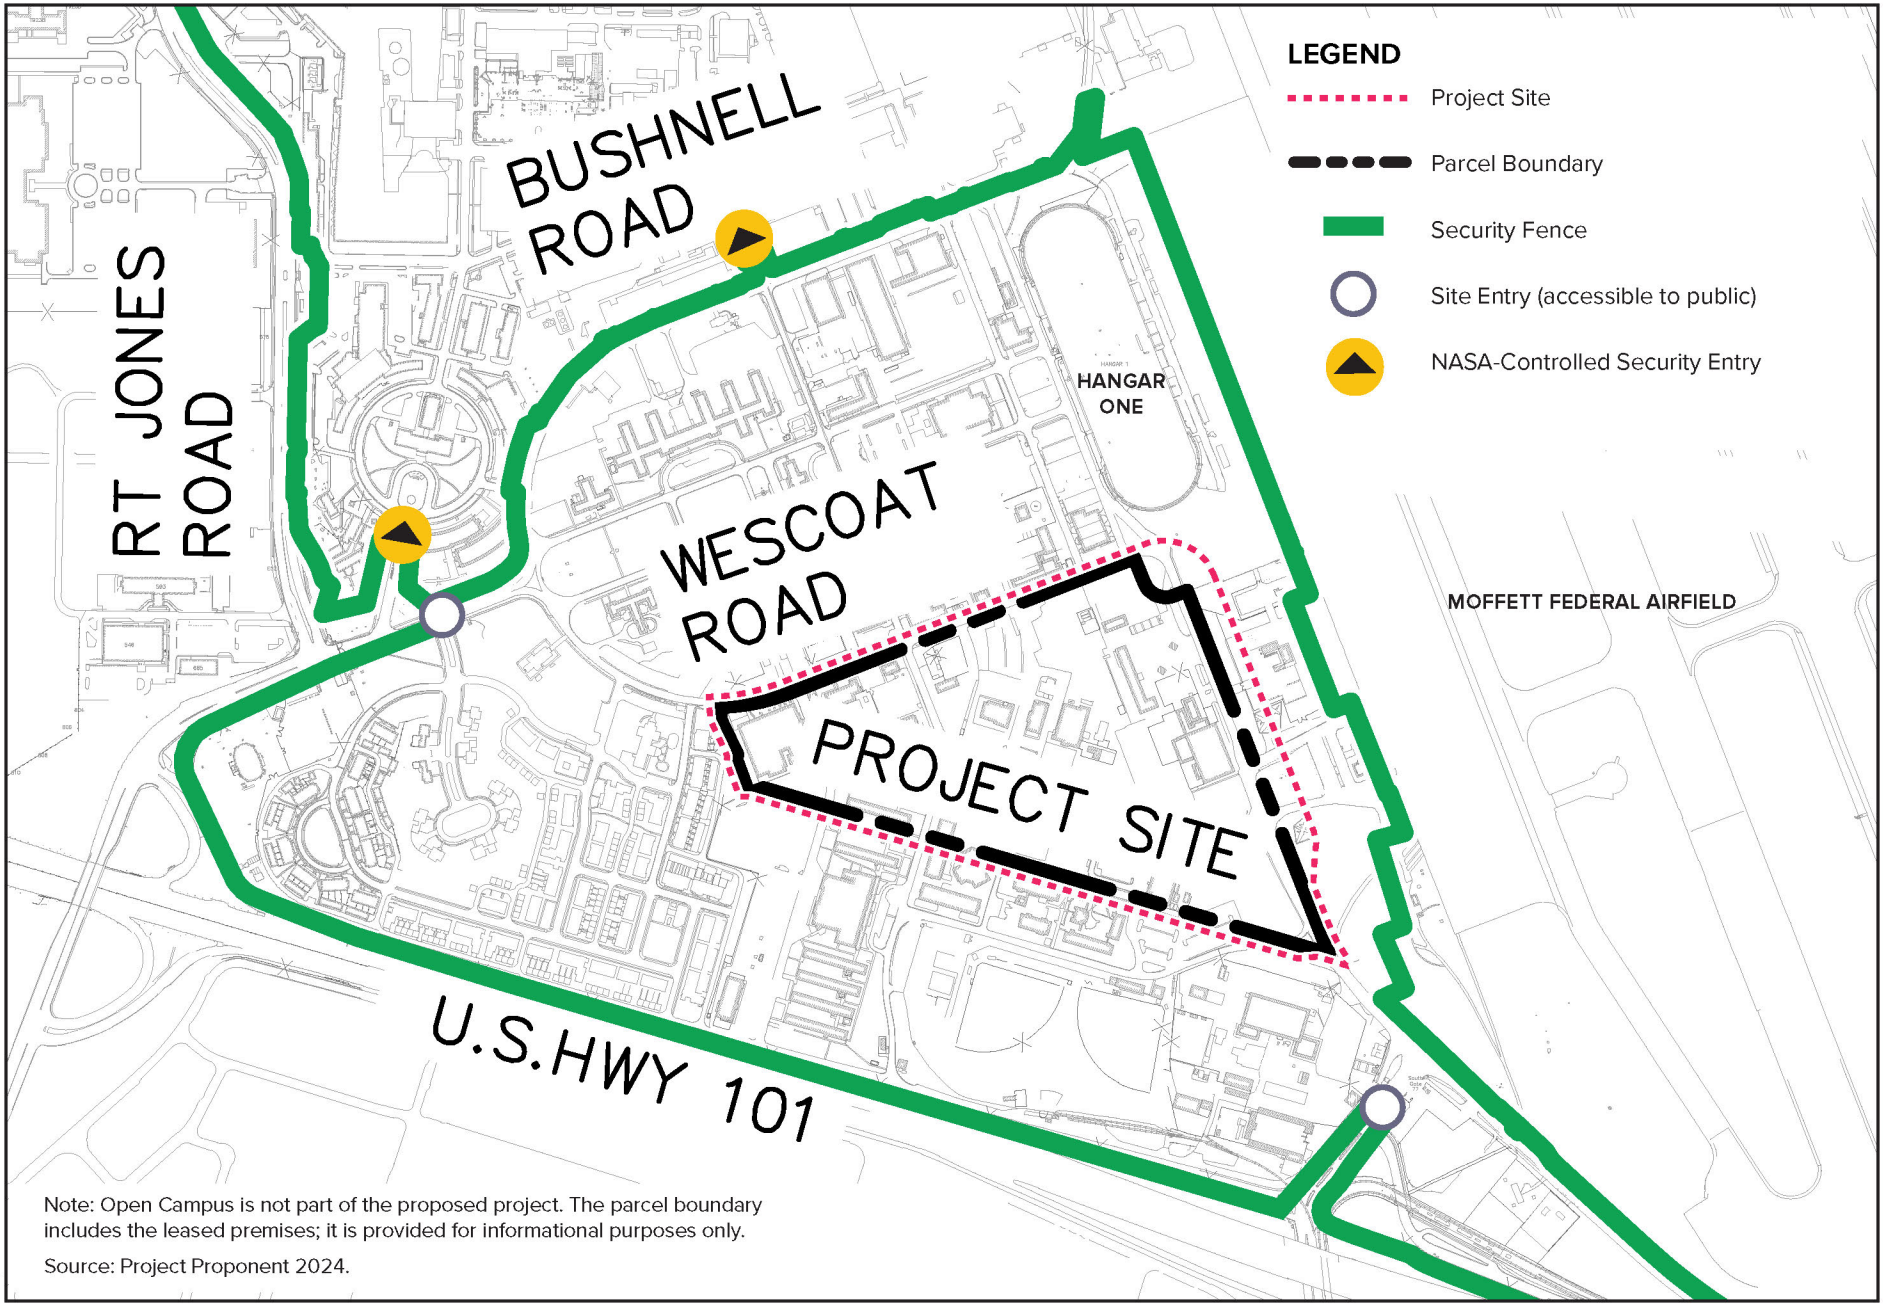
2.3.5.1 Open Campus

Public access to the Project Site under existing conditions is controlled by a perimeter fence, as well as security and visitor checkpoints located at the main gate on Clark Road and the gate located on Ellis Street. By Phase 1 occupancy, NASA anticipates operational modifications to allow a free flow of traffic at these two checkpoints, as shown in Figure 2-11, Open Campus. No physical improvements are required for these operational modifications, which are referred to as "Open Campus," and are not part of the CEQA Proposed Project or CEQA Reduced Density Alternative. For the purposes of the analysis in this joint EIR/EIS, to account for Open Campus conditions, the following describes the baseline conditions:

- The baseline for the Phase 1 construction analysis (i.e., project-related activities before Phase 1 occupancy) is a typical existing-conditions baseline scenario because Open Campus improvements would not be completed yet.
- The baseline for all operational analyses and Phases 2 to 4 construction analyses is a future baseline scenario that accounts for Open Campus improvements.

2.3.5.2 Site Access

With implementation of the CEQA Proposed Project or CEQA Reduced Density Alternative, the Project Site would be bounded by Wescoat Road, Cody Road, and Girard Road. These roadways would provide site access and access to other areas of the NRP, Eastside/Airfield, and Ames Campus. In addition, Cody Road connects to Ellis Street, which provides direct access to U.S. 101, as shown in Figure 2-1. As discussed below, the Project Site is connected to the surrounding roadway network, which serves vehicles, emergency vehicles, pedestrians, and bicyclists. Construction detours may be implemented as needed to maintain access to and around the Project Site. The CEQA Proposed Project and CEQA Reduced Density Alternative would include a construction traffic control plan for each construction phase. Appendix 2-3 of this joint EIR/EIS includes the temporary traffic control procedures, which establish required procedures for temporary traffic control during construction pursuant to APR 8715.1, Chapter 27, Section 27.8, Temporary Traffic Disruption.



2.3.5.3 Vehicular Access

Vehicular access to the Project Site would be the same for the CEQA Proposed Project and CEQA Reduced Density Alternative and would be primarily from Wescoat Road, Cody Road, and Girard Road, as shown in Figure 2-12, Conceptual Internal Vehicular Circulation Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative**.**

The proposed street improvements for vehicular access within the Project Site include:

- Realignment of Cody Road to the east along the northern boundary of the Project Site.
- Realignment of Girard Road to the north along the southern boundary of the Project Site.

Figure 2-12
Conceptual Internal Vehicular Circulation Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative
Berkeley Space Center at NASA Research Park

- Construction of the Girard Connector to provide a connection from Girard Road to Wescoat Road.
- Extension of and improvements to Dailey Road between Subareas 1, 2, 5 and 6 to connect Girard Road to Wescoat Road in the western portion of the Project Site.
- Connection of Girard Road to Cody Road in the southeastern portion of the Project Site for access to Research and Office buildings, Student/Faculty Housing, and parking structures off Girard Road as well as accessing Shared Use Streets within Subareas 5 and 6.
- Construction of the Subarea 4 Street between Subareas 3, 4, and 5 to connect Girard Road to Cody Road in the southeastern portion of the Project Site for access to the Project Site's parking structure in Subarea 4 and loading access to portions of Subareas 3 and 7.
- Construction of Girard Road between Dailey Road and Wescoat Road for access to Research and Office buildings, Student/Faculty Housing, and parking structure within Subarea 6 as well as Shared Use Streets within Subarea 6.
- Improvements to Wescoat Road, along Subareas 1, 2, and 6 for bicycle lanes and access to Project Site.
- Construction of Shared Use Streets[32] within each Subarea that would generally terminate at the Central Green and Promenade. The Shared Use Streets would provide vehicular access to primarily loading and service areas.

For each design review application, driveway access points along perimeter roads (i.e., Cody Road, Wescoat Road, and Girard Road) to the Project Site would be evaluated to determine if they warrant new signals or signage, per the California Manual of Uniform Traffic Control Devices, in connection with NASA's NRP Design Review Board process (pursuant to APR 8822.1).

2.3.5.4 Loading Access

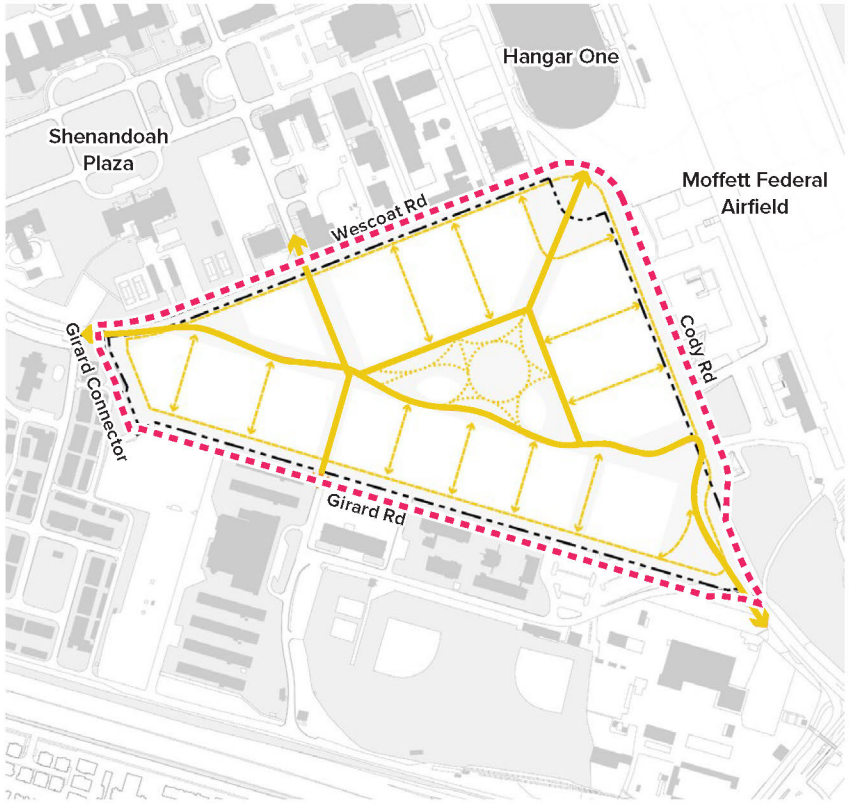
On- and off-street loading throughout the Project Site would rely on a combination of centralized loading docks and curb cuts, ensuring adequate circulation and providing access for trucks and other large vehicles. The centralized loading docks would be between proposed buildings on the Shared Use Streets, minimizing the space required for off-street loading areas. To increase servicing flexibility for truck parking, flex curbs would be utilized to reduce the competition for curb space. Loading docks and service areas would be screened from view from public streets. In addition, the CEQA Proposed Project and CEQA Reduced Density Alternative would enforce restrictions on the size of trucks to maintain truck circulation in areas away from the center of the site. During peak operational hours, vehicles accessing the Project Site would be limited to approximately 40 feet in length. However, larger vehicles would be able to access the Project Site for loading during off-peak delivery hours (i.e., before 7:00 a.m. or after 9:00 p.m. under Open Campus conditions, which are discussed in this section under the *Open Campus* subheading).

[32] *Shared Use Streets* would not include formal distinctions for spaces that would be used by vehicles and bicyclists. Shared Use Streets would include shared-use markings for bike and vehicular uses as well as pedestrian sidewalks. The lane width for Shared Use Streets would be increased to provide the turning radii and clearances needed to access the building loading docks for delivery and logistical nodes. Sidewalks would be provided for pedestrian use.

2.3.5.5 Emergency Vehicle Access

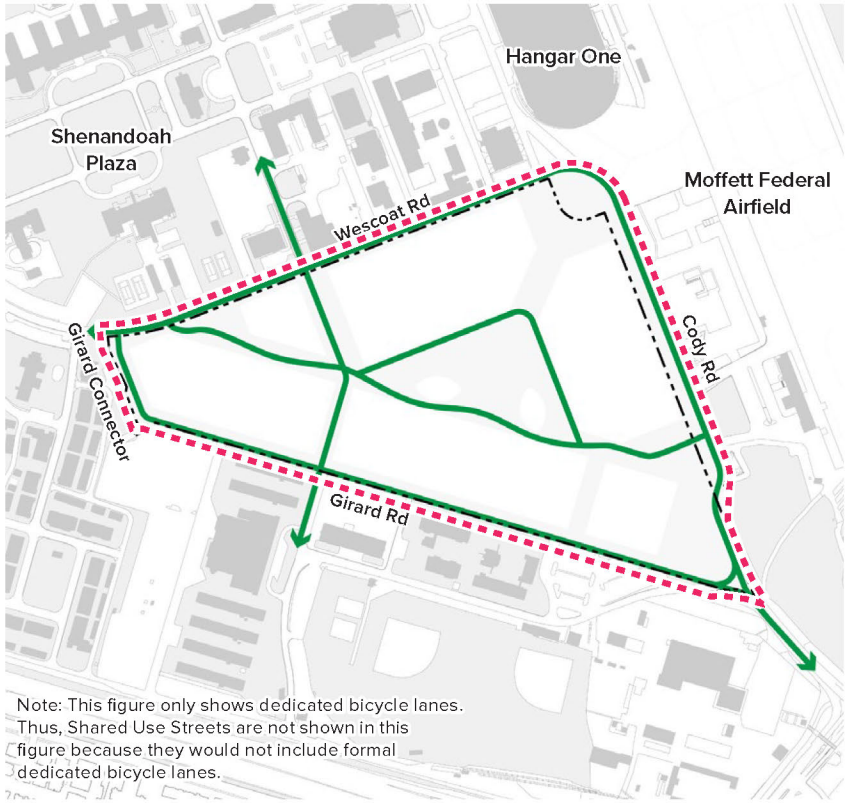
Emergency vehicle access would be provided from both the interior and exterior of the Project Site. Access for emergency vehicle aerial apparatuses would be provided along the outer perimeter of the Project Site, along Wescoat Road, Cody Road, and Girard Road. Interior emergency vehicle access would be provided around the Central Green and the Promenade, as well as from Dailey Road, Shared Use Streets, and the proposed Subarea 4 Street in the southeastern portion of the Project Site.

2.3.5.6 Pedestrian/Bicycle Circulation and Parking



Pedestrian and bicycle circulation within the Project Site would be the same for the CEQA Proposed Project and CEQA Reduced Density Alternative and would include a network of dedicated bicycle lanes, pathways, and landscaped areas for pedestrians and bicyclists, as shown in Figure 2-13, Conceptual Pedestrian and Bicycle Circulation Plans for the CEQA Proposed Project and CEQA Reduced Density Alternative. The proposed pedestrian network would primarily include a Promenade with a multi-modal, car-free connection through the Project Site in the east–west direction, sidewalks along the Dailey Road extension in the western portion of the Project Site, and a pathway along the boundary of the Central Green to Hangar Commons. In addition, the pedestrian network would include the Shared Use Streets between buildings. Primary building entrances and lobbies would be accessible along frontages facing the Central Green and Promenade, while service entrances would be located away from the Central Green, closer to the exterior of the Project Site.

The proposed bicycle network would include the Promenade through the Project Site in the east–west direction, the Dailey Road extension in the western portion of the Project Site, and a pathway along the boundary of the Central Green. In addition, the bicycle circulation improvements along the boundaries of the Project Site include the construction of Class II bicycle lanes on both sides of Wescoat Road, Cody Road, and Girard Road. The proposed bicycle network would provide access and connections to other portions of NASA ARC north of the Project Site and to the Bayshore/NASA VTA light rail station south of the Project Site.



Short- and long-term bicycle parking spaces would be provided throughout the Project Site. Class II short-term bicycle racks would be provided in easily accessible locations close to building entrances, while Class I long-term bicycle parking would be provided in covered and secured structures equipped with card-key or other security technology for access control. Tables 2-11 and 2-12 summarize the proposed bicycle parking ratios and approximate number of bicycle parking spaces for the CEQA Proposed Project and CEQA Reduced Density Alternative, respectively. The CEQA Proposed Project and CEQA Reduced Density Alternative would have the same fixed parking ratios; however, different numbers of parking spaces would be provided depending on the amount of square footage constructed. The CEQA Proposed Project and CEQA Reduced Density Alternative will adhere to the Maximum and Minimum Development Parameters set forth in the proposed Development Guidelines (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*).

Total				***296***	***873***

Source: Proposed Berkeley Space Center Master Plan, Spring 2026. See Appendix 2-1 of this joint EIR/EIS.

Notes:

sf = square feet; R&D = research and development

a. The bicycle parking ratios are fixed. The actual number of bicycle parking spaces to be constructed depends on the square footage constructed. The CEQA Reduced Density Alternative will adhere to the Maximum and Minimum Development Parameters and the Standards set forth in the proposed Development Guidelines (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*).

b. Refer to Table 2-8 and 2-9 for the number of anticipated employees and students that would be generated by the CEQA Reduced Density Alternative.

c. Refer to Table 2-8 for the number of proposed units under the CEQA Reduced Density Alternative.

As discussed under the *Transportation Demand Management* subheading in Section 2.3.5, *Transportation and Circulation*, the CEQA Proposed Project and CEQA Reduced Density Alternative would include a project-specific TDM plan to reduce the vehicle trips and associated vehicle miles traveled (VMT) generated by the proposed project. The project-specific TDM plan includes on-site Class I and II bicycle parking. Under the CEQA Proposed Project, a minimum of approximately 459 short-term bicycle parking spaces and a minimum of approximately 1,342 long-term bicycle parking spaces would be provided throughout the Project Site. Under the CEQA Reduced Density Alternative, a minimum of approximately 296 short-term bicycle parking spaces and a minimum of approximately 873 long-term bicycle parking spaces would be provided throughout the Project Site.

2.3.5.7 Vehicular Parking

All proposed parking would be provided in two above-ground parking garages. Subarea 4 would include a parking garage; Subarea 6 would include either an above-ground parking garage or a podium parking structure. The height of the parking garages would be consistent with the height of the other proposed buildings, as described in Section 2.3.2.4, *Building Heights and Stepdown Zone*. The parking garages would be available for use by employees, students, faculty, guests, and visitors associated with any of the proposed uses in each Subarea.

The Project Site's proximity to the Bayshore/NASA VTA light rail station, along with the project-specific TDM plan, is projected to result in lower parking demand; the TDM plan is described in this section under the *Transportation Demand Management* subheading. Table 2-13 summarizes the proposed minimum parking ratios and approximate number of parking spaces for the CEQA Proposed Project and CEQA Reduced Density Alternative. The CEQA Proposed Project and CEQA Reduced Density Alternative would have the same fixed parking ratios; however, the CEQA Proposed Project and CEQA Reduced Density Alternative would provide different numbers of parking spaces, depending on the amount of square footage constructed under the CEQA Proposed Project and CEQA Reduced Density Alternative. The CEQA Proposed Project and CEQA Reduced Density Alternative will adhere to the Maximum and Minimum Development Parameters and the Standards set forth in the proposed Development Guidelines (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*). Under the CEQA Proposed Project, the proposed project would include up to approximately 3,419 parking spaces, whereas the CEQA Reduced Density Alternative would include up to approximately 2,063 parking spaces. In addition, the CEQA Proposed Project and CEQA Reduced Density Alternative would include parking spaces designed to meet California Building Code accessible parking, carpool/vanpool, EV charging station, and EV-capable requirements.

Table 2-13. Proposed Vehicular Parking for the CEQA Proposed Project and CEQA Reduced Density Alternative

		CEQA Proposed Project (NEPA Build Alternative 1)		CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Total	—	—	***3,419***	—	***2,063***

Source: Proposed Berkeley Space Center Master Plan, Spring 2026. See Appendix 2-1 of this joint EIR/EIS.

Notes:

sf = square feet; R&D = research and development

a. The parking ratio includes a shared parking reduction target of 15 percent, which is applied evenly to each proposed land use in order to reduce the number of parking spaces required for the CEQA Proposed Project and CEQA Reduced Density Alternative.

b. The parking ratios are fixed. The actual number of parking spaces to be constructed depends on the square footage constructed. The CEQA Proposed Project and CEQA Reduced Density Alternative will adhere to the Maximum and Minimum Development Parameters and the Standards set forth in the proposed Development Guidelines (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*).

2.3.5.8 Transportation Demand Management

The CEQA Proposed Project and CEQA Reduced Density Alternative would include a project-specific TDM plan to reduce the vehicle trips and associated vehicle miles traveled (VMT) generated by the proposed project through a range of design features (e.g., mix of complementary land uses to increase internal trips, on-site amenities to reduce off-site trips, pedestrian and bicycle infrastructure, preferential carpool and vanpool parking, limited automobile parking supply, and ample bicycle parking) and ongoing operational programs (e.g., transit pass/subsidy programs, shuttles, and participation in the NRP Transportation Management Association) to achieve TDM mode-shift targets and thereby reduce the number of trips made by project-generated employees, students/faculty and visitors. Appendix 2-4 of this joint EIR/EIS includes the project-specific TDM plan.[33] The project-specific TDM plan is designed to reduce the trip generation by 22 percent as part of the CEQA Proposed Project and CEQA Reduced Density Alternative. The 22 percent TDM reduction aligns with the TDM requirements in the 2002 PEIS. Because the proposed project is

33 The project-specific TDM Plan is tentative, as transportation-related studies may validate the approach in the TDM Plan or require adjustments to the TDM Plan.

anticipated to be built out in phases, the project-specific TDM plan anticipates an increase in mode shares at each development phase. Overall, the CEQA Proposed Project and CEQA Reduced Density Alternative would implement TDM measures that would complement its mixed-use land use program as well as its proximity to the Bayshore/NASA VTA light rail station. Ultimately, the project-specific TDM plan would include a list of TDM features and programs, an estimate of potential trip reductions, and a recommended monitoring program.

As discussed above, the project-specific TDM plan would include, but not be limited to, the following design features:

- **Passenger pick up/drop off areas:** The proposed project would include passenger pick up/drop off areas with ridesharing on the Girard Connector, Girard Road, Dailey Road, Wescoat Road, and Subarea 4 Street. Some of the passenger pick up/drop off areas on Dailey Road would include a proposed shuttle stop (discussed below). The passenger pick up/drop off areas on the Girard Connector and Girard Road would include flex curbs, which also allows for loading.
- **Shuttle:** The proposed project would establish a shuttle system to service "last mile" connections between the Project Site and nearby transit hubs, including the Mountain View Caltrain station and the Bayshore/NASA VTA light rail station. There would be one shuttle stop within the Project Site on Dailey Road.
- **Transit:** The proposed project would plan to reroute VTA's 51 bus from North Akron Road to Wescoat Road and move the VTA bus stop from South Akron Road to the edge of the Project Site at the corner of Wescoat Road and McCord Avenue.

2.3.5.9 Transit Priority Areas

In accordance with California Senate Bill (SB) 743, aesthetics and parking shall not be considered in determining if a project has the potential to result in significant environmental effects under CEQA, provided the project meets the following criteria under California Public Resources Code Section 21099, Modernization of Transportation Analysis for Transit-Oriented Projects:

- The project is on an infill site,
- The project is in a Transit Priority Area (TPA), or
- The project is a residential, mixed-use residential, or employment-center project.

An infill site is defined as a lot within an urban area that has been previously developed or a vacant site where at least 75 percent of the perimeter of the site adjoins, or is separated only by an improved public right-of-way from, parcels that are developed with qualified urban uses (Public Resources Code Section 21099[a][4]). A TPA is defined as an area within 0.5 mile of an existing or planned major transit stop, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program or applicable regional plan (Public Resources Code Section 21099[a][7]). Examples include a rail transit station, ferry terminal served by transit, or the intersection of two or more major bus routes. Public Resources Code Section 21099 does not provide a definition for a residential or mixed-use residential project, however, Public Resources Code Section 21099[a][1] defines an employment center project as one that is located on a property zoned for commercial uses with a floor area ratio of no less than 0.75 and located within a TPA.

The proposed project meets all of the above criteria. The Project Site is a qualifying infill site. The Limits of Work, which include the Project Site, are currently developed with 18 buildings. The existing buildings are mostly vacant; many were formerly used as ancillary buildings that supported Navy operations. Most of the perimeter of the Project Site adjoins urban uses. The Metropolitan Transportation Commission (MTC) has identified locations for TPAs within the Bay Area. The Project Site is within a TPA because of its proximity to the Bayshore/NASA VTA light rail station, as shown in Figure 2-14, Transit Priority Area Map.[34] The CEQA Proposed Project and CEQA Reduced Density Alternative meet the above criteria because they both consist of an employment center use with a floor area ratio of 1.6 and 1.0, respectively. The CEQA Proposed Project would construct more Research and Office Uses than the CEQA Reduced Density Alternative. Because the CEQA Proposed Project and CEQA Reduced Density Alternative meet the three TPA criteria, the EIR portion of this joint document does not consider aesthetics or vehicular parking in determining the significance of impacts under CEQA. However, Section 3.2, *Aesthetics and Visual Resources,* of this joint EIR/EIS includes a discussion of the potential impacts of the proposed project related to aesthetics for informational purposes and for consistency with the aesthetics and visual resources analysis required under NEPA and the EIS portion of this joint document.

2.3.6 Utilities

In addition to proposed redevelopment of the Project Site (see Section 2.3.2, *Characteristics*), the CEQA Proposed Project and the CEQA Reduced Density Alternative include the same off-site utility improvements outside of the Project Site but within NASA ARC (unless otherwise noted), as described in this section. The CEQA Proposed Project and the CEQA Reduced Density Alternative would have the same infrastructure for utilities (i.e., wet and dry utilities) installed on-site and off-site as well as the same utility connection points to those utilities. The design of the proposed utility infrastructure is based on relevant design criteria from applicable agencies, assumed flow requirements, and other relevant standards (e.g., the California Waterworks Standards as outlined in Title 22 of the California Code of Regulations).[35] The specifics regarding utility connections and designs will be evaluated through NASA's NRP Design Review Board process in connection with NASA's approval of the proposed project pursuant to APR 8822.1, and through NASA's Construction Permit Review Process, established by APD 8829.1. In addition, tenants/sub-tenants may need to execute a Reimbursable Space Act Agreement with NASA that allows NASA to convey certain utilities and for the tenants to reimburse NASA for consumption and conveyance.

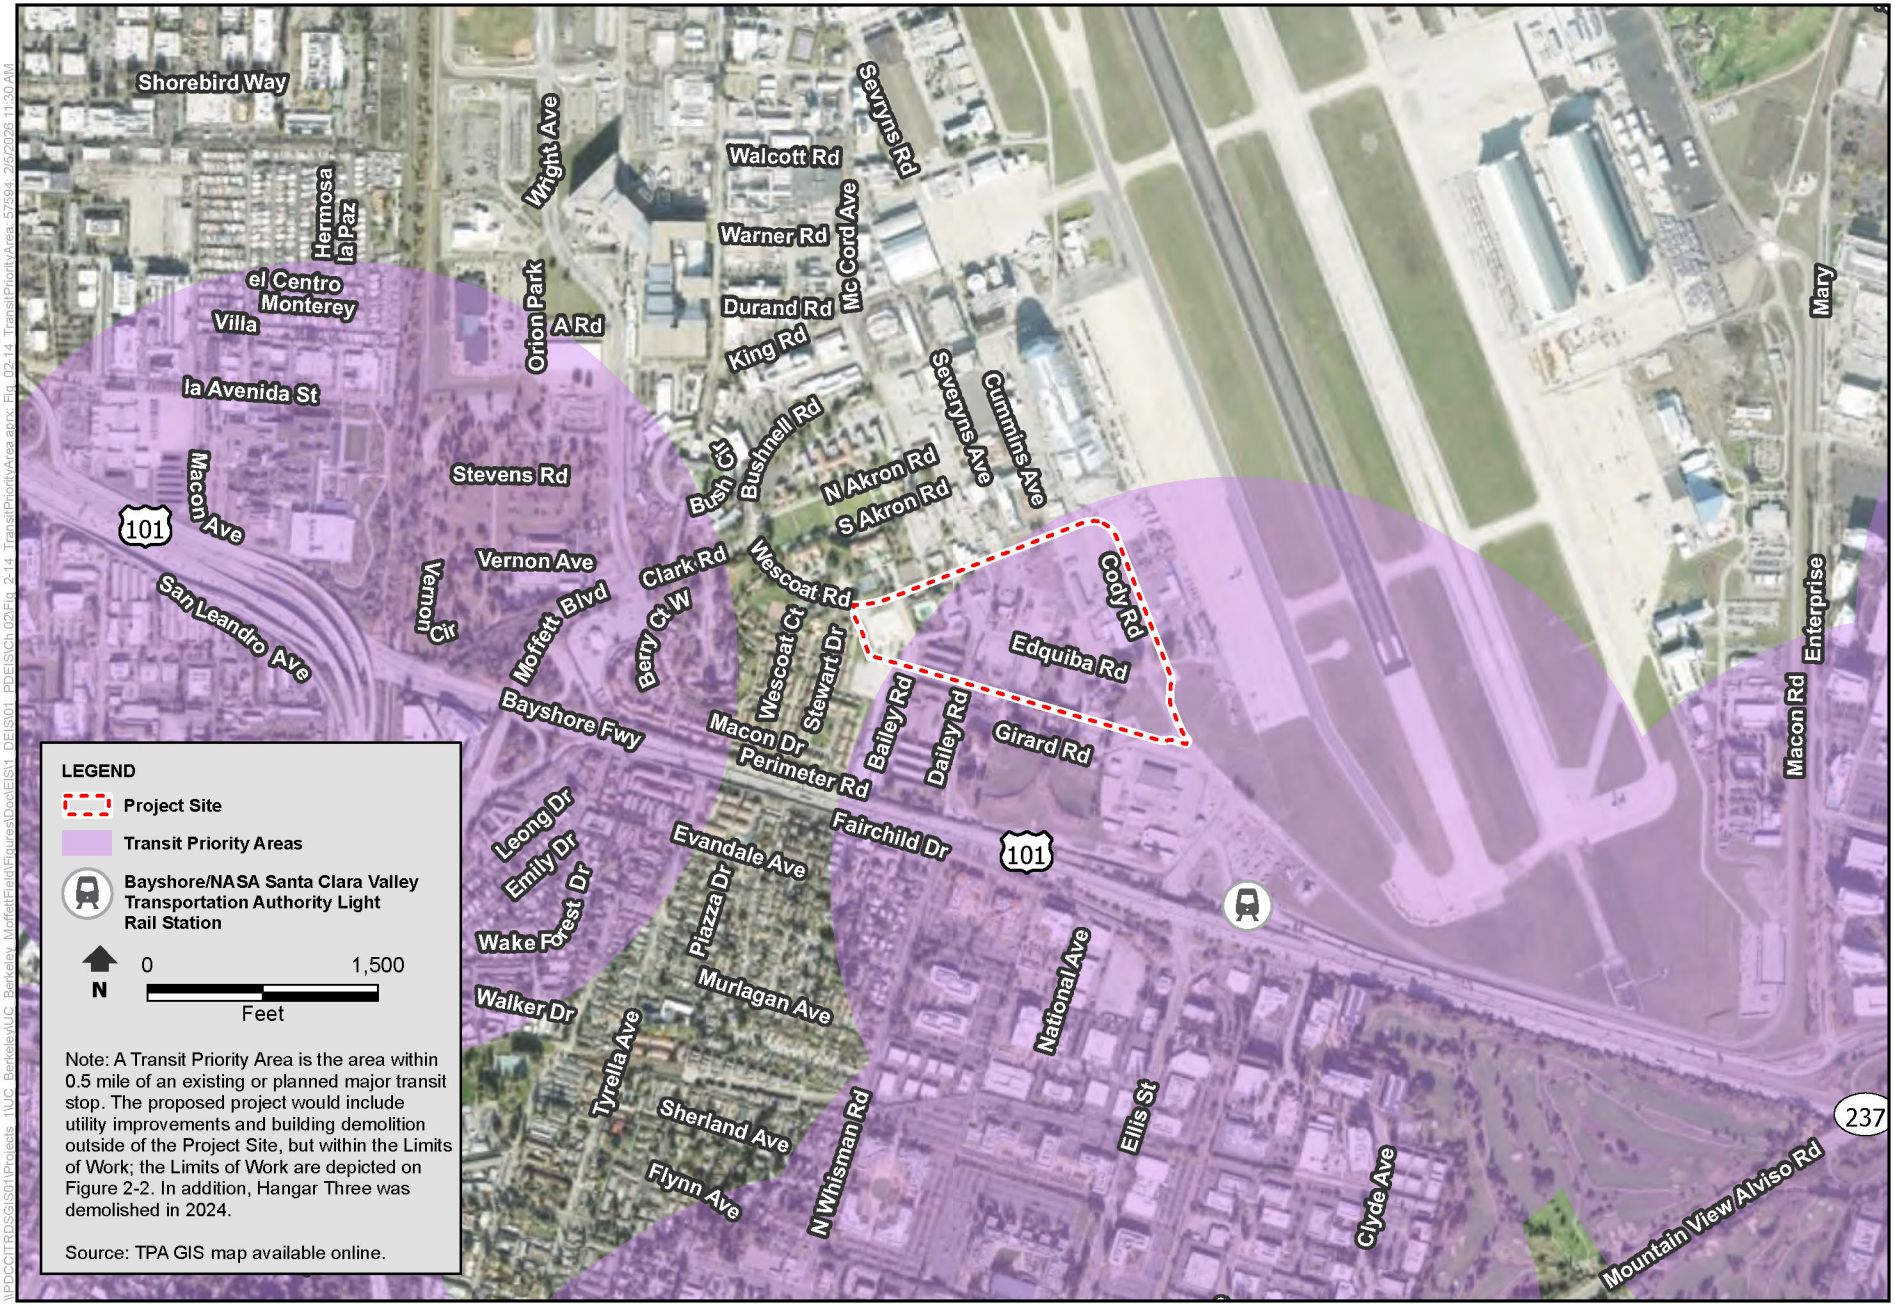

Figure 2-14
Transit Priority Area Map
Berkeley Space Center at NASA Research Park

The Project Proponent would compensate NASA for services provided to the proposed project via the Institutional Shared Pool (ISP). The ISP is the mechanism by which NASA charges its tenants for costs for common levels of services provided throughout its Property on an annual basis (e.g., security and law enforcement, fire department response and inspections, emergency medical response, first responder operations, common grounds [including recreational areas], roads, and infrastructure maintenance and repairs), and additional demand services above the common levels of service. The Project Proponent would comply with the requirements of the ISP on an annual basis.

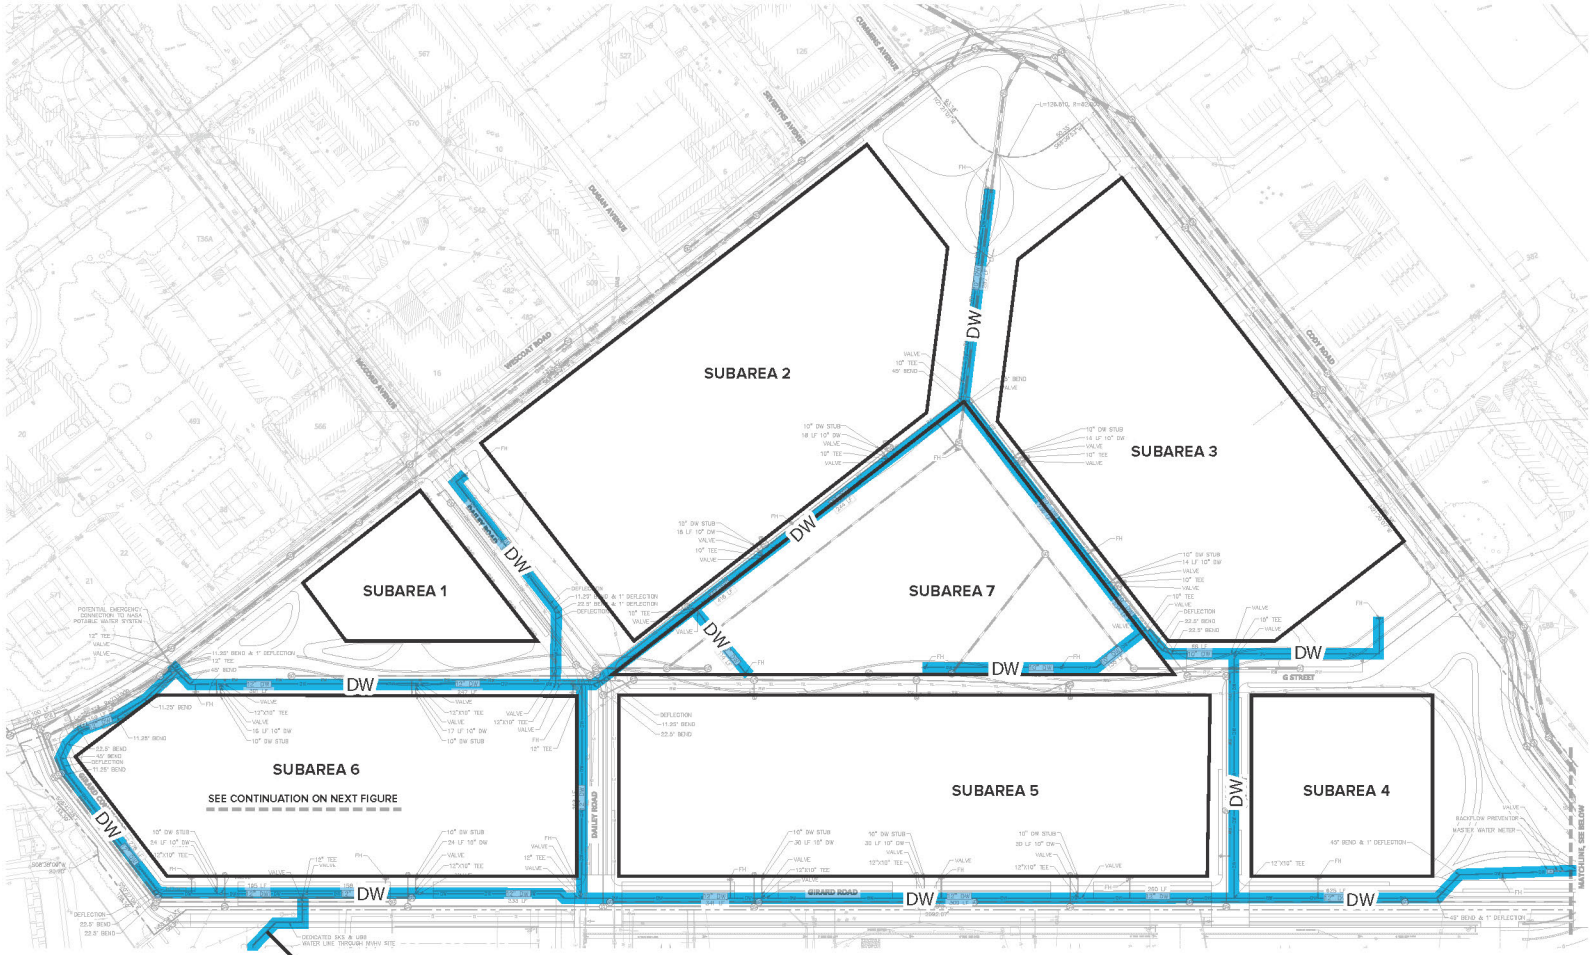
2.3.6.1 Water

The Project Site is located within the San Francisco Public Utilities Commission (SFPUC) suburban retail service area, operating under a regulatory framework that differs from that of wholesale customers.[36] Therefore, NASA obtains potable water from SFPUC and owns and operates the potable water distribution system to all occupants on federal property, and will continue to be the potable water service provider for the Project Site. Existing potable water demand at the Project Site is estimated at 0.6 acre-feet per year; this is less than 0.1 percent of total historical NASA ARC demand, which averaged 574 afy from 2019 to 2023.[37]

The total potable water demand would be approximately 124 acre-feet per year for the CEQA Proposed Project.[38] NASA ARC and NRP, including the Project Site, are served by the 18-inch Tyrella Feed, one of three feeds that connect directly to the SFPUC Hetch Hetchy Aqueduct. The NASA-owned Tyrella Feed starts immediately north of U.S. 101, crosses under it to the south where the flow is read by an SFPUC master meter at the corner of Tyrella Avenue and Hetch Hetchy Trail, and then enters NASA ARC at South Perimeter Road in Wescoat Village.

Water Main Connection Options

The CEQA Proposed Project and the CEQA Reduced Density Alternative would include 10-inch and 12-inch water mains on-site that would be routed from the connection on the southwest side of the site to the proposed buildings through a looped system that would extend east–west along Girard Road and north of the center of the Project Site, as shown in Figure 2-15a, Conceptual Utilities Plan (Water). Backflow preventors, meters, and pressure regulators would be installed on water supply lines. Three sampling ports would also be installed near representative population areas. In addition, dead-end mains would be provided along all shared-use roads for building services and fire hydrants.



---

[36] The SFPUC *in-city system* serves a residential population of nearly 844,000 in addition to San Francisco–based businesses; *suburban retail customers* include a residential population of approximately 2,000, as well as businesses and institutions, in San Mateo, Santa Clara, Alameda, Tuolumne, and San Joaquin Counties. Figure 2-15a
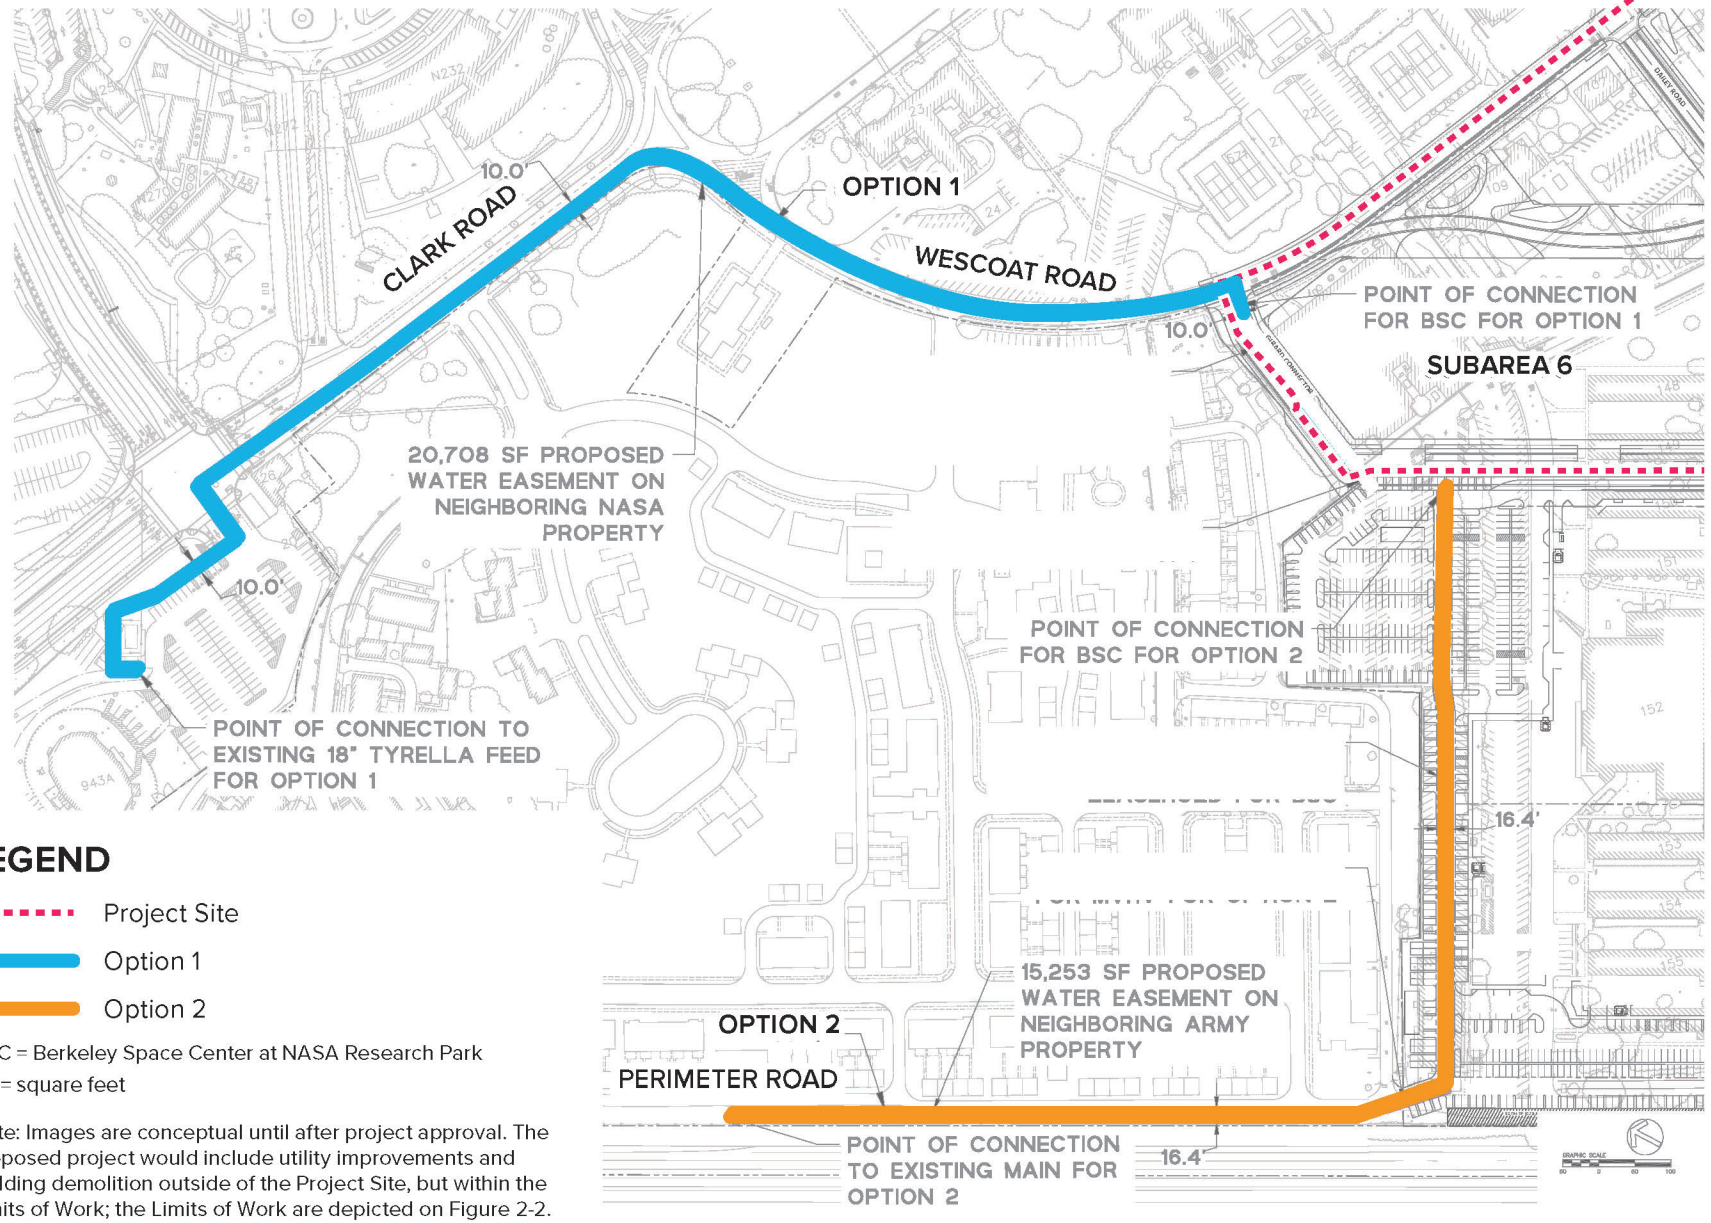
Conceptual Utilities Plan (Water)
Berkeley Space Center at NASA Research Park

The Tyrella Feed would provide potable water and fire flow water to the Project Site. As discussed below and shown in Figure 2-15b, Conceptual Utilities Plan (Tyrella Feed Water Main Connection Options 1 and 2), the CEQA Proposed Project and the CEQA Reduced Density Alternative could include two possible routings for the off-site water mains and connection to the Tyrella Feed: Tyrella Feed Water Main Connection Option 1 and Tyrella Feed Water Main Connection Option 2.

- **Tyrella Feed Water Main Connection Option 1:** The CEQA Proposed Project and the CEQA Reduced Density Alternative could connect to an existing 18-inch Tyrella Feed at the parking lot near the main gate on Clark Road. A dedicated 12-inch water main line could be installed along Clark Road, Wescoat Road, and the Girard Connector, entering the Project Site in Subarea 6 at the intersection of Wescoat Road and Girard Connector. Under Water Main Connection Option 1, the project's off-site water improvements would remain within NASA ARC.
- **Tyrella Feed Water Main Connection Option 2:** The CEQA Proposed Project and the CEQA Reduced Density Alternative could connect to the Tyrella Feed through a new master meter connection near the intersection of South Perimeter Road and Wescoat Court. A dedicated 12-inch water main line could be installed along South Perimeter Road and east of Bailey Road, entering the Project Site in Subarea 6 east of the intersection of the Girard Connector and Girard Road. Under Water Main Connection Option 2, the project's off-site water improvements (along South Perimeter and Baily Roads) would cross over Army controlled land, requiring approval of an easement by the Army.



The potable water system could also include an emergency backup connection to the NASA water system—specifically, the P500—at the intersection of Cody Road and Girard Road at the southeast corner of the Project Site. This connection would also be capable of backfeeding NASA's water system in case of emergencies.

2.3.6.2 Recycled Water

There is no existing use of recycled water at the Project Site. The total recycled water demand would be approximately 160 acre-feet per year for the CEQA Proposed Project.[39] While the City of Sunnyvale and Mountain View both have recycled water systems adjacent to NASA ARC, non-potable water demands for the proposed project (landscape irrigation, cooling, indoor flushing, and cleaning of parking structures) would be supplied by Mountain View through a new NASA service connection to the city's recycled water distribution system. The City of Sunnyvale's system runs along the east side of NASA ARC; the Mountain View recycled water system extends to NASA ARC at the northwest corner of the Bay View area. As described in Section 3.18, *Utility and Service Systems*, of this joint EIR/EIS, it is anticipated that the City of Mountain View's service availability would be extended (i.e., the flow of recycled water would be extended) to the south along RT Jones Road via an existing main line not currently in service to the main gate on Clark Road to provide a recycled water connection to the NRP. The existing main line is owned and operated by NASA; this service extension, which would consist of loading the main line with recycled water, is not part of the CEQA Proposed Project or the CEQA Reduced Density Alternative.

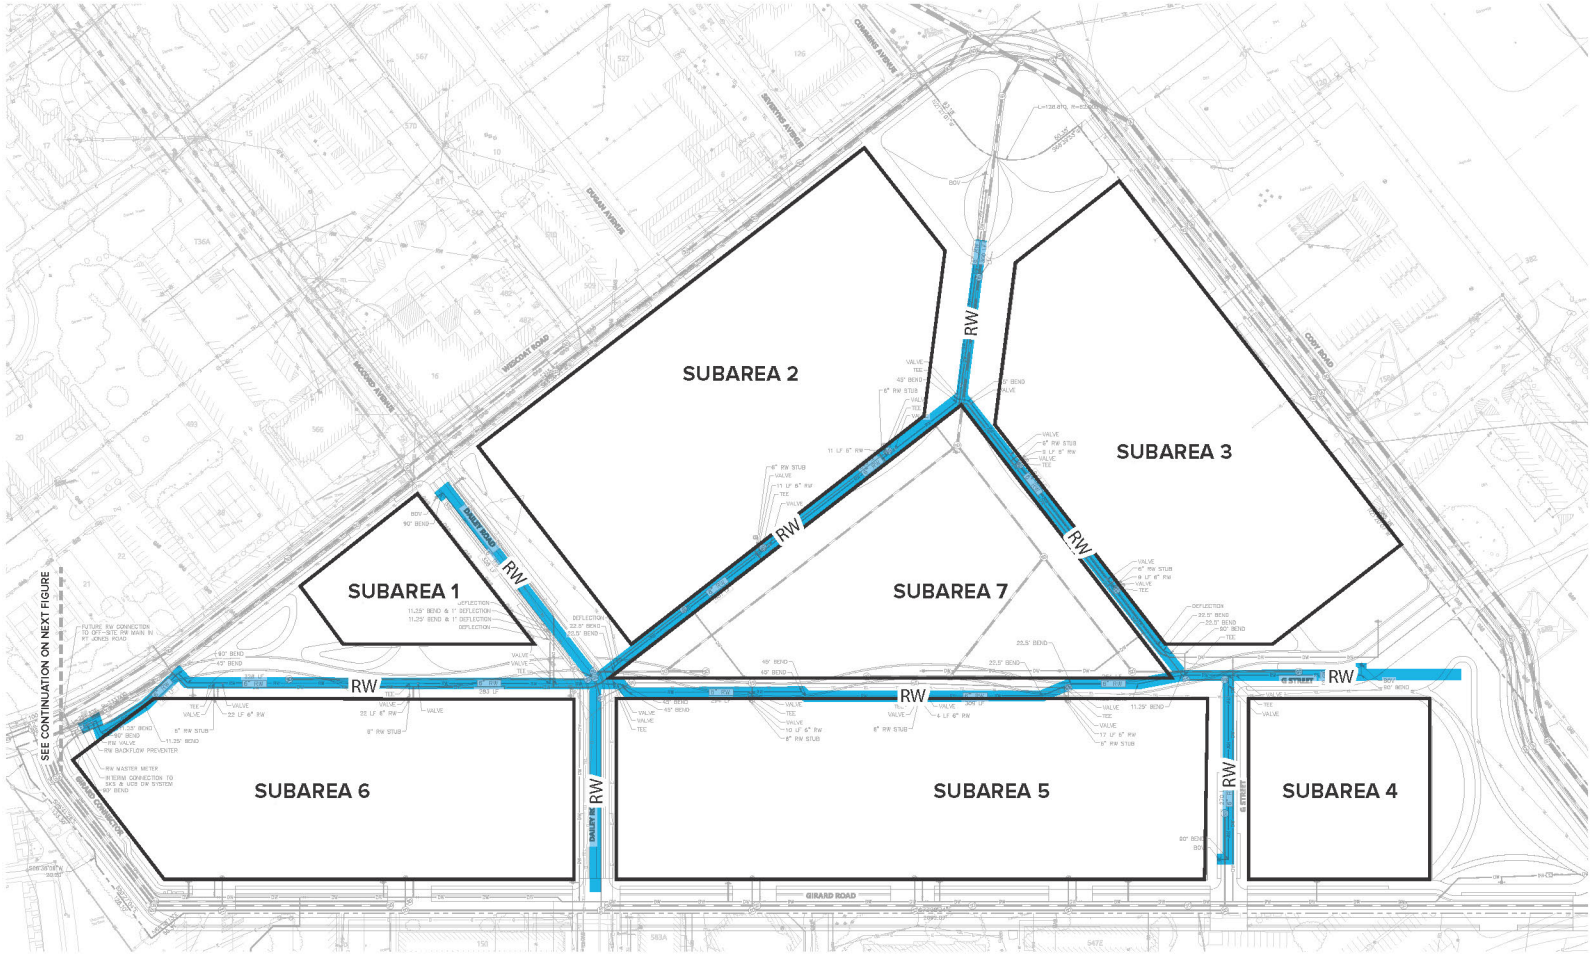
Recycled Water Main Connection Options

The CEQA Proposed Project and the CEQA Reduced Density Alternative would include 6- to 12-inch recycled water mains on-site with branches throughout the Project Site to serve the proposed buildings and irrigated areas, as shown in Figure 2-16a, Conceptual Utilities Plan (Recycled Water). The on-site recycled water system would be looped internally. As discussed below and shown in Figure 2-16b, Conceptual Utilities Plan (RT Jones Road Recycled Water Main Connection Options 1 and 2), the CEQA Proposed Project and the CEQA Reduced Density Alternative could include two possible routings for the off-site recycled water mains to one point of connection to the existing recycled water main in RT Jones Road near the main gate: RT Jones Road Recycled Water Main Connection Option 1 and RT Jones Road Recycled Water Main Connection Option 2.

- **RT Jones Road Recycled Water Main Connection Option 1:** The CEQA Proposed Project and the CEQA Reduced Density Alternative could connect to the existing recycled water main in RT Jones Road via a new 12-inch main along Clark Road and Wescoat Road, entering the Project Site in Subarea 6 at the intersection of Wescoat Road and the Girard Connector. Under Recycled Water Option 1, the project's off-site recycled water improvements would remain within NASA ARC.
- **RT Jones Road Recycled Water Main Connection Option 2:** The CEQA Proposed Project and the CEQA Reduced Density Alternative could connect to the existing recycled water main in RT Jones Road via a new 12-inch recycled water main in the parking lot near the main gate on Clark Road, along South Perimeter Road, and east of Bailey Road, entering the Project Site in Subarea 6 east of the intersection of the Girard Connector and Girard Road. Recycled Water Option 2 would require the project's off-site recycled water improvements (along Clark, South Perimeter and Bailey Roads) to cross over Army controlled land, requiring approval of an easement by the Army.



CEQA Proposed Project with the Water Reuse Facility Option

Only the CEQA Proposed Project includes the WRF Option. The WRF Option could be implemented in addition to the recycled water main connection options discussed above. The WRF Option would include an approximately 15,000-square-foot WRF that would produce recycled water to serve the proposed buildings and irrigated areas, as shown in Figure 2-17, Conceptual Utilities Plan (Water Reuse Facility Option). The facility would process all of the CEQA Proposed Project's wastewater; and the facility would reduce the CEQA Proposed Project's demand for recycled water.[40] The facility's anticipated production would be approximately 37,000 to 44,000 gpd. A backup connection to the City of Mountain View's recycled water system would supplement the CEQA Proposed Project's anticipated demand for recycled water for emergency purposes.

The WRF Option would incorporate the facility on the ground floor of the parking structure located in Subarea 6 near Girard Road; there would be no reduction in the number of parking spaces provided in Subarea 6 as a result of the WRF Option due to the flexibility in the design of the parking structure. The WRF Option would also include an approximately 300-foot pressurized main along the Girard Connector that would connect the WRF to the recycled water distribution infrastructure within the rest of the Project Site (see Section 2.3.6.2, *Recycled Water*). The WRF Option would

[40] The WRF Option would comply with NASA's Regulatory Review Procedures for On-Site Blackwater Treatment and Reuse.

include a sewer lift station, which would be sized appropriately to the needs of the proposed project, in the southwest corner of the Project Site (see Section 2.3.6.3, *Wastewater*), near Girard Road and the Girard Connector.

The WRF Option would be constructed in two phases to align with buildout of the CEQA Proposed Project. The first phase would occur at the end of Phase 1 of construction to serve operations related to buildout occurring during Phases 1 and 2 of the CEQA Proposed Project (see Section 2.3.4.3, *Schedule and Phasing*); this would include the wastewater treatment process, recycled water distribution pump system, and all tankage needed for process and waste streams. The first phase of construction would also include the construction of all tanks and major structures as well as the installation of approximately 50 percent of the required equipment needed to serve the CEQA Proposed Project. The second phase of construction would occur at the end of Phase 3 of construction to serve operations related to buildout occurring during Phases 3 and 4 of the CEQA Proposed Project; this would include installation of the remaining 50 percent of the required equipment needed to serve the CEQA Proposed Project.

The WRF Option would not require excavation to depths greater than otherwise required for the CEQA Proposed Project for typical utility improvements (i.e., approximately 3 to 4 feet bgs as discussed in Section 2.3.4.2, *Ground Disturbance and Excavation*).

2.3.6.3 Wastewater

The Project Site's existing sanitary sewer flow currently goes to the City of Sunnyvale's system. The City of Mountain View will be the wastewater service provider for the proposed project. Existing buildings at the Project Site are not individually metered**.** According to NASA, existing wastewater generation at the Project Site is approximately 32,366 gallons per day (gpd), based on the square footage of existing buildings; this wastewater generation does not account for historic inflow and infiltration existing sewer collection pipes. The average dry-weather flow and peak wet-weather flow increase in wastewater generation at the Project Site, which would go to the City of Mountain View's system, is estimated at approximately 440,279 gpd and 837,529 gpd, respectively, under the CEQA Proposed Project.[41]

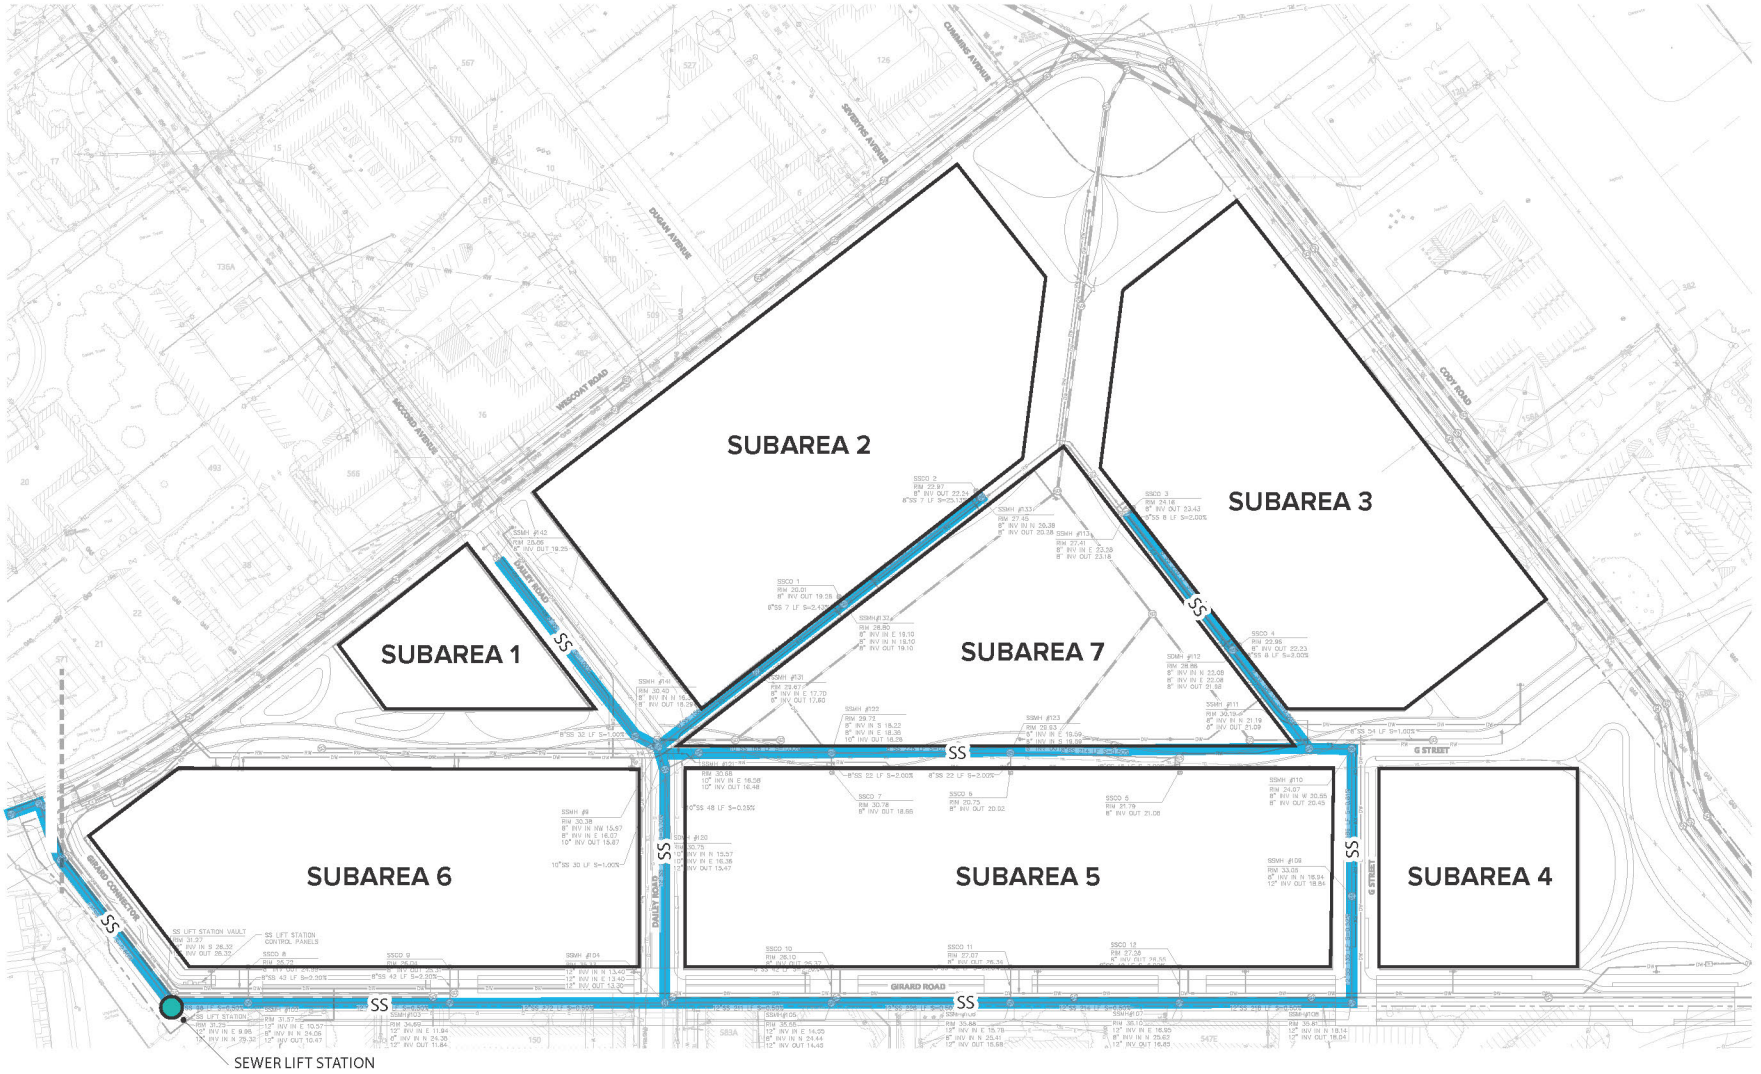
The Project Site is located between the Palo Alto Regional Water Quality Control Plant, which serves Mountain View, and the City of Sunnyvale Water Pollution Control Plant, which serves Sunnyvale. The existing sewer system at the Project Site collects and conveys all sewer discharges to the City of Sunnyvale Point of Compliance located in the golf course east of Moffett Federal Airfield, which ultimately discharges to the City of Sunnyvale Water Pollution Control Plant. The Project Site is currently served by an existing 8-inch main in Cody Road and a 10-inch main in Wescoat Road.

Groundwater dewatering would not be required during operation of the CEQA Proposed Project or the CEQA Reduced Density Alternative. No additional dewatering beyond that required by the Responsible Parties is anticipated during operational phases of the CEQA Proposed Project and the CEQA Reduced Density Alternative.

[41] BKF. 2026. *Berkeley Space Center Project, Moffett Field, NASA Research Park, Sanitary Sewer Master Plan.* Spring.

Wastewater Main Connection Options

The CEQA Proposed Project and the CEQA Reduced Density Alternative would include 8-inch, 10-inch, and 12-inch sewer lines throughout the Project Site to serve the proposed buildings, as shown in Figure 2-18a, Conceptual Utilities Plan (Wastewater). Wastewater generated from the Project Site would be routed off-site through an on-site sewer lift station in the southwest corner of the Project Site, near Girard Road and the Girard Connector. As part of the CEQA Proposed Project and the CEQA Reduced Density Alternative, a new connection to and a new meter would be installed at the point of connection to the City of Mountain View's wastewater main in RT Jones Road. As discussed below and shown in Figure 2-18b, Conceptual Utilities Plan (Mountain View Wastewater Main Connection Options 1 and 2), the CEQA Proposed Project and the CEQA Reduced Density Alternative could include two possible routings for the off-site sewer and connection to the City of Mountain View's wastewater main: Mountain View Wastewater Main Connection Option 1 and Mountain View Wastewater Main Connection Option 2.



- **Mountain View Wastewater Main Connection Option 1:** The CEQA Proposed Project and the CEQA Reduced Density Alternative could connect to the City of Mountain View's wastewater main in RT Jones Road via a new 12-inch main along Clark Road and Wescoat Road, entering the Project Site in Subarea 6 east of the intersection of the Girard Connector and Girard Road. Under Wastewater Main Connection Option 1, the project's off-site wastewater improvements (along Clark and Wescoat Roads) would remain within NASA ARC.
- **Mountain View Wastewater Main Connection Option 2:** The CEQA Proposed Project and the CEQA Reduced Density Alternative could connect to the City of Mountain View's wastewater main in RT Jones Road via a new 12-inch main south of Clark Road and along Wescoat Road, entering the Project Site in Subarea 6 at the intersection of Wescoat Road and the Girard Connector. Wastewater Main Connection Option 2 would cross over Army controlled land, requiring easement approval from the Army requiring easement approval from the Army.

2.3.6.4 Stormwater

The combined existing 10-year peak stormwater discharge rate is approximately 18.29 cubic feet per second (cfs), and the existing 10-year stormwater volume is approximately 203,838 cubic feet (cf). The proposed stormwater system would contain the 10-year storm in pipes without surcharging,[42] contain the 25-year storm in pipes with surcharging, and contain the 100-year storm in curbs with no flooding of buildings. NASA ARC campus has two stormwater drainage systems, a western drainage system and an eastern drainage system. The flow and volume noted above is the cumulative amount from both systems. The majority of the Project Site is located in the western drainage system; only a portion on the southeastern edge of the Project Site is located in the eastern drainage system. The western drainage system comprises five subsystems that drain to the western diked marsh or eastern diked marsh, both of which are approximately 1 mile north of the Project Site. The diked marshes ultimately discharge farther north into NASA ARC's stormwater retention pond. The stormwater retention pond does not have an outfall, and loses water through evaporation.

[42] *Surcharging* is when the pipe cannot release the amount of stormwater fast enough, so it begins to back up into the stormwater system.

Graphics ... 104894 (9-10-2025) TG

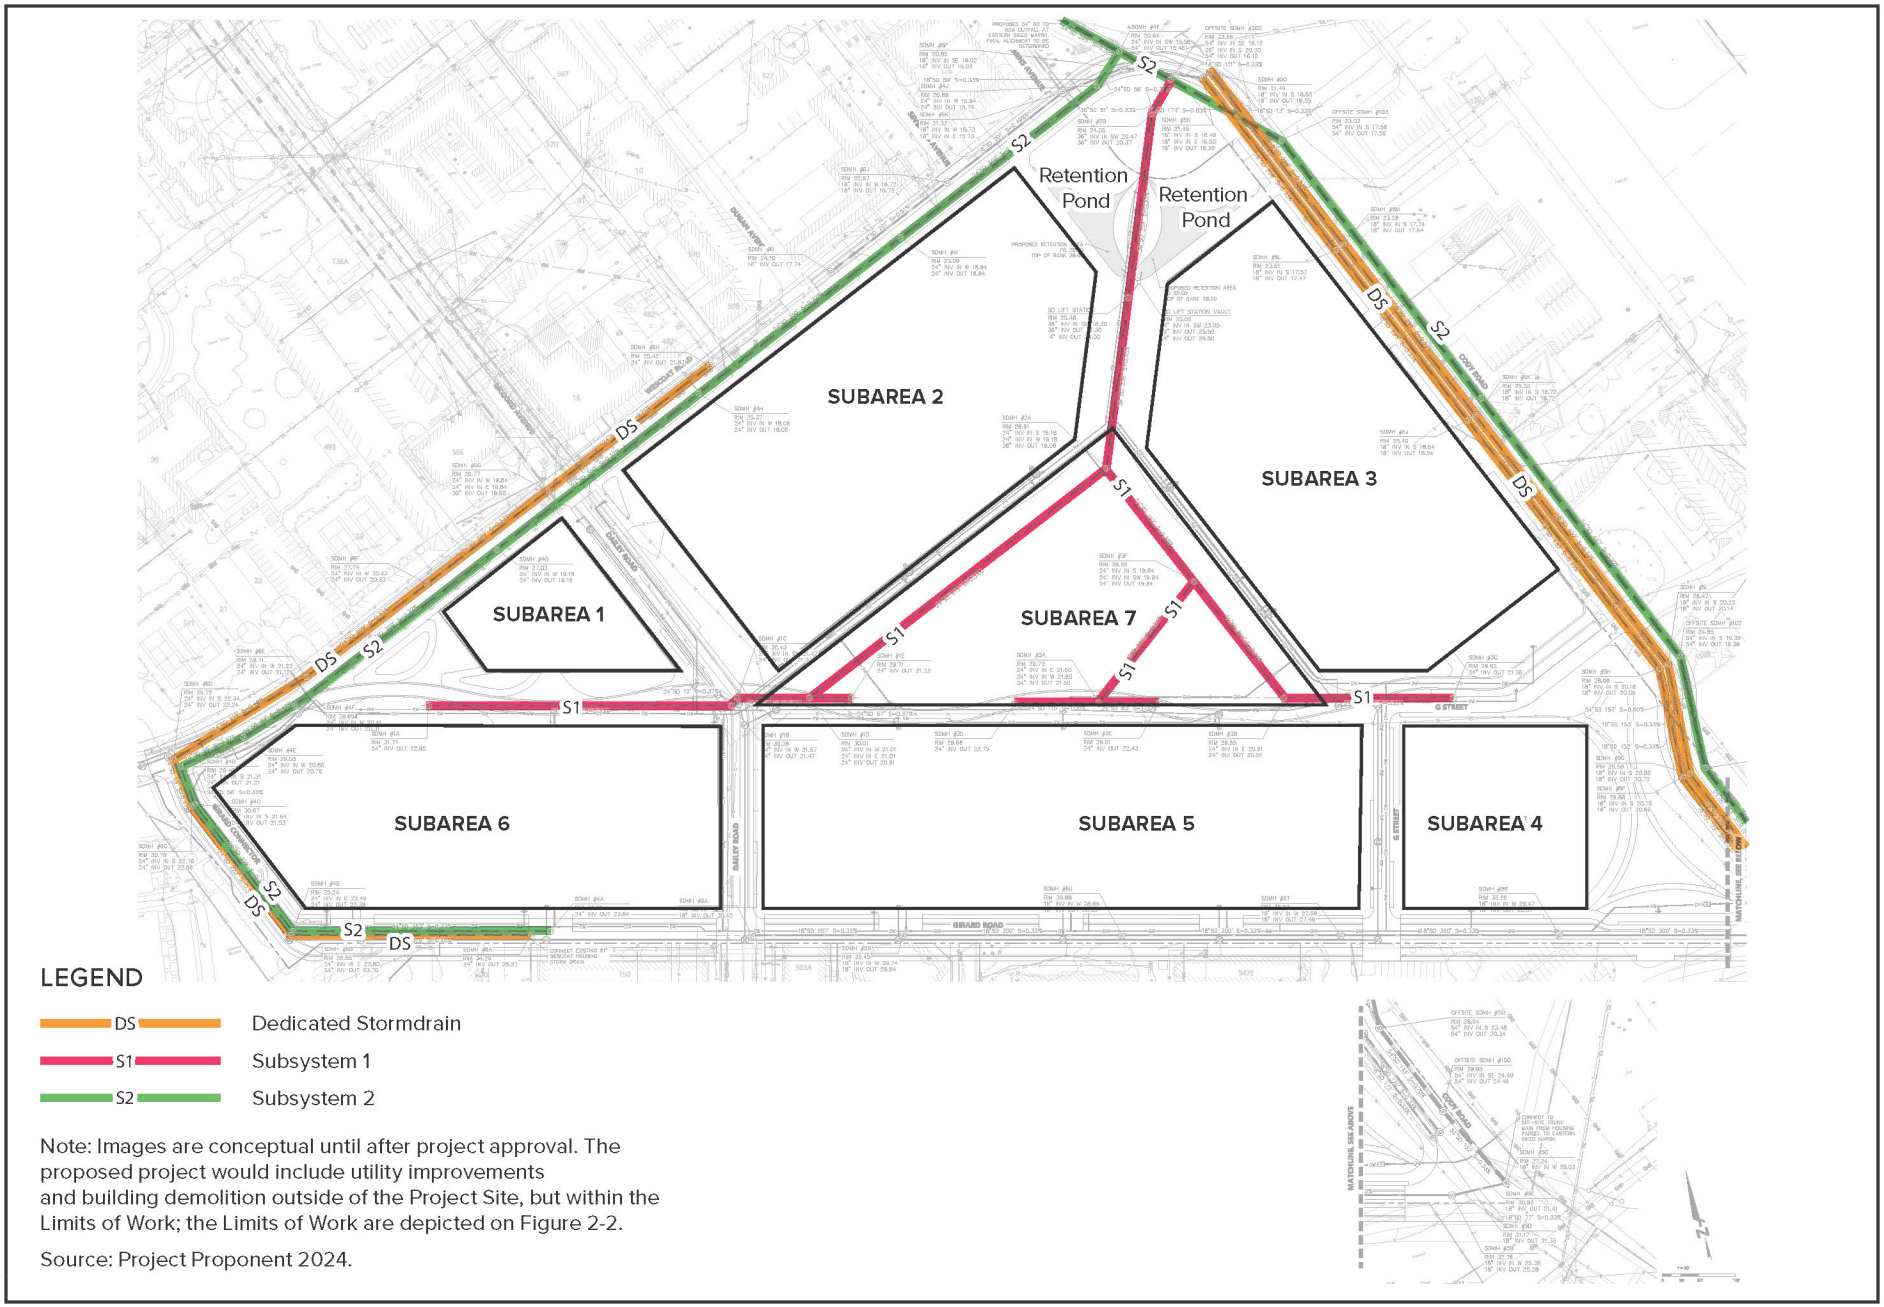
Figure 2-18b

Conceptual Utilities Plan (Mountain View Wastewater Main Connection Options 1 and 2)

Berkeley Space Center at NASA Research Park

Based on the Maximum and Minimum Development Parameters, as established in the Master Plan included in Appendix 2-1 of this joint EIR/EIS, the CEQA Proposed Project and the CEQA Reduced Density Alternative would increase the impervious surface area on the Project Site to approximately 79 percent, or a 9 percent increase from existing conditions. The increase in impervious surface area would result in a 10-year peak stormwater discharge rate of approximately 18.0 cfs and a peak volume of approximately 263,338 cf. The CEQA Proposed Project and the CEQA Reduced Density Alternative would meter flows leaving the Project Site so that the peak discharge rate would not exceed the existing discharge rate of 18.29 cfs. This would be accomplished through detention involving building oversized pipes on-site at the northern end of the Project Site as well as a proposed orifice and weir to meter flows leaving the Project Site. In addition, the CEQA Proposed Project and the CEQA Reduced Density Alternative would incorporate a retention pond to treat the approximately 60,600 cf increase in stormwater volume compared with existing conditions. The retention basin in the northern corner of the Project Site, within the Hangar Commons, would be approximately 0.5 acre in size and approximately 3 feet deep.



The CEQA Proposed Project and the CEQA Reduced Density Alternative would be required to maintain stormwater flows by not exceeding existing flows and volumes that leave the Project Site. The proposed on-site stormwater drainage system would consist of two subsystems, as shown in Figure 2-19a, Conceptual Utilities Plan (Stormwater). Subsystem 1 would make up approximately 23.5 acres on the interior of the Project Site. All stormwater from Subsystem 1 would drain to the northeast corner of the Project Site and then be discharged into the 0.50-acre retention pond and the eastern diked marsh trunk main. As mentioned above, flows would be metered upstream of the connection to the trunk main to ensure that the project's flow rate would not exceed the existing flow rate. Subsystem 2 would make up approximately 15.1 acres on the perimeter of the Project Site, along Girard Road, and the portion of the Wescoat Road and Cody Road within the lease boundary.

As an option, the CEQA Proposed Project and the CEQA Reduced Density Alternative could connect to three existing NASA storm drain mains along the northern boundary of the Project Site or construct a new off-site storm drain main, which would connect directly to the eastern diked marsh, as shown in Figure 2-19b, Conceptual Utilities Plan (Stormwater-Eastern Diked Marsh Trunk Main).

For the purposes of this joint EIR/EIS, it is assumed the off-site storm drain main and the outfall at the eastern diked marsh would be constructed as part of the proposed project.[43] Subsystem 2 would discharge to the eastern diked marsh trunk main; these improvements would not require any significant detention or retention as they are being replaced close to in-kind. As part of the proposed project, swale and rap would be installed at the eastern diked marsh outfall and typical maintenance activities at the eastern diked marsh outfall would include removal of accumulated sediment, removal of trash and debris to maintain storage capacity, vegetation control, and inspection and repair of the embankments and dewatering devices. In addition, the separate dedicated storm drain systems in Wescoat Road, Girard Road, and Cody Road would continue to flow into NASA's existing storm drain system, as the drainage pattern of each road is not changing, so the downstream system has capacity to accept these flows.

[43] The area West of Lindbergh Avenue, where the proposed off-site storm drain main and the outfall at the eastern diked marsh would be constructed, is federally owned but within the City of Mountain View's boundary. This falls under proprietary jurisdiction and is thus subject to certain state regulations.

Figure 2-19b

Conceptual Utilities Plan (Stormwater—Eastern Diked Marsh Trunk Main)

Berkeley Space Center at NASA Research Park

The NPDES Construction General Permit requires development of a Storm Water Pollution Prevention Plan (SWPPP) by a certified qualified SWPPP developer. A SWPPP includes construction and post-construction requirements. The CEQA Proposed Project and the CEQA Reduced Density Alternative would include the development and implementation of a SWPPP, including, but not limited to, the following BMPs: employee training, erosion and sediment controls, good housekeeping, material handling and waste management, preventive maintenance, quality assurance and recordkeeping, and spill and leak prevention and response. The CEQA Proposed Project and the CEQA Reduced Density Alternative would be subject to the NPDES C.3 requirements, which require stormwater to be treated prior to being discharged to San Francisco Bay. To treat stormwater discharges from the Project Site, the CEQA Proposed Project and the CEQA Reduced Density Alternative would incorporate a variety of stormwater treatment methods, including bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells.[44] In addition, the proposed open space would incorporate bioretention areas along the Promenade within the Central Green and a self-treating lawn area, also within the Central Green. Street stormwater runoff would be treated with flow-through planters.

2.3.6.5 Energy

Under the CEQA Proposed Project and the CEQA Reduced Density Alternative, all new building systems (e.g., HVAC, mechanical systems) would be supplied by electricity, eliminating the need for connections to PG&E's natural gas infrastructure for building operations. However, gases (e.g. oxygen, CO_2, nitrogen, natural gas) may be used by tenants for research purposes in laboratories within the Research and Office Uses. The proposed laboratories would be supported through gas tanks, either within the laboratories, or at a central location within a building, or located in working yards. It is anticipated that a small amount of gases for research purposes only would be used under the CEQA Proposed Project and the CEQA Reduced Density Alternative.

Currently, the Project Site is served by PG&E, which currently provides power to NASA ARC. The existing 2.4-kilovolt (kV) switchgear located in Building 104, which currently serves infrastructure adjacent to the Project Site, would be relocated as part of the project. The switchgear would be relocated outside of the Project Site but within NASA ARC. The project would connect directly to the existing PG&E system and route an electrical duct back to the Project Site. Electrical lines would then be routed under the interior streets on the Project Site to the proposed buildings.

The CEQA Proposed Project and the CEQA Reduced Density Alternative would require the relocation and replacement of existing gas infrastructure; however, none of the proposed gas infrastructure would serve the CEQA Proposed Project and the CEQA Reduced Density Alternative. An existing gas main runs south to north through the Project Site within Dailey Road, then continues from the east side of Building 104 to Shenandoah Plaza. The gas main would be relocated to follow the alignment of Dailey Road to the intersection of Wescoat Road. It would then follow Wescoat Road east and ultimately connect to the NASA natural gas main near Building 509. In addition, the existing PG&E natural gas meter and manifold would be relocated to the connection to the existing NASA gas main along the north side of Wescoat Road near Building 509.

[44] *Silva Cells* are suspended pavement systems that prevent soil compaction around tree roots, while allowing trees to grow freely without buckling sidewalks and treating stormwater on-site.

The CEQA Proposed Project and CEQA Reduced Density Alternative would include twelve diesel emergency generators with Tier 4 Final engines installed at the Project Site to provide emergency power, offering a maximum power capacity of more than 670 brake horsepower per generator, for a total of 6 megawatts in back-up generation capacity. If either the WRF Option or the CUP Option is implemented as part of the CEQA Proposed Project, one additional diesel emergency generator would be installed at the Project Site. The emergency generators would be installed within enclosures and screened from view from interior streets and surrounding areas; the emergency generators would be installed on the roofs of the proposed buildings or in working yards. In general, periodic testing would occur for up to four hours at each generator. Generator testing would occur monthly; it is likely that multiple generators, but not all generators, would be tested on the same day. Thus, generator testing would most likely occur on multiple days each month. Generator testing would not exceed 50 hours per generator per year. Generator testing would align with Bay Area Air District standards and permitting requirements. For the purposes of this joint EIR/EIS, it is assumed each of the generators would run 150 hours per year, including 50 hours for testing and 100 hours for emergency power, consistent with Bay Area Air District–required assumptions.

In addition, the CEQA Proposed Project and the CEQA Reduced Density Alternative would include the construction and operation of PV systems and battery energy storage systems, as discussed in Section 2.3.2.7, *Sustainability Features*.

2.3.6.6 Solid Waste

The CEQA Proposed Project and the CEQA Reduced Density Alternative would contract with Recology for solid waste disposal and recycling. Once collected, solid waste and recyclables would be transported to Recology's Sunnyvale Materials Recovery and Transfer (SMaRT) station for sorting. Nonrecyclable waste from the SMaRT station would be transported to the Kirby Canyon Landfill in San José.

Throughout construction, waste would be source separated and tracked to divert it away from landfills, with a target of recycling more than 50 percent of construction and demolition waste. During operation, the project would implement waste management strategies to divert approximately 85 percent of waste from landfills.

2.3.6.7 Telecommunications

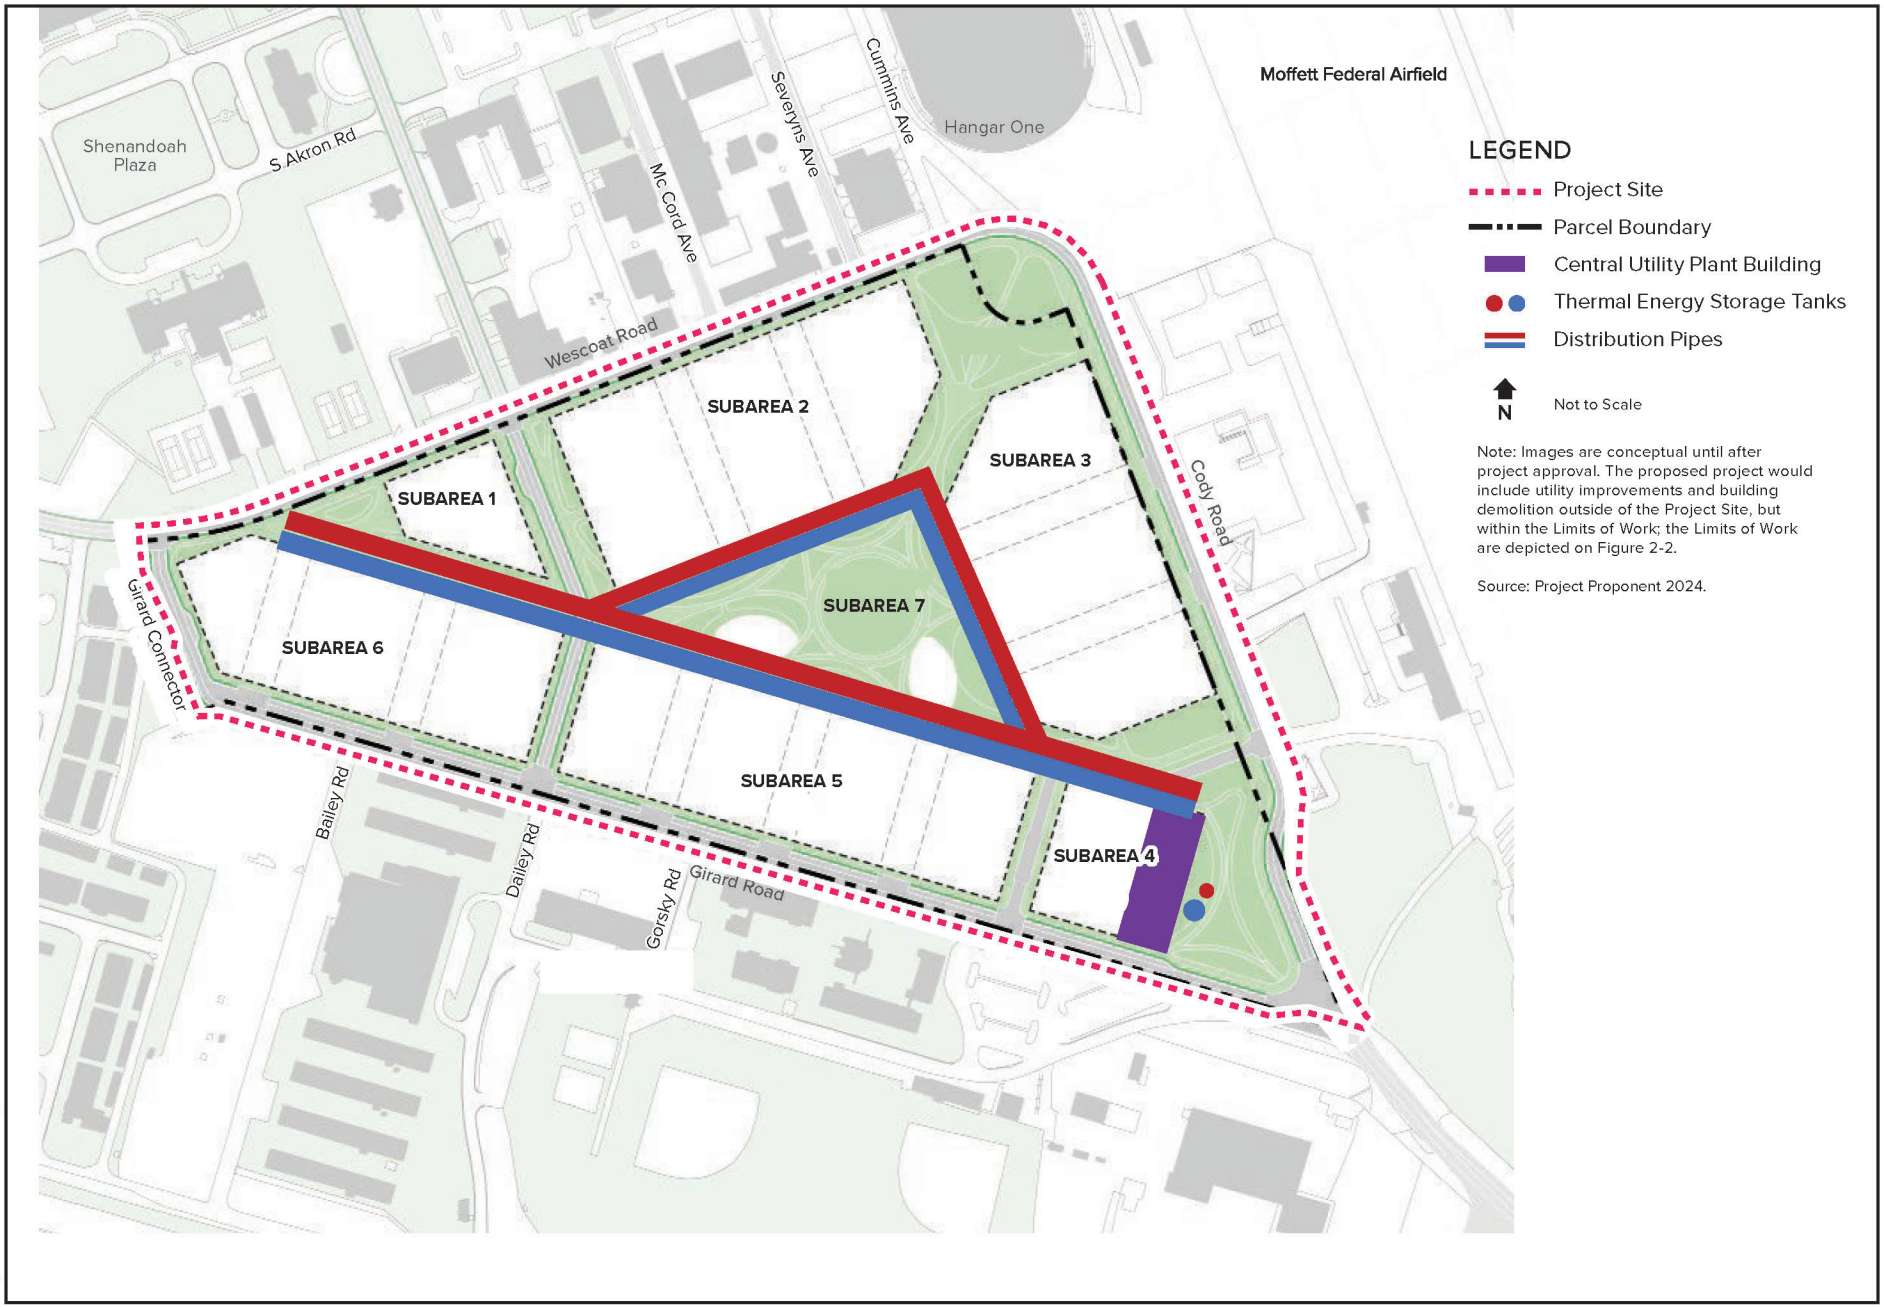
Existing NASA telecommunication lines run underneath roadways throughout the Project Site, including Dailey Road, Edquiba Road, and Wescoat Road. Existing NASA critical telecommunications infrastructure, which is subsurface, would remain in place within the Project Site. New telecommunication services to the Project Site would be connected to the existing infrastructure east of the Project Site at Ellis Street and run along Cody Road to the southeast corner of the site. The on-site telecommunication system would be built as a joint trench with electrical services and located either in the roadway or under the sidewalk.

2.3.6.8 Heating, Ventilation, and Air-Conditioning Systems

The CEQA Proposed Project and the CEQA Reduced Density Alternative would include building-by-building HVAC systems. The building-level systems would include air-source heat pumps for all heating, package air-conditioning units for cooling at buildings without office or laboratory space, and water-cooled chillers for cooling at buildings with office and/or laboratory spaces. Air filtration

for all laboratory and research and development space would meet or exceed code requirements. To comply with CALGreen code requirements (Section 160.2), building HVAC units would have an air filtration system with air filters with a designated efficiency equal to or greater than Minimum Efficiency Reporting Value (MERV) 13.

CEQA Proposed Project with the Central Utility Plant Option



Only the CEQA Proposed Project includes the CUP Option. The CUP Option would provide a centralized heating and cooling system for all buildings instead of building-by-building HVAC systems (see 2.3.6.8., *Heating, Ventilation, and Air-Conditioning Systems*). The CUP would be incorporated within the parking garage in Subarea 4, as shown in Figure 2-20, Conceptual Utilities Plan (Central Utility Plant Option). The approximately 12,600 gsf CUP would be located on the ground floor of the parking garage and have an internal floor-to-floor height of 20 feet. The square footage for the CUP building would result in a larger building area at Subarea 4, but the building area would not be considered occupiable space due to its mechanical use. The CUP building would fit within the maximum height of the parking garage proposed under the project. The CUP would require additional equipment on the roof deck of the parking structure compared to the CEQA Proposed Project without the CUP Option; the equipment would be screened from public view at ground level, with a limited number of minor protrusions allowed for exhaust fans and other small appurtenances.

The CUP system would include a four-pipe heating and cooling system with thermal energy storage (TES) tanks, as shown in Figure 2-20. In addition, the CUP system would comprise air-source heating pumps, heat recovery chillers, and water-cooled chillers. The distribution system would loop around Subarea 7, with larger distribution pipes concentrated along Subareas 4, 5, and 6. The largest distribution pipe would be approximately 36 inches. As buildout occurs and demand increases, the sizes for the distribution pipe sizes would be reduced; proposed connections to buildings would range from 3 inches to 30 inches due to the variety of building demands. The two aboveground TES tanks would be located adjacent to the parking garage. The TES tanks would include a chilled water tank (approximately 55 feet in diameter and 70 feet high) and a hot-water tank (approximately 45 feet in diameter and 65 feet high). The TES tanks would be screened from public view at ground level by trees and vegetation.

The CUP system, including the TES tanks, would be constructed during Phase 1 of construction (see Section 2.3.4.3, *Schedule and Phasing*) and initially screened from public view per the proposed Development Guidelines (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*). Additional equipment would be installed as needed during future phases to meet the demands of the buildings as they are constructed and become operational. Similar to other utility infrastructure that would be installed as part of the project, connections to the CUP system would be provided for each building at the time the building is constructed. The CUP system would be all electric.

The CUP Option would require excavation to 11 feet bgs for the distribution pipes, which would be greater than the excavation for typical utility improvements that would otherwise be required for the CEQA Proposed Project (see Section 2.3.4.2, *Ground Disturbance and Excavation*).

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

Berkeley Space Center at NASA Research Park

2.3.7 Off-Site Utility Improvements and Demolition

Implementation of the proposed project would include demolition of all existing buildings within the Limits of Work. In addition, as discussed above, the proposed project also includes Off-Site Areas consisting of utility improvements and building demolition. Together, the Project Site and the Off-Site Areas comprise the Limits of Work, as depicted on Figure 2-2 and as more fully described below.

As part of the CEQA Proposed Project and the CEQA Reduced Density Alternative, certain off-site utility improvements may be constructed within the limits of Zook Road, Cummins Avenue, Wescoat Road, Bailey Road, Perimeter Road, Cody Road, Clark Road, and Moffett Boulevard, dependent on utility layout options selected and to the extent feasible (i.e., where the improvements would not be physically prevented by other existing utilities or physical constraints), as described in Section 2.3.6, Utilities. Any off-site utility improvements required for the CEQA Proposed Project and the CEQA Reduced Density Alternative would be subject to review and approval by NASA (for work within NASA jurisdiction) and/or potentially other landowners or entities with jurisdiction. In addition, as part of the CEQA Proposed Project and the CEQA Reduced Density Alternative, existing Buildings 543, 583A, 583C, 547E, and 944 would be demolished to accommodate the proposed off-site utility improvements and realignment of Girard Road.

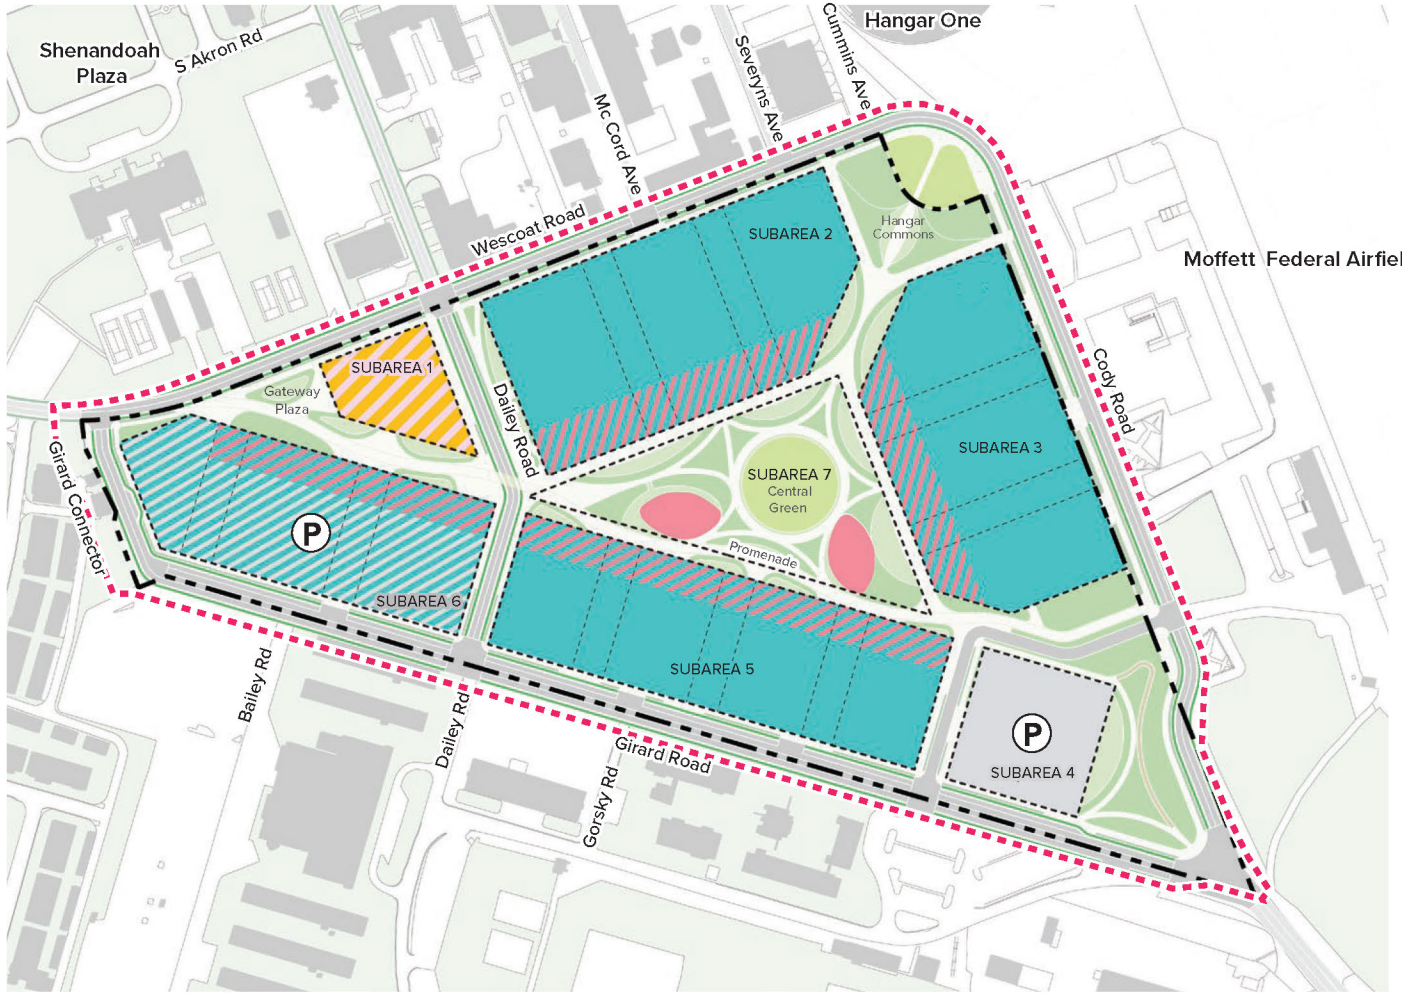
2.4 Description of the No Student/Faculty Housing Variant/Sub-Alternative

The Project Proponent has identified one variant/sub-alternative that includes certain project features that are different from those of the CEQA Proposed Project and CEQA Reduced Density Alternative: the No Student/Faculty Housing Variant/Sub-Alternative (Variant).[45] Both the CEQA Proposed Project and the CEQA Reduced Density Alternative include the Variant. The Variant would replace the 130,000 square feet of Student/Faculty Housing in Subarea 6 with 130,000 square feet of Research and Office Uses under both the CEQA Proposed Project and CEQA Reduced Density Alternative. Specifically, the Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses. The Variant would have the same type of land uses; the same general site plan; the same maximum building height; the same amount of Conference Uses, Active Uses, Short-Term Lodging, and open space; the same number of guests; the same roadway infrastructure; the same utility infrastructure; the same parking ratio; and the same construction activities proposed and evaluated under the CEQA Proposed Project and CEQA Reduced Density Alternative, unless otherwise noted below. Because the amount of Research and Office Uses and the number of Student/Faculty Housing units would be different under the Variant, the number of bicycle parking spaces, and the number of residents, employees, and students would likewise change.

The types of land uses shown in Figure 2-21, Conceptual Land Use Plan (No Student/Faculty Housing Variant), would be the same for the Variant under the CEQA Proposed Project and the CEQA Reduced Density Alternative. Similar to the CEQA Proposed Project and the CEQA Reduced Density Alternative, the proposed buildings under the Variant would have a maximum height of approximately 80 feet, with an exceedance of up to 25 feet (i.e., approximately 105 feet in total)

[45] Throughout this joint EIR/EIS, *Variant* refers to both the Variant (under CEQA) and the Sub-Alternative (under NEPA).

allowed for mechanical screens and a limited number of minor protrusions allowed for exhaust fans and other small appurtenances. Tables 2-14 and 2-15 provide a summary of the maximum square footage of proposed land uses for the CEQA Proposed Project with Variant and the CEQA Reduced Density Alternative with the Variant, respectively.



The number of Short-Term Lodging units would be the same for the CEQA Proposed Project and the CEQA Reduced Density Alternative; thus, the on-site population for this use would be the same for the CEQA Proposed Project or the CEQA Reduced Density Alternative with the Variant, as shown in Table 2-16. The Variant would result in approximately 200 Short-Term Lodging guests and no residents under the CEQA Proposed Project and the CEQA Reduced Density Alternative.

The CEQA Proposed Project with the Variant would result in more employees and students than the CEQA Reduced Density Alternative with the Variant because the CEQA Proposed Project with the Variant would include more square footage for Research and Office Uses, as shown in Table 2-17. The CEQA Proposed Project with the Variant and CEQA Reduced Density Alternative with the Variant would include the same amount of square footage for Conference Uses and Active Uses; thus, the on-site population for these uses would be the same, as shown in Table 2-17. Accounting for the 42 existing employees who would no longer work at the Project Site with implementation of the Variant, the CEQA Proposed Project with the Variant would result in approximately 6,518 net new employees and students, whereas the CEQA Proposed Project would result in approximately 6,132 net new employees and students. The CEQA Reduced Density Alternative with the Variant would result in approximately 3,770 net new employees and students, whereas the CEQA Reduced Density Alternative would result in approximately 3,384 net new employees and students.

The Variant would not change the basic characteristics of the CEQA Proposed Project and the CEQA Reduced Density Alternative. The Variant would provide flexibility in the project's design, would occur in the same Limits of Work as the CEQA Proposed Project and the CEQA Reduced Density Alternative, and would have the same objectives, purpose and need, background, and development controls, but with specific differences. Additionally, even with the removal of Student/Faculty Housing as part of the Variant, like the CEQA Proposed Project and the CEQA Reduced Density Alternative, the Variant would still meet the criteria of a TPA as described in Section 2.3.5.9, *Transit Priority Areas*. The Variant is a variation of a component of the CEQA Proposed Project and the CEQA Reduced Density Alternative.

This potential difference in proposed land use is identified as a variant because it may or may not be included as part of the project during implementation. The Project Proponent will decide whether to implement the Variant prior to construction of buildings within Subarea 6. The Variant is not an "alternative" within the meaning of CEQA. Rather, the Variant is considered a potential alteration to the CEQA Proposed Project and the CEQA Reduced Density Alternative, as described in this chapter. The final decision as to whether to adopt the CEQA Proposed Project and the CEQA Reduced Density Alternative with or without the No Student/Faculty Housing Variant will be made after completion of the final joint EIR/EIS.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

Note: Images are conceptual until after project approval. The proposed project would include utility improvements and building demolition outside of the Project Site, but within the Limits of Work; the Limits of Work are depicted on Figure 2-2. The parcel boundary includes the leased premises; it is provided for informational purposes only.

2.5 Reviews and Approvals by Lead Agencies, Responsible Agencies, and Other Agencies

UC Berkeley is part of the University of California, a constitutionally created entity of the State of California (State), with "full powers of organization and government" (California Constitution, Article IX, Section 9). As a constitutionally created State entity, UC Berkeley is not subject to the municipal regulations of local governments (e.g., general plans or zoning ordinances) for uses on property owned or controlled by UC Berkeley that are in furtherance of UC Berkeley's educational mission. Similarly, as a federal agency, NASA is not subject to the jurisdiction of regulations at the city, county, or State level, unless that authority is explicitly authorized by federal law or NASA policy or otherwise delegated by the federal government to the State for implementation and enforcement. For these reasons, the local land use regulations discussed in Section 2.2.3, *Land Use Designations*, not applicable to the CEQA Proposed Project or the CEQA Reduced Density Alternative are presented are for informational purposes only.

This section describes the approvals and permits by the Lead Agencies as well as the reviews and approvals by Responsible Agencies and Other Agencies.

2.5.1 UC Regents Approvals

Section 1.3.1.3, *CEQA Final EIR/EIS and Consideration of Project Approval*, in Chapter 1, *Introduction*, of this joint EIR/EIS describes the process by which the UC Regents will consider the project for approval. The joint Final EIR/EIS (consisting of the joint Draft EIR/EIS and the responses to comments) will be considered by the UC Regents to certify the joint Final EIR/EIS and then approve or deny the proposed project application. The Project Proponent will require authorization from the UC Regents to proceed with the proposed project under CEQA. The UC Regents is the CEQA Lead Agency for the proposed project and would provide authorization before the proposed action is submitted for NASA's approval. UC Berkeley Physical and Environmental Planning is the office of record for UC Berkeley's environmental documentation.

2.5.2 NASA Permits and Approvals

Section 1.3.2.3, *NEPA Final EIR/EIS and Consideration of Project Approval*, in Chapter 1, *Introduction*, describes the process by which NASA will consider the project for approval. The Project Proponent will require NASA's approval to proceed following analysis consistent with NEPA. NASA is the NEPA Lead Agency for the proposed action and, as the Authority Having Jurisdiction, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. After the Final EIS is published, NASA will prepare a ROD explaining why NASA has chosen to undertake a proposed action, identifying what the proposed action is, and any mitigation identified in the EIR/EIS that NASA is including. NASA is the final decision-making body regarding the project-specific discretionary development entitlements.

Reviews and permits from NASA that are anticipated to be required for the CEQA Proposed Project and the CEQA Reduced Density Alternative include, but are not limited to, the following:

- Design review by NASA pursuant to APR 8822.1 (see Section 2.3.1, *Proposed Berkeley Space Center Master Plan and Proposed Berkeley Space Center Development Guidelines*); and
- Construction Permitting by NASA pursuant to APD 8829.1.

2.5.3 Reviews and Approvals by Responsible Agencies and Other Agencies

Permits and other approvals related to state and federal requirements anticipated to be required for the CEQA Proposed Project and the CEQA Reduced Density Alternative include, but are not limited to, the following:

- Bay Area Air District permit for stationary sources;
- San Francisco Bay RWQCB Clean Water Act Section 401 water quality certification;
- U.S. Army Corps of Engineers permit under Section 404 of the Clean Water Act;
- Army approval of easements for utility infrastructure;
- Consultation pursuant to Section 7 of the federal Endangered Species Act with the U.S. Fish and Wildlife Service;
- Consultation pursuant to Section 106 of the National Historic Preservation Act (NHPA) and CEQA;
- Approval of the EPA and San Francisco Bay RWQCB for relocation or removal of any remediation system components;
- Approval of the EPA and San Francisco Bay RWQCB for the Spring 2026 project-specific EIMP;
- State Water Resources Control Board Division of Drinking Water (DDW) Application and Report of Waste Discharge (ROWD) for coverage under Order WQ 2014-0153-DWQ, and Compliance with the California Code of Regulations (CCR) Title 22 for production, distribution and use of recycled water;
- Reviews and permits associated with services to be provided by local service providers, such as the City of Mountain View, for utilities;
- Encroachment permit or similar for any roadway in City of Mountain View, City of Sunnyvale, VTA, or California Department of Transportation (Caltrans) rights-of-way; and
- Completion of a Settlement Agreement and Covenant Not to Sue with the EPA.

Chapter 3
Affected Environment/Environmental Setting and Environmental Impacts

This chapter describes the affected environment/environmental setting and potential environmental impacts that the Berkeley Space Center at NASA Research Park (proposed project/proposed action) could have on existing environmental conditions for each resource topic or environmental issue evaluated in this joint environmental impact report/environmental impact statement (EIR/EIS). Descriptions of the affected environment/environmental setting and impacts for each resource topic are provided in the 18 sections that make up Chapter 3 of this joint EIR/EIS. The environmental analysis in this chapter has been prepared in accordance with the California Environmental Quality Act (CEQA), as amended (Public Resources Code Section 21000, et seq.). A discussion of project impacts in accordance with NEPA is provided separately in Chapter 4, *Environmental Impact Statement.*

3.1 Introduction

As required by CEQA, State CEQA Guidelines Section 15125, and the National Environmental Policy Act (NEPA), this joint EIR/EIS provides a description of the affected environment/environmental setting, focusing on resources and conditions potentially subject to impacts as a result of the proposed project.

This chapter addresses the affected environment/environmental setting associated with the proposed project in relation to the following resource topic sections:

- Section 3.2, *Aesthetics and Visual Resources*
- Section 3.3, *Air Quality*
- Section 3.4, *Biological Resources*
- Section 3.5, *Cultural Resources*
- Section 3.6, *Energy*
- Section 3.7, *Geology, Soils, and Paleontological Resources*
- Section 3.8, *Greenhouse Gas Emissions*
- Section 3.9, *Hazards and Hazardous Materials*
- Section 3.10, *Hydrology and Water Quality*
- Section 3.11, *Land Use and Planning*
- Section 3.12, *Noise*
- Section 3.13, *Population and Housing*
- Section 3.14, *Public Services*
- Section 3.15, *Recreation*
- Section 3.16, *Transportation and Traffic*
- Section 3.17, *Tribal Cultural Resources*
- Section 3.18, *Utility and Service Systems*
- Section 3.19, *Effects Not Found to Be Significant (Aesthetics and Vehicular Parking, Agriculture and Forestry Resources, Mineral Resources, and Wildfire)*

3.1.1 Organization of This Chapter

Each resource topic or environmental issue in this chapter is given its own section, and each section contains the subsections listed below.

- **Affected Environment/Environmental Setting**—This describes existing baseline conditions, including the environmental context and background, to the extent needed to understand the environmental impacts of the proposed project.
- **Plans, Policies, and Regulations**—This summarizes plans, policies, and regulations considered in the analysis of the project's potential impacts on each resource topic.

  UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance.

  Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies.
- **Impacts and Mitigation Measures**—This describes the physical environmental impacts of the proposed project for each resource topic, as well as any mitigation measures that could reduce potentially significant impacts to less-than-significant levels. This section begins with a listing of the significance criteria, referred to as thresholds of significance, used to assess the severity of the environmental impacts for that particular resource topic based on Appendix G of the State CEQA Guidelines. This section also includes a topic-specific "Methods for Analysis" description explaining the parameters, assumptions, and data used to inform the analysis.

3.1.2 CEQA Methodology

State CEQA Guidelines Section 15151 provides guidance for preparation of an adequate environmental impact report (EIR):

- An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information that enables them to make a decision that intelligently takes account of the environmental consequences of a project.

- An evaluation of the environmental impacts of a project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible.
- Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. (The courts have looked not for perfection but for adequacy, completeness, and a good-faith effort at full disclosure.)

In practice, this guidance suggests that EIR preparers should adopt a reasonable methodology upon which to estimate impacts and make reasonable assumptions, using the best information available.

Pursuant to State CEQA Guidelines Section 15161, this is a project-level EIR. It serves to provide environmental clearance for the proposed project and support all necessary approvals and entitlements. For purposes of the EIR analysis, the following are evaluated within Chapter 3:

- CEQA Proposed Project (NEPA Build Alternative 1)
- CEQA Reduced Density Alternative (NEPA Build Alternative 2)

3.1.3 No Student/Faculty Housing Variant/Sub-Alternative

The Project Proponent has identified one variant/sub-alternative that includes certain project features that are different from those of the CEQA Proposed Project and CEQA Reduced Density Alternative: the No Student/Faculty Housing Variant/Sub-Alternative (Variant). For purposes of the EIR analysis, the following are evaluated within Chapter 3 in addition to the CEQA Proposed Project and the CEQA Reduced Density Alternative:

- CEQA Proposed Project with No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)
- CEQA Reduced Density Alternative with No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

For some resource areas, the impacts under the Variant would be the same as those under the CEQA Proposed Project or CEQA Reduced Density Alternative. For those resources, further analysis is not needed, as explained within the respective resource sections. However, in some cases, the impacts under the Variant would differ from the impacts identified for the CEQA Proposed Project or CEQA Reduced Density Alternative. The differences between the CEQA Proposed Project, the CEQA Proposed Project with the Variant, the CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant are analyzed quantitatively throughout this chapter, as applicable. Unless otherwise stated, all mitigation measures described in Chapter 3 required to reduce impacts associated with the CEQA Proposed Project or CEQA Reduced Density Alternative would be applicable to the CEQA Proposed Project with the Variant and the CEQA Reduced Density Alternative with the Variant.

3.1.4 Mitigation Measures

If the Draft EIR analysis determines that a significant impact would occur, the impact is classified as significant, and mitigation measures are identified to reduce, eliminate, or avoid the adverse effect. Mitigation measures identified in this Draft EIR were developed in accordance with State CEQA Guidelines Section 15126.4(a)(1)(A), which states:

> The discussion of mitigation measures shall distinguish between measures that are proposed by project proponents to be included in a project and other measures proposed by the lead, responsible, or trustee agency or other persons that were not included but the agency determines could reasonably be expected to reduce adverse impacts if required as conditions of approving the project. This discussion shall identify mitigation measures for each significant environmental effect identified in the EIR.

In this joint EIR/EIS, mitigation measures are provided immediately following each significant or potentially significant impact. Project-specific mitigation measures are numbered and lettered to correspond to their impact number. For example, Mitigation Measures AQ-1, AQ-2, and AQ-3 refer to the first mitigation measures in Section 3.3, *Air Quality,* of this joint EIR/EIS. In addition, where applicable, the terms "CEQA-only" in this chapter, or "NEPA-only" in Chapter 4, *Environmental Impact Statement*, are included in the name of a mitigation measure to identify whether it is required to reduce a CEQA impact or is applicable to a NEPA impact, respectively. If no such terms are included, the mitigation measure applies to CEQA and NEPA impacts.

If the proposed project is approved by The Regents of the University of California (UC Regents), a Mitigation Monitoring and Reporting Program (MMRP) must be adopted. Pursuant to State CEQA Guidelines Section 15097, an MMRP is a mechanism for monitoring and reporting revisions to a project or conditions of approval that the public agency required as mitigation to lessen or avoid a significant environmental effect. As the Authority Having Jurisdiction, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. The Project Proponent will require authorization from the UC Regents to proceed with the proposed project under the California Environmental Quality Act (CEQA) and NASA's approval to proceed following analysis consistent with the National Environmental Policy Act (NEPA).[1] The MMRP for the proposed project will identify the specific monitoring actions that will be completed, the various entities that will oversee completion of the mitigation, and a timeline for implementation of the measures. Implementation of the mitigation measures in the MMRP will eliminate or reduce the severity of the significant impacts identified in the joint EIR/EIS.

3.1.5 Significance Determinations

In accordance with State CEQA Guidelines Section 15022(a), the University of California, Berkeley uses the impact significance criteria designated by CEQA and suggested by State CEQA Guidelines Appendix G.[2] The criteria, as well as the Office of Planning and Research *Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018), are used to evaluate the impacts of the proposed project throughout this document. The criteria are listed under the subsection *Thresholds of Significance* throughout this chapter.

[1] UC Regents is a legal entity that includes all of the University of California campuses.

[2] UC Berkeley is preparing the EIR on behalf of the UC Regents.

In determining whether impacts are significant, an EIR compares the potential impacts of a project with pre-project environmental conditions. State CEQA Guidelines Sections 15125(a) and 15162.2(a) specify that the baseline normally consists of physical conditions that existed at the time the Notice of Preparation (NOP) was published or the time the environmental analysis began. With the proposed project, the NOP release date of June 21, 2024, serves as the environmental baseline from which impacts of the proposed project are generally measured. However, as noted in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, for the purposes of the analysis in this joint EIR/EIS, Open Campus conditions are accounted in baseline conditions. Specifically, the baseline for Phase 1 construction analysis (i.e., project-related activities before Phase 1 occupancy) is a typical existing-conditions baseline scenario because Open Campus improvements would not be completed yet. The baseline conditions for all operational analyses and Phases 2 to 4 construction analyses is a future baseline scenario that accounts for Open Campus improvements.

For each impact identified, a level of significance is determined, using the following classifications.

- ***No Impact***. No impact denotes situations in which there is no possibility of an adverse effect on the environment.
- ***Less than Significant***. Less-than-significant impacts are effects that are noticeable but not at a level that would exceed established or defined thresholds or effects that are already reduced to a level below such thresholds (e.g., through compliance with applicable laws or features of the project).
- ***Less than Significant with Mitigation***. Less than significant with mitigation is the conclusion when impacts would be significant or potentially significant, but implementation of project-specific mitigation measures would reduce impacts to a level of less than significant.
- ***Significant and Unavoidable***. Significant and unavoidable is the conclusion if impacts are identified as significant or potentially significant, and mitigation measures would not diminish the effects to less-than-significant levels.

In this chapter, impacts are defined using an alphanumeric system that identifies the environmental topic associated with the impact. For example, Impact CEQA-CUL-1 denotes the first impact in Section 3.5, *Cultural Resources*. The abbreviated codes used to identify the environmental issues discussed in this chapter are listed below.

- AES – Aesthetics
- AQ – Air Quality
- BIO – Biological Resources
- CUL – Cultural Resources
- ENE – Energy
- GEO – Geology, Soils, and Paleontology
- GHG – Greenhouse Gases
- HAZ – Hazards and Hazardous Materials
- HYD – Hydrology and Water Quality
- LU – Land Use and Planning
- NOI – Noise and Vibration
- POP – Population and Housing
- PS – Public Services
- REC – Recreation
- TRAN – Transportation and Traffic
- TCR – Tribal Cultural Resources
- UTIL – Utility and Service Systems

3.1.6 Approach to Cumulative Impacts Analysis

State CEQA Guidelines Section 15355 defines cumulative impacts. In addition, State CEQA Guidelines Section 15130(b)(1) sets forth the two primary approaches to the analysis of cumulative impacts that are used in this Draft EIR. The cumulative analysis can be based on (1) a list of past, present, and reasonably anticipated future projects producing related impacts that could combine with those of a proposed project or (2) a summary of a projection contained in a general plan or related planning document.

The methodology used depends on which approach accurately captures the cumulative context for the resource topic being analyzed. An introductory statement that defines the cumulative geographic context being analyzed and whether the approach is list based or projections based is included at the beginning of each cumulative impacts section.

3.1.6.1 Projections-Based Approach

Where the cumulative analysis relies on a projections-based approach, the projections identified for NASA ARC, the City of Sunnyvale, the City of Mountain View, and/or Santa Clara County are used. The summary of the projections provided below is based on a review of each jurisdiction's land use development plans.

NASA Ames Development Plan (NADP)[3]

- 1,930 residential units
- 4,909 residents
- 7,088 employees

Sunnyvale General Plan (Buildout 2035) + Housing Element Update (Buildout 2040)[4]

- 17,158 residential units
- 222,210 residents
- 108,640 jobs

Mountain View General Plan (Buildout 2030) + Housing Element Update (Buildout 2040)[5]

- 70,100 residential units
- 148,200 residents
- 133,000 jobs

[3] NASA. 2025. *Berkeley Space Center at NASA Research Park—NASA ARC Buildout Assumptions*. The CEQA Reduced Density Alternative is included within the assumptions evaluated in the 2002 PEIS.

[4] City of Sunnyvale. 2023. *Initial Study/Proposed Negative Declaration, 2023–2031 Housing Element Update*. October 2023.

[5] City of Mountain View. 2022. *City of Mountain View Housing Element Update, Response to Comments/Final Environmental Impact Repor*t. November 2022.

County of Santa Clara General Plan (Buildout 2010) + Housing Element update (Buildout 2040)[6]

- 881,655 residential units
- 2,538,320 residents
- 1,478,600 jobs

3.1.6.2 List-Based Approach

Where the cumulative analysis relies on a list-based approach, a list of projects that are currently proposed, approved, or under development within NASA ARC at the approximate time of the NOP release date of June 21, 2024 is used. Table 3.1-1 summarizes projects that are currently proposed, approved, or under development in NASA ARC (i.e., the cumulative projects) and Figure 3.1-1 depicts the locations of the cumulative projects. Cumulative Projects 1 through 5 include individual development projects in NASA ARC. Cumulative Projects 6 through 11 include the remaining developable area programmed in the NADP for NASA ARC that has not been allocated towards any current projects. Cumulative Projects 6 through 11 are grouped by land use type within the four areas at NASA ARC (i.e., NRP, Eastside/Airfield, Bay View, and Ames Campus). Cumulative Projects 12 through 18 include projects at Moffett Air National Guard Base.

The cumulative analysis for each topic in Section 3.2, *Aesthetics*, through Section 3.18, *Utility and Service Systems*, identifies which projects (if any) in Table 3.1-1 have the potential to combine with the proposed project and result in a cumulative impact, based on characteristics such as distance from the Project Site and the project type. The identified projects are considered in the cumulative analysis.

6 County of Santa Clara. 2023. *Santa Clara County Housing Element and Stanford Community Plan Update Draft Environmental Impact Repor*t. June 2023.

Notes:

sf= square feet; n/a = not available

1 This list is current as of December 2025 and includes projects at NASA ARC.

2 For the projects at the Moffett Air National Guard Base, only projects that could combine with the proposed project to contribute to a cumulative impact are included in this table.

3 NASA is currently in the process of updating the NASA Ames Master Plan. However, the plan is in the preliminary planning stages and not enough details about the plan are known at this time. Therefore, the Ames Master Plan updates is not included as an identified cumulative project in this list.

4 This total includes storage uses.

5 This total includes factory and storage uses.

6 This total includes space for a bus fleet maintenance facility.

7 This total includes public uses.

8 This total includes a mix of office and high-density R&D uses.

9 This total includes a mix of technical, low-density office, and R&D uses.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

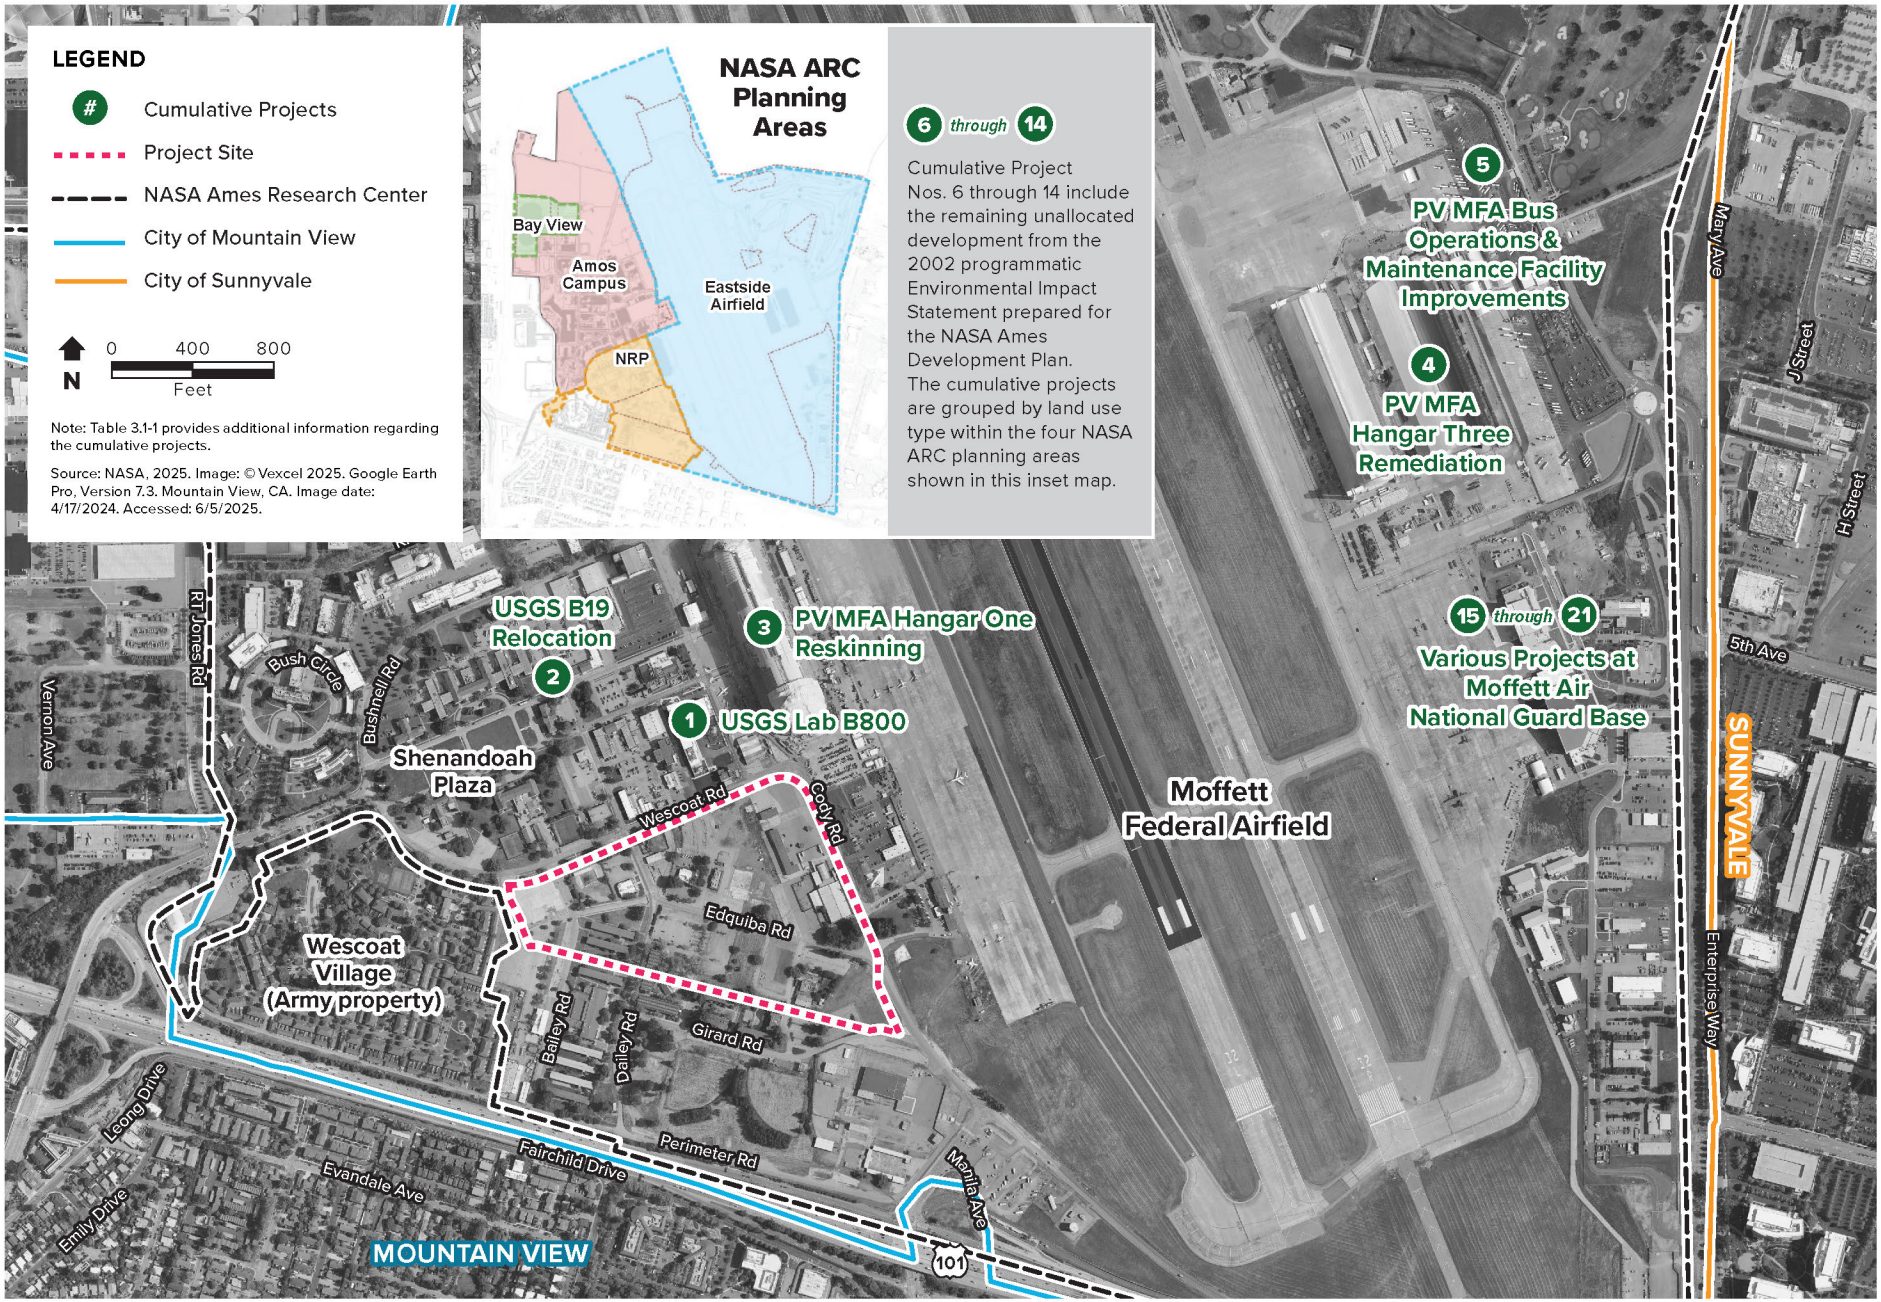

Figure 3.1-1
Cumulative Projects
Berkeley Space Center at NASA Research Park

3.2 Aesthetics and Visual Resources

For purposes of CEQA for the Berkeley Space Center at NASA Research Park (proposed project/proposed action), aesthetics and visual resources are not considered for environmental impacts. In accordance with Senate Bill (SB) 743, aesthetics and parking impacts shall not be considered in determining if a project has the potential to result in significant environmental effects, provided the project meets the following criteria under Public Resources Code Section 21099, Modernization of Transportation Analysis for Transit-Oriented Projects:

- The project is on an infill site,
- The project is in a Transit Priority Area (TPA), and
- The project is a residential, mixed-use residential, or employment-center project.

An infill site is a lot located within an urban area that has been previously developed or a vacant site where at least 75 percent of the perimeter of the site adjoins or is separated only by an improved public right-of-way from parcels that are developed with qualified urban uses (Public Resources Code Section 21099[a][4]). A TPA is defined as an area within 0.5 mile of an existing or planned major transit stop, such as a rail transit station, ferry terminal served by transit, or the intersection of two or more major bus routes (Public Resources Code Section 21099[a][7]).

The proposed project meets all of the above criteria. The Limits of Work, which include the Project Site, are currently developed with 18 buildings. The existing buildings are mostly vacant; many were formerly used as ancillary buildings that supported Navy operations. Most of the perimeter of the Project Site adjoins urban uses. The Metropolitan Transportation Commission (MTC) has identified locations for TPAs within the Bay Area. The Project Site is within a TPA because of its proximity to the Bayshore/NASA Santa Clara Valley Transportation Authority (VTA) light rail station, as shown in Figure 2-14, Transit Priority Area Map, in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, of this joint environmental impact report/environmental impact statement (EIR/EIS).[1] As discussed in Chapter 2, the proposed project meets the above criteria because it consists of an employment-center and mixed-use residential project.

Because the proposed project meets the three TPA criteria, the EIR portion of this joint EIR/EIS does not consider aesthetics or vehicular parking in determining the significance of impacts under the California Environmental Quality Act (CEQA). Appendix 3.2-1 of this joint EIR/EIS includes a discussion of the proposed project's potential changes to the visual environment; for the purposes of CEQA, this information is provided for informational purposes. Section 4.5.2, *Aesthetics and Visual Resources*, in Chapter 3, *Environmental Impact Analysis*, provides an analysis of aesthetics and visual resources required under the National Environmental Policy Act (NEPA).

3.3 Air Quality

3.3.1 Introduction

This section evaluates the potential impacts on air quality resources that could result from construction and operation of the Berkeley Space Center at the NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Project Site as well as the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical study prepared for the proposed project:

- *Berkeley Space Center at NASA Research Park Air Quality, Health Risk Assessment, and Greenhouse Gas Technical Report* (Air Quality, Health Risk, and GHG Technical Report) prepared by ICF, February 2026 (Appendix 3.3-1 of this joint environmental impact report/environmental impact statement [EIR/EIS])

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. The NOP/NOI comments pertaining to air quality resources include the following recommendations by the United States Environmental Protection Agency (EPA), Region 9.

- Identify air quality and health impacts from construction and demolition activities, including addressing potential for encountering asbestos. This issue is addressed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impacts CEQA-AIR-2 and CEQA-AIR-3 and Section 4.5.3.4, *Environmental Consequences*, under Impacts NEPA-AIR-2 and NEPA-AIR-3.
- Disclose the Project Site attainment status with the national ambient air quality standards (NAAQS), and analyze project-related emissions of particulate matter (PM), carbon monoxide (CO), nitrogen oxides (NO_X), sulfur oxides, and fugitive dust. This issue is addressed in Section 3.3.2, *Affected Environment/Environmental Setting*; Section 3.3.7, *Impacts and Mitigation Measures*, under Impact CEQA-AIR-2; and Section 4.5.3.4, *Environmental Consequences*, under Impact NEPA-AIR-2.
- Incorporate mitigation for construction- and operations-related emissions. This issue is addressed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impact CEQA-AIR-2 and Section 4.5.3.4, *Environmental Consequences*, under Impact NEPA-AIR-2.
- Identify sensitive receptors throughout and around the Project Site and disclose a strategy to reduce construction-related impacts on sensitive receptors. This issue is addressed in Section 3.3.2, *Affected Environment/Environmental Setting*; Section 3.3.7, *Impacts and Mitigation Measures*, under Impact CEQA-AIR-3; and Section 4.5.3.4, *Environmental Consequences*, under Impact NEPA-AIR-3.

The Carpenters Union Local 405 also requested analysis and mitigation (if necessary) of construction workers commuting to the Project Site. This issue is addressed under Impact CEQA-AIR-2, and under Impact NEPA-AIR-2 in Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS.

3.3.2 Affected Environment/Environmental Setting

For the purposes of analyzing air quality, two geographic scales define the study area consistent with Bay Area Air District (Air District) guidance.[1] The *regional* study area is the San Francisco Bay Area Air Basin (SFBAAB) ("Regional Air Quality Study Area"); the *local* study area is the Project Site plus areas within 1,000 feet of the Project Site ("Local Air Quality Study Area"). These study areas encompass the areas directly and indirectly affected by construction and operation of the proposed project.

3.3.2.1 Criteria Pollutants

Criteria pollutants make up a group of six common air pollutants for which the federal government and the State of California have set NAAQS and California ambient air quality standards (CAAQS), respectively. Criteria pollutants are defined as ozone, CO, lead (Pb), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and PM, which consists of particulates 10 microns in diameter or less (PM_{10}) and 2.5 microns in diameter or less ($PM_{2.5}$). Ozone is considered a regional pollutant because its precursors affect air quality on a regional scale. NO_X and reactive organic gases (ROG) react photochemically to form ozone. This reaction occurs at some distance downwind of the emissions source. Pollutants such as CO, NO_2, SO_2, and Pb are considered local pollutants. They tend to accumulate in the air locally. PM is both a local and a regional pollutant.

Concentrations of criteria pollutants are commonly used indicators of ambient air quality. Criteria pollutant concentrations can be used to determine acceptable levels of exposure. The ambient air quality standards for these pollutants are set with an adequate margin of safety for public health and the environment (Clean Air Act [CAA] Section 109). Epidemiological, controlled human exposure, and toxicology studies evaluate potential health and environmental effects of criteria pollutants and form the scientific basis for new and revised ambient air quality standards.

Table 3.3-1 provides a brief description of the sources and potential effects of the six criteria pollutants. The primary criteria pollutants generated by the proposed project would be ozone precursors (NO_X and ROG), CO, SO_2, and PM.[2,3] Additional narrative on the sources and health effects of these pollutants is provided in the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. The Air Quality, Health Risk, and GHG Technical Report also summarizes the most recent criteria pollutant emissions inventory for the SFBAAB.

1 Bay Area Air District. 2023. *California Environmental Quality Act Air Quality Guidelines*. April.

2 Pb is also a criteria pollutant. The project would not introduce new sources of Pb and would handle existing Pb (mainly in old paint) according to state and federal requirements. There are state standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particulates. However, these pollutants are typically associated with industrial sources, which are not included as part of the proposed project. Accordingly, they are not evaluated further.

3 Most emissions of NO_X are in the form of nitric oxide (NO). Conversion to NO_2 occurs in the atmosphere as pollutants disperse downwind. Accordingly, NO_2 is not considered a local pollutant of concern for the project and is not evaluated further.

Table 3.3-1. Sources and Potential Health and Environmental Effects of Criteria Pollutants

Pollutant	Primary Sources	Potential Effects [a]
Ozone	Formed by a chemical reaction between ROG and NO_X in the presence of sunlight. Primary sources of ROG and NO_X are vehicle exhaust, industrial combustion processes, gasoline storage and transport, solvents, paints, and landfills.	Inflammation of mucous membranes and airways in lungs; wheezing; coughing, along with pain when inhaling deeply; decreased lung capacity; aggravation of lung and heart problems; reduced crop yields; and damage to plants, rubber, some textiles, and dyes.
Particulate matter (PM)	Power plants, steel mills, chemical plants, unpaved roads and parking lots, wood-burning stoves and fireplaces, equipment, and vehicles.	Irritation of airways, coughing, or difficulty breathing; aggravated asthma; development of chronic bronchitis; irregular heartbeat; nonfatal heart attacks; and premature death in people with heart or lung disease. Impairs visibility (haze).
Carbon monoxide (CO)	A component of combustion-engine exhaust that is formed when carbon in fuel is not burned completely.	Reduced ability of blood to deliver oxygen to vital tissues, affecting the cardiovascular and nervous system. Impaired vision and dizziness that can lead to unconsciousness or death.
Nitrogen dioxide (NO_2)	Motor vehicles, electric utilities, and other sources that burn fuel.	Aggravation of lung and heart problems. Precursor to ozone and acid rain. Contributes to global warming and nutrient overloading, which deteriorates water quality. Brown discoloration of the atmosphere.
Sulfur dioxide (SO_2)	Petroleum refineries, cement manufacturing processes, metal processing facilities, locomotives, large ships, and fuel combustion in diesel engines.	Aggravation of lung and heart problems. Converts to sulfuric acid, which can damage marble, iron, and steel. Damage to crops and natural vegetation. Impaired visibility.
Lead (Pb)	Metal refineries, smelters, battery manufacturers, iron and steel producers, and racing and aircraft industries that use leaded fuels.	Anemia; damage to the kidneys, liver, brain, reproductive and nervous systems, and other organs; and neurological problems, including learning deficits and lowered IQ. Affects animals, plants, and aquatic ecosystems.

Source: California Air Resources Board. 2026. Criteria Pollutants. Available: https://ww2.arb.ca.gov/criteria-pollutants. Accessed: March 17, 2026.
IQ = intelligence quotient; NO_X = nitrogen oxides; ROG = reactive organic gases
[a] The health effects described in this table may occur at certain concentrations among certain members of the public. The specific concentrations at which health effects are observed depends on the pollutant (e.g., ozone, PM_{10}), an individual's sensitivity, level of exertion (i.e., breathing rate), and duration of exposure.

3.3.2.2 Toxic Air Contaminants

Toxic air contaminants (TAC)[4] are pollutants that may or contribute to an increased risk of mortality or serious illness. For TACs that are known or suspected carcinogens, the California Air Resources Board (CARB) has consistently found that there are no levels or thresholds below which exposure is risk free. Individual TACs vary greatly in the risks they present. At a given level of exposure, one TAC

[4] TAC is synonymous with hazardous air pollutants (HAP); both terms are used in this document.

may pose a hazard that is many times greater than another. TACs are identified and their toxicity is studied by the California Office of Environmental Health Hazard Assessment (OEHHA). The primary TACs of concern associated with the proposed project are diesel particulate matter (DPM), asbestos, trichloroethene, tetrachloroethene, 1,2-dichloroethene, vinyl chloride, and 1,1-dichloroethane. The latter five pollutants were identified by EPA as the risk-based site-specific cleanup levels, with trichloroethene to be used as an indicator compound to track remediation progress.[5]

Table 3.3-2 provides a brief description of the sources and health effects of the seven primary TACs of concern associated with the proposed project. Additional narrative on the sources and health effects of these pollutants is provided in the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/ EIS.

Table 3.3-2. Sources and Potential Health and Environmental Effects of Project TACs

Pollutant	Primary Sources	Potential Effects
Diesel particulate matter (DPM)	Generated by diesel-fueled equipment and vehicles.	Short-term exposure can cause acute irritation (e.g., eye, throat, bronchial), neurophysiological symptoms (e.g., lightheadedness, nausea), and respiratory symptoms (e.g., coughing, phlegm). DPM is classified as carcinogenic to humans.
Asbestos	Naturally occurring fibrous silicate minerals found in ultramafic rock that has undergone partial or complete alteration to serpentine rock (or serpentinite) and often contains chrysotile asbestos. Previously used as insulation and fireproofing in buildings.	Inflammation of the lungs, respiratory ailments (e.g., asbestosis, which is scarring of lung tissue that results in constricted breathing), and cancer (e.g., lung cancer and mesothelioma, which is cancer of the linings of the lungs and abdomen).
Trichloroethene (TCE)	Human-made chemical that can be found in contaminated groundwater and soil.	Affects to liver, nervous and immune systems, lungs, and kidneys, and the brain. Link to fetal development issues. Long-term exposure can increase the risk of developing kidney cancer and non-Hodgkin lymphoma.
Tetrachloroethene (PCE)	Human-made chemical used in dry cleaning and textile processing, metal degreasing, and other consumer and industrial applications. It can be found in contaminated groundwater and soil.	Affects nervous and respiratory systems, eyes, liver, and kidneys. Suspected carcinogen based on the development of liver tumors in mice and kidney tumors in male rats.
1,2-Dichloroethene (1,2-DCE)	Human-made chemical used as a solvent for gums, waxes, oils, and fats. It can be found in contaminated groundwater and soil.	Affects nervous system, liver, kidneys, and lungs. Skin and eye irritant.
Vinyl chloride	Human-made chemical used to produce polyvinyl chloride plastic that can be found in contaminated groundwater and soil.	Affects nervous and cardiovascular systems. Link to fetal development issues. Vinyl chloride is classified as carcinogenic to humans.

3.3.2.3 Regional Air Quality Setting

Although the primary factors that determine air quality are the locations of air pollutant sources and the amount of pollutants emitted from those sources, meteorological conditions and topography are also important factors. Atmospheric conditions, such as wind speed, wind direction, and air temperature gradients, interact with the physical features of the landscape to determine the movement and dispersal of air pollutants. Unique geographic features throughout the state define 15 air basins with distinctive regional climates. The proposed project is in the SFBAAB.

Climate in the SFBAAB is affected by the marine air flow and the basin's proximity to the San Francisco Bay Area and terrain. Within the Santa Clara Valley subregion, temperatures are relatively consistent throughout the year, and prevailing winds flow from the northwest to southeast. Wind speeds are greatest in the spring and summer and weakest in the fall and winter. These summer winds can transport ozone precursors from surrounding counties to the Santa Clara Valley, where they concentrate in the southeast. High summer temperatures and stable air also promote ozone formation, which can be recirculated by southerly drainage flows in the late evening and early morning and the prevailing north-westerlies in the afternoon. A similar recirculation pattern occurs in the winter, affecting levels of CO and PM. This movement of the air up and down the valley increases the impact of the pollutants significantly.[6]

Based on existing air quality conditions, the SFBAAB and counties within the air basin are designated by EPA and CARB as nonattainment, maintenance, attainment, or unclassified for the NAAQS and CAAQS. The four designations are further defined as:

- **Nonattainment**—areas where monitored pollutant concentrations consistently violate the standard in question

6 Bay Area Air District. 2017. *California Environmental Quality Act Air Quality Guidelines*. May.

- **Maintenance**—areas where monitored pollutant concentrations exceeded the standard in question in the past but are no longer in violation of that standard
- **Attainment**—areas where pollutant concentrations meet the standard in question over a designated period
- **Unclassified**—areas where data are insufficient for determining whether a pollutant is violating the standard in question

Table 3.3-3 summarizes the attainment status of Santa Clara County in the SFBAAB with regard to the NAAQS and CAAQS.

Table 3.3-3. Federal and State Attainment Status for Santa Clara County

Criteria Pollutant	Federal (NAAQS) Designation	State (CAAQS) Designation
Ozone (8-hour standard)	Marginal nonattainment	Nonattainment
CO	Attainment	Attainment
PM_{10}	Attainment	Nonattainment
$PM_{2.5}$	Moderate nonattainment [a]	Nonattainment
NO_2	Attainment	Attainment
SO_2	Attainment	Attainment
Lead	Attainment	Attainment
Sulfates	(no federal standard)	Attainment
Hydrogen sulfide	(no federal standard)	Unclassified
Visibility-reducing particles	(no federal standard)	Unclassified

Source: California Air Resources Board. 2025. *Maps of State and Federal Area Designations*. Available: http://www.arb.ca.gov/desig/adm/adm.htm. Accessed: April 1, 2025.

U.S. Environmental Protection Agency. 2025. Nonattainment Areas for Criteria Pollutants (Green Book). Last revised: March 31, 2025. Available: https://www.epa.gov/green-book. Accessed: April 9, 2025

Notes:

CO = carbon monoxide; NO_2 = nitrogen dioxide; $PM_{2.5}$ = particulate matter with a diameter less than or equal to 2.5 microns; PM_{10} = particulate matter with a diameter less than or equal to 10 microns; SO_2 = sulfur dioxide

[a] The EPA lowered the annual PM NAAQS on February 7, 2024 from 12 to 9 micrograms per cubic meter. CARB has submitted initial recommendations for area designations under the new standard, which include a nonattainment designation for the San Francisco Bay Area. Final designations under the revised standard are expected in February 2026.

3.3.2.4 Project Site

At Moffett Federal Airfield, which is part of the National Aeronautics and Space Administration Ames Research Center (NASA ARC), the summers are long, warm, arid, and mostly clear. The winters are short, cold, wet, and partly cloudy. The predominant wind direction is from the north northwest. The average hourly wind speed in Moffett Field experiences mild seasonal variation over the course of the year. The windier part of the year lasts for 5 months, from March to August, with average wind speeds of more than 7 miles per hour. The windiest month of the year is June, with an average hourly wind speed of almost 9 miles per hour. About a third of all hours at Moffett Field are in calm conditions (wind speed less than 2 miles per hour).[7]

[7] Proposed Berkeley Space Center Master Plan, Spring 2026. See Appendix 2-1 of this joint EIR/EIS.

The existing air quality conditions in the Local Air Quality Study Area can be characterized by ambient monitoring data. CARB collects ambient air quality data from a network of air monitoring stations throughout the state. The nearest monitoring station to the Project Site is the San José-Jackson Street monitoring station, which is approximately 9.4 miles southeast of the Project Site. Table 3.3-4 lists air quality trends from the data collected at San José-Jackson Street for the past 5 years. This station is representative of the Local Air Quality Study Area because the climate, topography, and urban setting are like those of the Local Air Quality Study Area. During the 2019 to 2023 monitoring period, exceedances were recorded at the monitoring station for the state and federal 8-hour ozone standards, state PM_{10} standards, and federal $PM_{2.5}$ standards.

Table 3.3-4. Ambient Air Quality Monitoring Data Measured at the San José-Jackson Street Station

Pollutant Standards	2019	2020	2021	2022	2023
Ozone					
Maximum 1-hour concentration (ppm)	0.095	0.106	0098	0.090	0.087
Maximum 8-hour concentration (ppm)	0.081	0.085	0.084	0.074	0.068
Measured number of days standard exceeded

Sources: California Air Resources Board. 2024. *iADAM: Air Quality Data Statistics (Top 4 Summary).* Available: https://www.arb.ca.gov/adam/topfour/topfour1.php. Accessed: May 20, 2024.

U.S. Environmental Protection Agency. 2024. *Monitor Values Report.* Available: https://www.epa.gov/outdoor-air-quality-data/monitor-values-report. Accessed: May 20, 2024.

CAAQS = California ambient air quality standards; CO = carbon monoxide; NAAQS = national ambient air quality standards; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ppb = parts per billion; ppm = parts per million; SO_2 = sulfur dioxide; > = greater than; * = not applicable or insufficient or no data available to determine the value; µg/m³ = micrograms per cubic meter

The existing health risk conditions in the Local Air Quality Study Area can be characterized by data published by OEHHA and EPA. OEHHA identifies the project census tract (06085504700) as experiencing slightly lower air pollution and secondary effects (e.g., socioeconomic) than the rest of the state. Traffic and DPM are the two most burdened exposure indicators, whereas cleanup sites and hazardous waste are the highest ranked environmental effects.[8] EPA identifies the entire Project Site as Vapor Intrusion Study Area, which refers to areas where the estimated TCE shallow groundwater concentrations exceed 5 parts per billion (ppb). Recent (2024) air sampling within the Project Site did not identify TCE or PCE levels above EPA's cleanup action levels. Likewise, outdoor and indoor air samples collected at Building 16, which is on the other side of Wescoat Road, just beyond the Limits of Work, did not show any exceedances after the Navy installed a sub-slab depressurization (SSD) at Building 16 in 2024.[9] Further discussion on Vapor Intrusion can be found in Chapter 3.9, *Hazards and Hazardous Material*, Section 3.9.2.2.

Beyond groundwater contamination, there are several stationary sources within the Local Air Quality Study Area that contribute to ambient TAC concentrations. Table 3.3-5 identifies stationary sources within 1,000 feet of the Project Site and on NASA ARC property.[10] U.S. 101 and several major roadways are also within the Local Air Quality Study Area. No rail emissions are within 1,000 feet of the Project Site. Modeling performed by the Air District indicates that the Project Site has an estimated existing cancer risk between 4.3 per million and 12.7 per million due to nearby on-road mobile sources. The annual $PM_{2.5}$ concentration due to on-road mobile sources at the Project Site is between 0.12 microgram per cubic meter (µg/m³) and 0.34 µg/m³. For both cancer risk and annual

3.3.2.5 Sensitive and Worker Receptors

The Air District defines sensitive receptors as "children, the elderly, and those with preexisting serious health problems."[12] Land uses where sensitive receptors are located and where there is reasonable expectation of continuous human exposure include "schools and schoolyards, parks and playgrounds, day-care centers and preschools, hospices, dormitories, prisons, nursing homes, hospitals, and residential communities."[13] Analyses performed by CARB indicate that providing a separation of at least 1,000 feet from diesel sources and high-traffic areas would reduce exposure to air contaminants and decrease asthma symptoms in children.[14] This CARB study demonstrates that DPM concentrations and resultant health effects decline as a function of distance from the emissions source.

The Air District defines worker receptors as off-site locations "where people work, including indoor and outdoor areas and commercial/industrial areas currently zoned or planned to be zoned for manufacturing, light or heavy industry, office, or retail activity."[15] The Air District's Guidelines note that lead agencies may elect to consider these receptors in air quality health risk assessment. UC

[15] Bay Area Air District. 2023. *California Environmental Quality Act Air Quality Guidelines*. Appendix E Recommended Methods for Screening and Modeling Local Risks and Hazards. August.

Berkeley and NASA have elected to include both existing off-site workers and future on-site workers in this analysis.

Figure 3.3-1, Receptor Types in the Local Air Quality Study Area, shows the receptor types and locations in the Local Air Quality Study Area (within 1,000 feet of the Project Site). Table 3.3-6 summarizes the number of sensitive buildings by receptor type within the Local Air Quality Study Area and identifies the nearest distance to the Project Site for each receptor type. As shown, residential uses are the most common receptor type within the Local Air Quality Study Area. Other receptor types include worker, educational, daycare, and parks. There are no senior centers, nursing homes, pre-schools, K–12 schools, or medical or institutional (i.e., prison) facilities in the Local Air Quality Study Area. According to NASA, the existing buildings south of the Project Site (and outside the Limits of Work) are currently unoccupied and are anticipated to remain unoccupied during construction of the proposed project; thus, the existing buildings south of the Project Site are not considered receptors within the Local Air Quality Study Area.[16] The proposed Student/Faculty Housing units would be constructed within Subarea 6 in Building 12 during Phase 4 (for a conceptual site plan showing the possible locations of the proposed buildings, see Figure 3.12-2 in Section 3.12, *Noise*, of this joint EIR/EIS).

Table 3.3-6. Receptor Types in the Local Air Quality Study Area

Receptor Type	Number of Buildings	Nearest Distance (feet) to Project Site
Workers – On-Site (i.e., Future Workers in On-Site Buildings, not Construction Workers)	12[a]	n/a
Workers – Off-Site (i.e., Existing and Future Workers in NASA Research Park)	42	21
Residential[b]	136	46
Worker - Undefined	15	99
Educational - University	2	283
Daycare – Church[c]	2	612
Park	1	725
Worker - Off-Site (i.e., Existing and Future Workers in NASA Ames Campus)	1	943

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Notes:

n/a = not applicable

[a] For a conceptual site plan showing the possible locations of the proposed buildings, see Figure 3.12-2 in Section 3.12, *Noise*, of this joint EIR/EIS.

[b] The garages associated with residential uses are not considered sensitive receptors.

[c] Churches are not generally considered sensitive receptors. However, the facilities (including an outbuilding) are identified because they could include an on-site daycare or play yard.

[16] According to NASA, it is anticipated that the recreational fields south of the Project Site would be used intermittently (e.g., on a weekly basis for a few hours at a time) during construction of the proposed project; thus, the sports fields are not considered sensitive receptors according to Air District CEQA Guidelines. In addition, some of the existing buildings south of the Project Site would require occasional maintenance and other intermittent activities during project construction, but would remain unoccupied.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

3.3.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance. For the purposes of CEQA, UC Berkeley has elected to use guidance from the Air District for the analysis of air quality associated with the project.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies. For the purposes of NEPA, NASA has elected to use guidance from the state and the Air District, supplemented with federal standards, as part of the analysis for air quality associated with the project.

Plans, policies, and regulations considered in the analysis of the proposed project's impacts related to air quality are identified in the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. A list of plans, policies, and regulations considered in the analysis is provided below.

- Clean Air Act and National Ambient Air Quality Standards
- Conformity Rule
- Non-Diesel Rule
- Vehicle Fuel Emission Standards
- NASA Ames Development Plan
- California Clean Air Act and California Ambient Air Quality Standards
- State Tailpipe Emission Standards
- Air District Regulations, CEQA Air Quality Guidelines, and Clean Air Foundation Program
- Metropolitan Transportation Commission and Association of Bay Area Governments Sustainable Communities Strategy

3.3.4 CEQA Findings

This section describes the environmental impacts of the proposed project on air quality in accordance with CEQA. It describes the thresholds used to determine whether an impact would be significant and methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts on air quality in accordance with NEPA is provided separately in Section 4.5.3, *Air Quality*, in Chapter 4, *Environmental Impact Statement*.

3.3.5 Thresholds of Significance

In accordance with Appendix G of the CEQA Guidelines, the proposed project would have the potential to have a significant effect on air quality if it would result in any of the following conditions.

Would the project:

- Conflict with or obstruct implementation of the applicable air quality plan?
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?
- Expose sensitive receptors to substantial pollutant concentrations?
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to regional or local air quality (including receptor exposure to pollution and odors)?

Each of these conditions is evaluated based on guidance outlined in the Air District's *CEQA Air Quality Guidelines*.[17] Thresholds specific to each of the impact conditions are further defined in the following subsections.

3.3.5.1 Conflict with Applicable Air Quality Plans

The current air quality attainment plan for the SFBAAB is the 2017 Clean Air Plan. According to the Air District's *CEQA Air Quality Guidelines*, a determination of consistency with the 2017 Clean Air Plan should demonstrate that a project achieves the following.[18]

- Supports the primary goals of the air quality plan
- Includes applicable control measures from the air quality plan
- Does not disrupt or hinder implementation of any air quality plan control measures

According to Air District guidance, a project would not conform to the applicable air quality plan (i.e., 2017 Clean Air Plan) and would therefore result in a significant impact under CEQA by not supporting the primary goals of the 2017 Clean Air Plan, including applicable control measures, or disrupting or hindering implementation of control measures from the 2017 Clean Air Plan.

[17] Bay Area Air District. 2023. *California Environmental Quality Act Air Quality Guidelines*. April.

[18] Ibid.

3.3.5.2 Result in a Cumulatively Considerable Net Increase in Criteria Pollutants

The Air District has developed recommended thresholds to evaluate whether a project's emissions would result in a cumulatively considerable adverse contribution to existing air quality conditions by not attaining the federal ozone or $PM_{2.5}$ standards. The SFBAAB is in nonattainment for ozone and $PM_{2.5}$, reflecting an existing significant cumulative impact. Because impacts from criteria pollutants are cumulative in nature, the project-level and cumulative impact threshold are the same. If a project's net emissions are below the thresholds, the proposed project would not be expected to result in a significant impact or a cumulatively considerable contribution to a significant cumulative impact. However, if any of the thresholds summarized in Table 3.3-7 are exceeded, net emissions generated by the proposed project could result in a significant impact and make a cumulatively considerable contribution to significant cumulative impacts under CEQA. A net increase in emissions under CEQA is defined as predicted project emissions minus predicted emissions under existing conditions (CEQA No-Project/Existing Conditions Alternative).

Table 3.3-7. Air District Project-Level Regional Criteria Pollutant Thresholds

Pollutant	Construction	Operation
ROG	54 lb/day	54 lb/day or 10 tons/year
NO_X	54 lb/day	54 lb/day or 10 tons/year
PM_{10}	82 lb/day (exhaust) Best management practices (dust)	82 lb/day or 15 tons/year (total)
$PM_{2.5}$	54 lb/day (exhaust) Best management practices (dust)	54 lb/day or 10 tons/year (total)

Source: Bay Area Air District. 2023. *California Environmental Quality Act Air Quality Guidelines*. April.
lb = pound; NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

The Air District's thresholds are based on the federal New Source Review program offset requirements. The Air District has determined that use of these offset requirements as thresholds of significance for criteria pollutants is an appropriate and effective means of promoting consistency in significance determinations in the environmental review process. Thus, the Air District's thresholds were set as the total emissions thresholds associated within the New Source Review program to help attain the national ambient air quality standards (NAAQS) and California ambient air quality standards (CAAQS).[19] Projects that exceed these thresholds could degrade regional air quality in the SFBAAB and contribute to unhealthy air quality conditions. Additional context on potential health outcomes of regional criteria pollutants generated by the proposed project is presented in Section 3.3.7, *Impacts and Mitigation Measures*.

[19] Ibid.

3.3.5.3 Expose Sensitive Receptors to Substantial Pollutant Concentrations

Carbon Monoxide

Heavy traffic congestion can contribute to high levels of CO. Individuals exposed to such "hot spots" may have a greater likelihood of developing adverse health effects. The Air District has adopted screening criteria that provide a conservative indication of whether project-generated traffic would cause a potential CO hot spot. A project would not cause localized violations of the CAAQS for CO if the Air District's CO screening criteria, summarized below, are met.[20]

- The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour.
- The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., a tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).
- The project would be consistent with an applicable congestion management program (CMP) established by the county congestion management agency for designated roads or highways, the regional transportation plan, and local congestion management agency plans.

If the screening criteria are not met, a quantitative analysis, through site-specific dispersion modeling of project-related CO concentrations would be necessary. CO concentrations would result in a significant impact under CEQA if they exceed the CAAQS or NAAQS.

The Air District does not consider construction-generated CO to be a significant pollutant of concern because construction activities typically do not generate substantial quantities of this particular pollutant.[21]

Particulate Matter

The Air District adopted an incremental $PM_{2.5}$ concentration-based significance threshold in which a "substantial" contribution at the project level for an individual source is defined as total (i.e., exhaust and fugitive) $PM_{2.5}$ concentrations exceeding 0.3 $\mu g/m^3$. Exceedance of this threshold would result in a significant impact under CEQA.

Toxic Air Contaminants

Long-term exposure to certain TACs can lead to cancer, birth defects, and damage to the brain and nervous systems. The Air District has adopted incremental cancer and hazard thresholds to evaluate receptor exposure to single sources of TAC emissions. The "substantial" TAC threshold defined by the Air District is exposure of a sensitive receptor to an individual emissions source, resulting in a project-level excess cancer risk level of more than 10 in 1 million or a non-cancer (i.e., chronic or acute) hazard index greater than 1.0.[22] Exceedances of these thresholds would result in a significant impact under CEQA.

[20] Ibid.

[21] Ibid.

[22] Ibid.

In addition to these numeric thresholds, the Air District considers the storage or use of acutely hazardous materials near receptors to be significant. The Air District also considers a project to have a significant asbestos impact if it does not comply with the applicable regulatory requirements outlined in Air District Regulation 11, Rule 2.[23]

3.3.5.4 Result in Odor Emissions

The Air District and CARB have identified several types of land uses as being commonly associated with odors, such as landfills, wastewater treatment facilities, and animal processing centers.[24,25] The Air District's *CEQA Air Quality Guidelines* further defines a significant odor impact as five confirmed odor complaints per year averaged over 3 years.[26] Exceedances of these thresholds would result in a significant impact under CEQA.

3.3.5.5 Result in Cumulatively Considerable Contribution to a Significant Regional or Local Air Quality Impact

The Air District has developed project-level thresholds that are derived from region-specific modeling that demonstrates the air basin can cumulatively accommodate project emissions below the threshold levels without affecting the attainment of the health-protective NAAQS or CAAQS, as required by the local air quality plans.[27] Thus, exceedance of any project-level threshold identified in Section 3.3.7, under Impact CEQA-AIR-1, *Conflict with Applicable Air Quality Plans*, through Impact CEQA-AIR-4, *Result in Odor Emissions*, would constitute a cumulatively considerable and significant impact under CEQA. In addition, the Air District considers projects to have a cumulatively considerable adverse impact on health from localized $PM_{2.5}$ if sensitive receptors are exposed to $PM_{2.5}$ concentrations from local sources within 1,000 feet, including existing sources, project-related sources, and reasonably foreseeable future sources, that exceed 0.8 $\mu g/m^3$.[28] The Air District also considers projects to have a cumulatively considerable DPM impact if they contribute to DPM emissions that, when combined with cumulative sources within 1,000 feet of sensitive receptors, result in excess cancer risk levels of more than 100 in 1 million or a hazard index greater than 10.0.[29]

3.3.6 Methods for Analysis

This section summarizes the methods used to analyze potential air quality impacts. The quantification methodology is applicable to the analysis of impacts under CEQA and effects under NEPA. The *Berkeley Space Center at NASA Research Park Air Quality, Health Risk Assessment, and Greenhouse Gas Technical Report* (Air Quality, Health Risk, and GHG Technical Report) prepared by ICF, April 2026 (Appendix 3.3-1 of this joint EIR/EIS) provides additional detail on the analysis, including specific modeling assumptions and outputs.

3.3.6.1 Mass Emissions Modeling[30]

Construction

The buildout of the proposed project would occur over four phases, spanning approximately 14 years. Based on current information, it is anticipated construction would begin, at the earliest, in 2027. However, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions because of improvements in engine technology and regulations to reduce combustion emissions. Accordingly, the construction analysis reflects a conservative representation of emissions.

Construction activities have the potential to create air quality impacts through the use of heavy-duty construction equipment, along with construction workers' vehicle trips, on-road truck trips, paving operations, and the application of architectural coatings. In addition, fugitive dust emissions would result from removal of the existing structures and earthmoving activities. Criteria pollutant and ozone precursor emissions from construction activities were estimated using the California Emissions Estimator Model (CalEEMod), version 2022, and project-specific construction data (e.g., schedule, equipment, on-site and off-site truck volumes) provided by the project engineering team. The CEQA Proposed Project and the CEQA Reduced Density Alternative would result in the same types of land uses in the same locations and with the same maximum building heights; however, the internal floor-to-floor heights of the research buildings would be different. Accordingly, there is no measurable difference in the model parameters for the CEQA Proposed Project and the CEQA Reduced Density Alternative, except for architectural coatings. Construction of the Water Reuse Facility (WRF) Option or Central Utility Plant (CUP) Option would require additional off-road equipment and on-road vehicles, beyond that required for construction of the CEQA Proposed Project.

Emissions modeling for each construction year is presented in Section 3.3.7, *Impacts and Mitigation Measures*, under the subheading *Construction* in Impact CEQA-AIR-2.

30 As discussed in the Air Quality, Health Risk, and GHG Technical Report, the air quality analysis uses mobile source emission rates from EMFAC2021 with CARB's off-model adjustments. While CARB has released EMAFC2025 version 2.1.0, the tool was not available at the time the Notice of Preparation was issued for the environmental document. EMFAC2025 also has not yet been approved by EPA. The off-model adjustment factors for EMFAC2021 address Congressional Resolutions that disapproved EPA's decisions to grant California waivers for several regulations, including Advanced Clean Trucks (ACT), Zero-Emission Airport Shuttle, Heavy-Duty Vehicle and Engine Emission Warranty and Maintenance Provisions (Warranty Phase 1), and Heavy-Duty Omnibus (Omnibus). While the action is currently being litigated, no injunction has been issued to block the revocation, and California can no longer enforce the regulations. Emissions of NOx, ROG, PM_{10}, and $PM_{2.5}$ from construction and operational mobile sources have been adjusted based on CARB guidance to remove the estimated emissions benefits attributed to the regulations. The Air Quality, Health Risk, and GHG Technical Report provides emission results without the regulatory adjustments for informational purposes.

Full Operations

Operations would generate criteria pollutant and ozone precursor emissions from mobile, area, stationary, and fugitive sources.[31,32] Emissions from these sources were modeled using CalEEMod, guidance from the Air District[33] and project-specific operating data provided by the project engineering team and Fehr & Peers.[34] As discussed in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, the proposed project would incorporate various sustainability strategies that will minimize potential impacts on air quality. The operational air quality analysis accounts for an all-electric design (i.e., no natural gas) and vehicle miles traveled (VMT) benefits from sustainable transportation, as quantified by the project transportation consultants.[35]

Full buildout was assumed to occur in 2041, which is the first year following completion of construction. However, based on information available at the time of the technical analysis, emissions were quantified assuming project operations would begin in 2040. It is projected that the emissions intensity of some operational sources, such as vehicle operation, in 2041 would be lower than under 2040 conditions because of potential improvements in engine technology and regulations to reduce combustion emissions. Accordingly, the operations analysis reflects a conservative representation of emissions.

Emissions modeling under full buildout is presented in Section 3.3.7, *Impacts and Mitigation Measures*, under the subheading *Full Operations* in Impact CEQA-AIR-2.

Concurrent Construction and Operations

In addition to full buildout, operational modeling was conducted for years that could overlap with construction. Partial building operation could begin in 2032, following completion of the first phase of construction. Accordingly, concurrent construction and partial operational activities would occur from 2032 through 2040, resulting in higher average daily and annual emissions than those of either component when analyzed separately. For purposes of analysis, partial operational emissions were quantified for the land uses constructed during the first three phases. Emissions were quantified for the first year following completion of construction for each phase and held constant for all future

---

31 The project includes an all-electric design; it would not generate criteria pollutants directly from electricity consumption. As discussed in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, gases (e.g., oxygen, carbon dioxide, nitrogen, natural gas) may be used by tenants for research purposes in laboratories within the Research and Office Uses. Some types of gas combustion (e.g., natural gas) can generate criteria pollutant emissions. The specific types and quantities of gases needed to support future research are not known; thus, any resulting emissions cannot be accurately quantified at this time. Any emissions generated by tabletop gas combustion are expected to be minor as these devices hold limited quantities of gas (e.g., 50 milliliters) and would be used sporadically for research purposes. Given the expected limited emissions, inclusion of tabletop gas combustion in the analysis would not change any significance determinations. The project does not include construction of any new natural gas infrastructure (only relocations and replacement).

32 Both the CEQA Proposed Project and CEQA Reduced Density Alternative would remove 227 existing trees during construction and plant 1,283 new trees, resulting in the net addition of 1,056 trees. Trees can improve air quality by absorbing ozone, NO_2, and SO_2 and removing particulate matter. These air pollution benefits are conservatively excluded from the project analysis. Based on the modeling presented in Appendix 3.3-1, net average daily reductions are expected to range from 0.79 pound to less than 0.01 pound, depending on the pollutant.

33 Bay Area Air District. 2021. *Permit Handbook*. August.

34 Tan, Valerie. Senior transportation planner, Fehr & Peers. July 19, 2025—email message to ICF regarding BSC Moffett (AQ and noise coordination regarding transportation data).

35 Ibid.

years through 2040. This approach is conservative because annual operational emissions for each phase are likely to decrease each year due to declining emissions rates from improvements in vehicle technologies and emission controls. As noted above, the emissions results are also conservative because the modeling was conducted assuming construction and operations would begin one year sooner than anticipated based on current information.

Emissions modeling for each year of partial operations and overlapping construction is presented in Section 3.3.7, *Impacts and Mitigation Measures*, under the subheading *Concurrent Construction and Operations* in Impact CEQA-AIR-2.

3.3.6.2 Health Risk Assessment[36]

A health risk assessment (HRA) was conducted to assess the potential impacts associated with public exposure to TACs[37] and localized $PM_{2.5}$ exhaust and fugitive dust during construction and operation of the proposed project. The HRA was conducted using the *Guidance Manual for Preparation of Health Risk Assessments*[38] and the Air District's *CEQA Air Quality Guidelines*.[39] The American Meteorological Society/EPA Regulatory Model (AERMOD) dispersion model (Version 24142) was used to estimate pollutant concentrations at specific distances from emission sources and CARB's Hot Spots Analysis & Reporting Program (HARP2) software was used to estimate the cancer risk, chronic and acute hazard index via HARP2's Risk Assessment Standalone Tool (RAST), Version 22118.

The modeling domain included all on-site receptors (future residents and employees associated with the proposed project within the Project Site) and off-site receptors (existing and future residents and employees outside of the Project Site, but within the Local Air Quality Study Area. Figure 3.3-1 in Section 3.3.2, *Affected Environment/Environmental Setting,* shows the receptor types, including modeled sensitive receptors (residential and daycare) and the modeled worker receptors (on-site workers, off-site workers, park, undefined workers, educational) in the Local Air Quality Study Area. On-site residential receptors were evaluated for the longest duration stay for the proposed Student/Faculty Housing, which would be a total of 8 years. Off-site residential receptors were evaluated using a 30-year cancer risk exposure duration following Air District guidance.[40] Off-site and future on-site workers were evaluated using the 25-year cancer risk for worker receptors following OEHHA guidance.[41] OEHHA guidance was also used to define other factors that affect the pollutant dose that a receptor would receive, including but not limited to age-specific daily breathing rates and exposure time, frequencies, and duration.

---

36 The health risk assessment modeling accounts for mobile source emissions of DPM and $PM_{2.5}$ that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

37 As noted in Section 3.3.2, *Affected Environment/Environmental Setting*, the primary TACs of concern associated with the proposed project and included in the HRA are DPM, asbestos, trichloroethene, tetrachloroethene, 1,2-dichloroethene, vinyl chloride, and 1,1-dichloroethane.

38 Office of Environmental Health Hazard Assessment. 2015. *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.* February. Available: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf. Accessed: July 15, 2024.

39 Bay Area Air District. 2023. *California Environmental Quality Act Air Quality Guidelines*. Appendix E Recommended Methods for Screening and Modeling Local Risks and Hazards. August.

41 Office of Environmental Health Hazard Assessment. 2015. *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.* February. Available: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf. Accessed: July 15, 2024.

As discussed in Section 3.3.6.1, *Mass Emissions Modeling*, buildout of the proposed project would occur over four phases. Emissions and exposure to sensitive populations would vary across these phases and duration of the entire construction period. Therefore, the following five exposure scenarios were evaluated to capture the period of maximum impact on each sensitive population and location. The maximum impact from each of these scenarios is reported in Section 3.3.7, *Impacts and Mitigation Measures*.

- **Scenario 1.** Off-site receptors' exposure beginning at the start of Phase 1 construction.
- **Scenario 2.** Off-site and on-site Phase 1 receptors' exposure beginning at the start of Phase 2 construction.
- **Scenario 3.** Off-site and on-site Phase 1 and Phase 2 receptors' exposure beginning at the start of Phase 3 construction.
- **Scenario 4.** Off-site and on-site Phase 1, Phase 2, and Phase 3 receptors' exposure beginning at the start of Phase 4 construction.
- **Scenario 5.** Off-site and on-site Phase 1, Phase 2, Phase 3, and Phase 4 receptors' exposure to full operations.

3.3.7 Impacts and Mitigation Measures

Impact CEQA-AIR-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction AQ-2. Zero-Emission On-Road Vehicles during Construction AQ-3. Fugitive Dust Control AQ-4. Low-VOC Coatings during Construction AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations AQ-6. Electric Landscaping Equipment during Operations AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions AQ-8. Enhanced Dust Control AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction	Significant and Unavoidable with Mitigation

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
		GHG-1. Best Management Practices for Construction-Related GHG Emissions HAZ-1. Implement the Environmental Issues Management Plan TRAN-1. Mitigated TDM Plan that Further Reduces VMT	
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Significant and Unavoidable with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

[a] Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required during concurrent construction and operations.

CEQA Proposed Project (NEPA Build Alternative 1)

The CAA requires a State Implementation Plan or an air quality control plan to be prepared for areas where air quality violates the NAAQS. The most recently adopted air quality control plan for the SFBAAB is the Air District's 2017 Clean Air Plan. The 2017 Clean Air Plan does not include control measures that apply directly to individual development projects. Rather, the Air District and its partner agencies work collaboratively to implement measures across the following sectors: stationary sources, transportation, energy, buildings, agriculture, natural and working lands, waste management, water, and super-greenhouse gas (GHG) pollutants.[42]

As discussed in Section 3.3.5, *Thresholds of Significance*, the Air District's *CEQA Air Quality Guidelines* outline three criteria for determining project-level consistency with the 2017 Clean Air Plan. The criteria are assessed below.

Criteria 1—Does the project support the primary goals of the air quality plan?

The 2017 Clean Air Plan includes two primary goals:

- **Protect Air Quality and Health at the Regional and Local Scale**: Attain all State and national air quality standards and eliminate disparities among San Francisco Bay Area (Bay Area) communities in the cancer health risk from TACs.
- **Protect the Climate**: Reduce Bay Area GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050.

[42] Bay Area Air District. 2017. *2017 Clean Air Plan: Spare the Air, Cool the Climate*. April

The proposed project would redevelop a site with largely vacant buildings and densify the area through the construction of multi-story research and development (R&D), academic, and residential buildings. The Project Site is an infill site, defined by Public Resources Code Section 2109(a)(4) as a lot in an urban area that has been previously developed or a vacant site where at least 75 percent of the perimeter of the site adjoins or is separated by only an improved public right-of-way from parcels that are developed with qualified urban uses. Furthermore, the proposed project is in a Transit Priority Area, which is defined by Public Resources Code Section 21099(a)(7) as an area within 0.5 mile of an existing or planned major transit stop, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program or applicable regional plan. The nearest transit stop (Bayshore/NASA Santa Clara Valley Transportation Authority [VTA] light rail station) is within 0.5 mile, providing convenient public transit access for future employees and residents.

The proposed project would incorporate various sustainability strategies that would help protect air quality, human health, and the climate. Sustainability features of the proposed project are discussed further in Chapter 2, *Proposed Project/Proposed Action and Alternatives*. These features would be achieved through individual sustainability strategies to reduce energy consumption, water consumption, and waste generation. Key sustainability strategies are discussed under Criteria 2 in Table 3.3-8. Refer to Section 3.8, *Greenhouse Gas Emissions*, for additional discussion on how the proposed project supports the Bay Area's GHG reduction goals.

Although the project design and sustainability features are consistent with the overarching goals of the 2017 Clean Air Plan, buildout of the proposed project would result in operational ROG and PM_{10} emissions above the Air District's thresholds (refer to Impact CEQA-AIR-2). Although exceedances of the Air District's thresholds do not specifically correlate to project-level violations of CAAQS, they do indicate that the proposed project would result in a cumulatively considerable increase to regional pollution in the SFBAAB. This additional pollutant load may hinder the Air District's ability to attain the CAAQS at the air basin level. As discussed under Impact CEQA-AIR-3, the proposed project would also result in new sources of TACs and $PM_{2.5}$ that could expose receptors to additional health risks during construction and long-term operation. Given that the proposed project census tract is a state-designated low-income community (Assembly Bill [AB] 1550), these additional risks may hinder the Air District's ability to eliminate health disparities among Bay Area communities. Accordingly, the CEQA analysis conservatively finds that the CEQA Proposed Project (with or without the WRF Option or CUP Option) would not support the primary goals of the 2017 Clean Air Plan.

Criteria 2—Does the project include applicable control measures from the air quality plan?

The 2017 Clean Air Plan recognizes that community design dictates individual travel mode and that a key long-term control strategy to reduce emissions of criteria pollutants, air toxics, and GHGs from motor vehicles is to channel future Bay Area growth into vibrant urban communities where goods and services are co-located and people have a range of viable transportation options. To that end, the 2017 Clean Air Plan includes control measures that are aimed at reducing air pollution in the SFBAAB. Table 3.3-8 summarizes project consistency with applicable control measures identified in the 2017 Clean Air Plan (grouped by sector).

Table 3.3-8. Proposed Project Consistency with Applicable Control Measures of the 2017 Clean Air Plan

Sector	Consistency Analysis
Stationary Sources	Control measures in this sector target primarily individual stationary source categories (e.g., boilers), most of which are not applicable to the proposed project. New stationary sources of emissions associated with the proposed project include emergency generators, cooling towers, and, to the extent they include permitted equipment, laboratories. Stationary sources are regulated directly by the Air District. New stationary sources installed under the proposed project would comply with all applicable Air District rules and regulations; this includes securing required permits. Thus, the proposed project would not conflict with control measures within the stationary source sector.
Transportation	Control measures in this sector focus on reducing vehicle trips and VMT by promoting active transportation and high-quality transit, improving traffic congestion, and transitioning the vehicle fleet from high-emitting vehicles to zero-emissions vehicles. The proposed project includes numerous design elements (e.g., pedestrian circulation improvements, bicycle circulation improvements and bicycle parking, transportation demand management [TDM] measures) that would reduce VMT and encourage alternative forms of transportation. As noted above under Criteria 1, the site is within 0.5 mile of the Bayshore/NASA VTA light rail station and within walking and biking distance. The proposed project would meet the CALGreen Tier 2 nonresidential voluntary requirement for EV parking (i.e., as of 2025 45 percent of all spaces to be EV capable and 33 percent of the EV spaces to have EV supply equipment). Thus, the proposed project would not conflict with control measures within the transportation sector.
Energy	Control measures in this sector focus on decarbonization and promoting energy efficiency and conservation. The proposed project would install photovoltaic systems as a strategy for generating power on-site and offsetting the energy use from each proposed building. The proposed building design would respond to the climate by optimizing thermal comfort through passive cooling and windbreaks and prioritizing daylight within floor plates buildings and outdoor spaces. These design elements would increase use of renewable energy and promote energy efficiency and conservation. Thus, the proposed project would not conflict with control measures within the energy sector.
Buildings	Control measures in this sector target improved energy efficiency, an all-electric building design, and net-zero GHG buildings. In addition to the design features noted above in the Energy sector, the proposed project would achieve, at a minimum, an LEED Silver rating. The proposed project would also have an all-electric design for new building systems (e.g., HVAC, mechanical). These design elements would result in buildings that outperform the current 2022 California Building Energy Title 24 energy efficiency standards. Thus, the proposed project would not conflict with control measures within the building sector.
Agriculture	The proposed project does not include farming or agriculture. Therefore, the proposed project would not conflict with control measures within the agriculture sector.
Natural and Working Lands	Control measures in this sector focus on increasing carbon sequestration and promoting urban tree planting. Although construction would require removal of 227 trees, the proposed project would plant approximately 1,283 new trees. These trees would increase carbon sequestration and provide shade to reduce urban heat-island effects. Thus, the proposed project would not conflict with control measures within the natural and working lands sector.

Sector	Consistency Analysis
Waste Management	Control measures in this sector focus on methane capture (at waste management facilities) and waste diversion away from landfills through efforts to reduce, reuse, and recycle. The proposed project includes color-coded receptables to separate waste by stream (landfill, recycle, compost), smart waste collection bins to encourage proper disposal of waste, waste compaction equipment to reduce the volume of waste, and textile recycle and cardboard take-back programs. Through these design elements, the proposed project would divert more than 85 percent of waste from landfills. Thus, the proposed project would not conflict with control measures within the waste sector.
Water	Control measures in this sector focus on reducing emissions from water treatment facilities and increasing water conservation. The proposed project would incorporate potable water conservation features (e.g., low-flow flush-and-flow fixtures for indoor water use), a drip irrigation system, and drought-friendly and ecologically appropriate plantings. In addition, the on-site recycled water system would serve the proposed buildings and irrigated areas. Thus, the proposed project would not conflict with control measures within the water sector.
Super-GHG Pollutants	Control measures in this sector focus on reducing short-lived climate pollutants on a sector-by-sector basis (e.g., agriculture, oil refineries, refrigerants). Centrifugal chillers installed in project buildings would be charged with R-513a, and air-source heat pumps would be charged with R-545b. R-513a and R-545b are considered substances with low global war mining potential (GWP) and replacements for hydrofluorocarbons with high GWP. Thus, the proposed project would not conflict with control measures within the super-GHG pollutants sector.

CALGreen = California Green Building Standards Code; EV = electric vehicle; GWP = global warming potential; HVAC = heating, ventilation, and air-conditioning; LEED = Leadership in Energy and Environmental Design; NASA = National Aeronautics and Space Administration; TDM = transportation demand management; VMT = vehicle miles traveled; VTA = Santa Clara Valley Transportation Authority

Criteria 3—Does the project disrupt or hinder implementation of any air quality plan control measures?

The proposed project does not hinder implementation of any control measures in the 2017 Clean Air Plan (see Table 3.3-8). At the project level, the following control measures are directly applicable to the proposed project: TR2-Trip Reduction Programs, TR9-Bicycle and Pedestrian Access and Facilities, EN2-Decrease Electricity Demand, BL1-Green Buildings, BL-2 Decarbonize Buildings, NW2-Urban Tree Planting, WA3-Green Waste Diversion, WA4-Recycling and Waste Reduction, and WR2-Support Water Conservation. Other control measures are not directly applicable to the proposed project, such as those involving research and regional collaboration or those that are policies and practices for the Air District and/or its partner agencies to adopt. Although these types of measures are not applicable, the proposed project would not hinder the measures from being implemented by the Air District or other agencies.

Conclusion

Based on the discussion above, the proposed project would incorporate all applicable control measures of the 2017 Clean Air Plan and would not disrupt or hinder any control measures. The same sustainability strategies described above for the CEQA Proposed Project would be implemented with the CUP or WRF Options. The CUP Option would further support the 2017 Clean Air Plan energy sector goals by optimizing local energy generation and distribution, which in turn

improves overall system generation and energy conservation. The WRF Option would further support the 2017 Clean Air Plan water sector goals by reusing water on-site, which in turn reduces the need to transport water over long distances and conserves energy. However, because the CEQA Proposed Project (with or without the WRF Option or CUP Option) would result in criteria pollutant emissions (see Impact CEQA-AIR-2) and cancer risk and $PM_{2.5}$ concentrations above the Air District's thresholds (see Impact CEQA-AIR-3), the proposed project could impede protection of regional air quality and elimination of health disparities under state standards. Therefore, the proposed project could obstruct implementation of the 2017 Clean Air Plan under CEQA. This impact would be potentially significant before mitigation.

Mitigation Measures

The full text of the mitigation measures is provided under the primary impact trigger. For example, Mitigation Measures AQ-1 through AQ-7, HAZ-1, GHG-1, TRANS-1 are required to address emissions quantified and disclosed under Impact CEQA-AIR-2. Additional context and information regarding Mitigation Measures AQ-1 through AQ-7, HAZ-1, GHG-1, and TRANS-1 is provided in Impact CEQA-AIR-2.

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

Mitigation Measure AQ-4. Low-VOC Coatings during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Fugitive Dust Control

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations (Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required):

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Significance After Mitigation

Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1 are required mitigation measures that will reduce project-generated emissions during construction and operation and associated health risk from receptor exposure to TACs and $PM_{2.5}$. These measures are described under Impacts CEQA-AIR-2, CEQA-AIR-3, CEQA-GHG-1, CEQA-HAZ-1, and CEQA-TRAN-2. As discussed under Impact CEQA-AIR-2, while these measures would reduce emissions, operational ROG and PM_{10} would still exceed the Air District's thresholds. Cancer and $PM_{2.5}$ risks would likewise exceed the Air District's thresholds (see Impact CEQA-AIR-3). The analysis therefore finds that the CEQA Proposed Project (with or without the WRF Option or CUP Option) could impede protection of regional air quality and elimination of health disparities under state standards, and it could obstruct implementation of the 2017 Clean Air Plan under CEQA, even with Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1. There is no feasible mitigation beyond these measures and the project design features to eliminate the conflict. The impact is significant and unavoidable.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project.

Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Proposed Project with the No Student/Faculty Housing Variant/Sub-Alternative (Variant). The same sustainability strategies described for the CEQA Proposed Project would be implemented under the Variant. Like the CEQA Proposed Project, the Variant would result in ROG and PM_{10} emissions (see Impact CEQA-AIR-2) and cancer risk and $PM_{2.5}$ concentrations above the Air District's thresholds (see Impact CEQA-AIR-3). The analysis therefore finds that the Variant could impede protection of regional air quality and elimination of health

disparities under state standards, and it would obstruct the implementation of the 2017 Clean Air Plan under CEQA. This impact would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

Mitigation Measure AQ-4. Low-VOC Coatings during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Fugitive Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations (Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required):

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Significance After Mitigation

Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1 are required mitigation measures that will reduce project-generated emissions during construction and operation and associated health risk from receptor exposure to TACs and $PM_{2.5}$. These measures are described under Impacts CEQA-AIR-2, CEQA-AIR-3, CEQA-GHG-1, CEQA-HAZ-1, and CEQA-TRAN-2. As discussed under Impact CEQA-AIR-2, while these measures would reduce emissions, operational ROG and PM_{10} would still exceed the Air District's thresholds. Cancer and $PM_{2.5}$ risks would likewise exceed the Air District's thresholds (see Impact CEQA-AIR-3). The analysis therefore finds that the Variant could impede protection of regional air quality and elimination of health disparities under state standards, and it could obstruct the implementation of the 2017 Clean Air Plan, even with Mitigation Measures AQ-1 through AQ-9, GHG-1, HAZ-1, and TRAN-1. There is no feasible mitigation beyond these measures and the project design features to eliminate the conflict. The impact is significant and unavoidable.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Reduced Density Alternative. The same sustainability strategies described for the CEQA Proposed Project would be implemented under the CEQA Reduced Density Alternative. Like the CEQA Proposed Project, the CEQA Reduced Density Alternative would result in ROG and PM_{10} emissions (see Impact CEQA-AIR-2) and cancer risk and $PM_{2.5}$ concentrations above the Air District's thresholds (see Impact CEQA-AIR-3). In addition, as discussed under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, the CEQA Reduced Density Alternative will result in a cumulatively considerable contribution to global climate change from mobile sources. The analysis therefore finds that the CEQA Reduced Density Alternative could impede protection of regional air quality and climate and elimination of health disparities under state standards, and it would obstruct the implementation of the 2017 Clean Air Plan. This impact would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

Mitigation Measure AQ-4. Low-VOC Coatings during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Fugitive Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations (Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required):

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Significance After Mitigation

Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1 are required mitigation measures that will reduce project-generated emissions during construction and operation and associated health risk from receptor exposure to TACs and $PM_{2.5}$. These measures are described under Impacts CEQA-AIR-2, CEQA-AIR-3, CEQA-GHG-1, CEQA-HAZ-1, and CEQA-TRAN-2. As discussed under Impact CEQA-AIR-2, while these measures would reduce emissions, operational ROG and PM_{10} would still exceed the Air District's thresholds. Cancer and $PM_{2.5}$ risks would likewise exceed the Air District's thresholds (see Impact CEQA-AIR-3), and the CEQA Reduced Density Alternative would not meet regional VMT goals for the purposes of GHG reduction (see Impact CEQA-GHG-1). The analysis therefore finds that the CEQA Reduced Density Alternative could impede protection of regional air quality and climate and elimination of health disparities under state standards, and it could obstruct the implementation of the 2017 Clean Air Plan under CEQA, even

with Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1. There is no feasible mitigation beyond these measures and the project design features to eliminate the conflict. The impact is significant and unavoidable.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative.

Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Reduced Density Alternative compared to the CEQA Reduced Density Alternative with the Variant. The same sustainability strategies described above for the CEQA Proposed Project and the CEQA Reduced Density Alternative would be implemented under the CEQA Reduced Density Alternative with the Variant. Like the CEQA Proposed Project and CEQA Reduced Density Alternative, the Variant would result in ROG and PM_{10} emissions (see Impact CEQA-AIR-2) and cancer risk and $PM_{2.5}$ concentrations above the Air District's thresholds (see Impact CEQA-AIR-3). In addition, as discussed under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, the Variant will result in a cumulatively considerable contribution to global climate change from mobile sources. The analysis therefore finds that the Variant could impede protection of regional air quality and climate and elimination of health disparities under state standards, and it would obstruct the implementation of the 2017 Clean Air Plan under CEQA. This impact would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

Mitigation Measure AQ-4. Low-VOC Coatings during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Fugitive Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations (Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required):

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Significance After Mitigation

Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1 are required mitigation measures that will reduce project-generated emissions during construction and operation and associated health risk from receptor exposure to TACs and $PM_{2.5}$. These measures are described under Impacts CEQA-AIR-2, CEQA-AIR-3, CEQA-GHG-1, CEQA-HAZ-1, and CEQA-TRAN-2. As discussed under Impact CEQA-AIR-2, while these measures would reduce emissions, operational ROG and PM_{10} would still exceed the Air District's thresholds. Cancer and $PM_{2.5}$ risks would likewise exceed the Air District's thresholds (see Impact CEQA-AIR-3), and the Variant would not meet regional VMT goals for the purposes of GHG reduction (see Impact CEQA-GHG-1). The analysis therefore finds that the Variant could impede protection of regional air quality and climate and elimination of health disparities under state standards, and it could obstruct the implementation of the 2017 Clean Air Plan under CEQA, even with Mitigation Measures AQ-1 through AQ-9, HAZ-1, GHG-1, and TRAN-1. There is no feasible mitigation beyond these measures and the project design features to eliminate the conflict. The impact is significant and unavoidable.

Impact CEQA-AIR-2: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant (construction) Potentially Significant (full operations) Potentially Significant (concurrent construction and operations)	<u>Construction</u> AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction AQ-2. Zero-Emission On-Road Vehicles during Construction AQ-3: Fugitive Dust Control AQ-4. Low-VOC Coatings during Construction GHG-1. Best Management Practices for Construction-Related GHG Emissions HAZ-1. Implement the Environmental Issues Management Plan <u>Operations</u> AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations AQ-6. Electric Landscaping Equipment during Operations TRAN-1. Mitigated TDM Plan that Further Reduces VMT <u>Concurrent Construction and Operations[a]</u> AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions	Less than Significant with Mitigation (construction) Significant and Unavoidable with Mitigation (full operations) Less than Significant with Mitigation (concurrent construction and operations)
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant (construction) Potentially Significant (full operations)	Same as CEQA Proposed Project	Less than Significant with Mitigation (construction) Significant and Unavoidable with Mitigation

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
	Potentially Significant (concurrent construction and operations)		(full operations) Less than Significant with Mitigation (concurrent construction and operations)
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

[a] Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required during concurrent construction and operations.

Santa Clara County does not currently attain the NAAQS or CAAQS for ozone and $PM_{2.5}$ or the CAAQS for PM_{10}. The impact analysis focuses on these pollutants and their precursors. It evaluates regional air quality impacts using the Air District's thresholds in Table 3.3-7.

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

Construction of the CEQA Proposed Project (with or without the WRF Option or CUP Option) has the potential to create short-term air quality impacts through the use of heavy-duty construction equipment, construction workers' vehicle trips, on-road truck trips, paving operations, and the application of architectural coatings. In addition, fugitive dust emissions would result from removal of the existing structures and earthmoving activities. Emissions may vary substantially over the construction duration, depending on the level of activity, length of the individual construction activity, the types of equipment, number of personnel, and soil moisture content.

Construction-related emissions for the CEQA Proposed Project (with and without the WRF Option or CUP Option) have been calculated using the methods described in Section 3.3.6.1, *Mass Emissions Modeling*, and the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. Table 3.3-9 summarizes the results of the modeling for the CEQA Proposed Project. Emissions are presented for each year of construction to capture the sum of emissions from the multiple activity categories occurring within the same year. Emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-9. Estimated Average Daily Unmitigated Criteria Pollutant Emissions from Construction of the CEQA Proposed Project[a]

	Average Daily (pounds per day) [b]			
Year	**ROG**	**NO_X**	**PM_{10} (exhaust)**	**$PM_{2.5}$ (exhaust)**
2027	7	**73**	3	3
2028	10	**89**	3	3
2029	9	**84**	2	2
2030	11	**78**	2	2
2031	21	52	1	1
2032	15	**139**	4	3
2033	20	**183**	4	4
2034	30	**101**	2	2
2035	8	**85**	2	2
2036	25	**89**	2	2
2037	15	48	1	1
2038	10	**102**	2	2
2039	28	**108**	2	2
2040	19	52	1	1
Air District Threshold[c]	54	54	82	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** and underline.

[b] Presents the average emissions estimate during a single day of construction in each year.

[c] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significance without best management practices.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Construction of the WRF in 2038 and 2039 or the CUP in 2035 and 2036 would require additional off-road equipment and on-road vehicles beyond what is required for construction of the CEQA Proposed Project, resulting in additional short-term emissions during these years. Table 3.3-10 summarizes estimated unmitigated emissions for the CEQA Proposed Project in 2038 and 2039 with construction of the WRF Option. Table 3.3-11 summarizes estimated unmitigated emissions for the CEQA Proposed Project in 2035 and 2036 with construction of the CUP Option. Emissions during all other construction years would be the same as presented in Table 3.3-9 for the CEQA Proposed Project. Emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-10. Estimated Average Daily Unmitigated Criteria Pollutant Emissions from Construction of the CEQA Proposed Project with the WRF Option[a]

	Average Daily (pounds per day)[c]

2035	10	**105**	2	2
2036	26	**99**	2	2
Air District Threshold[d]	54	54	82	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The CUP would be constructed in 2035 and 2036. Emissions during all other construction years would be the same as presented in Table 3.3-9 for the CEQA Proposed Project.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] In developing the average daily thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significant without best management practices.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Table 3.3-9 indicates that construction of the CEQA Proposed Project would exceed the Air District's average daily NO_X threshold in all years except 2031, 2037, and 2040. These are transition years where construction activity from one major phase winds down and the activity for another phase begins to ramp up. Compared to the CEQA Proposed Project, the intensity of emissions would be greater with the WRF Option or CUP Option during the years of facility construction (see Tables 3.3-10 and 3.3-11). Construction of the CEQA Proposed Project with the WRF Option would exceed the Air District's average daily NO_X threshold in 2038 and 2039, and construction of the CEQA Proposed Project with the CUP Option would exceed the Air District's average daily NO_X threshold in 2035 and 2036. As reported in Table 3.3-9 for the CEQA Proposed Project, exceedances of the NO_X threshold would also occur in all other years except 2031, 2037, and 2040 under the CEQA Proposed Project with the WRF Option or the CUP Option. Fugitive dust emissions would be uncontrolled prior to mitigation, and thus conflict with the Air District's fugitive dust threshold. For the CEQA Proposed Project (with and without the WRF Option or CUP Option), there would be no exceedances of the Air District's ROG, PM_{10} (exhaust), or $PM_{2.5}$ (exhaust) thresholds.

NO_X emissions are associated primarily (about 90 to 95 percent, depending on the year) with the use of heavy-duty off-road equipment. More off-road equipment would be required during Phases 2 and 4 because more buildings would be constructed during these phases (Appendix 3.3-1). Concurrent construction of the buildings and use of additional off-road equipment, combined with other emission sources (e.g., haul trucks), would result in the exceedances shown in Tables 3.3-9 through 3.3-11. Construction NO_X emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation. Likewise, uncontrolled fugitive dust emissions are considered potentially significant under CEQA before mitigation.[43]

Full Operations

Operation of the CEQA Proposed Project (with and without the WRF Option or CUP Option) has the potential to create long-term air quality impacts through the generation of emissions from mobile, area, fugitive, and stationary sources. Emissions resulting from these sources were quantified according to the methods summarized in Section 3.3.6.1, *Mass Emissions Modeling*, and the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. Table 3.3-12 summarizes the results of the modeling for the CEQA Proposed Project. Emissions are presented under full-build conditions, which assumes all buildings developed under the proposed project are fully occupied immediately following construction. Total emissions under existing (2024) conditions are also presented; refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives*, for additional detail. The net increase in operational emissions of the CEQA Proposed Project is determined by subtracting existing (2024) operational emissions from the proposed project's estimated operational emissions at full buildout. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Except for stationary sources, operational emissions under the CEQA Proposed Project with the WRF Option or CUP Option would be the same as presented in Table 3.3-12 for the CEQA Proposed Project. One additional emergency generator would be maintained to support the WRF or CUP. The CUP would also only operate eight cooling towers instead of twelve. Tables 3.3-13 and 3.3-14 present estimated unmitigated operational emissions for the CEQA Proposed Project with the WRF

[43] Note that the Spring 2026 project-specific Environmental Issues Management Plan requires compliance with dust control measures recommended by the Air District.

Option or CUP Option, respectively. Emissions from mobile, area, and fugitive sources would be the same as estimated for the CEQA Proposed Project, and they are included in the tables to enable a total emissions summation. Total emissions under existing (2024) conditions are also presented. The net increase in operational emissions of the CEQA Proposed Project with the WRF Option or CUP Option is determined by subtracting existing (2024) operational emissions from the proposed project's estimated operational emissions at full buildout. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Tables 3.3-12 through 3.3-14 indicate that future net operational emissions under full-build conditions would exceed the Air District's daily and annual thresholds for ROG and PM_{10} with and without the WRF Option or CUP Option. Compared to the CEQA Proposed Project, the WRF Option would result in slightly higher emissions due to operation of an additional generator. The additional generator at the CUP would also result in slightly higher ROG and NO_X emissions. However, PM_{10} and $PM_{2.5}$ emissions would be slightly reduced under the CUP Option due to the operation of fewer cooling towers. The project design includes several policies that would reduce operational criteria pollutant emissions. Emissions benefits achieved by all-electric design and sustainable transportation policies have been incorporated into the emissions modeling presented in Tables 3.3-12 through 3.3-14.

Although sustainable project design features would reduce the severity of growth-oriented criteria pollutants by supporting energy-efficient buildings and fostering active and alternative transportation, the CEQA Proposed Project (with and without the WRF Option or CUP Option) would still generate ROG and PM_{10} emissions above the Air District's thresholds. ROG emissions would be primarily the result of consumer products, architectural coatings, and landscaping equipment (i.e., area sources). PM_{10} emissions would be primarily the result of private vehicle trips. Operations ROG and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Air District Threshold[e]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] Refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for emissions by source.

[d] Total project (2041) emissions minus total existing (2024) emissions.

[e] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Concurrent Construction and Operations

Occupancy of buildings constructed during Phase 1 could begin as early as 2032. Accordingly, concurrent construction and partial operational activities would occur from 2032 through 2040, resulting in higher average daily and annual emissions than either component when analyzed separately. Partial operational emissions were quantified according to the methods summarized in Section 3.3.6.1, *Mass Emissions Modeling*, and the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. Table 3.3-15 summarizes the results of the unmitigated modeling for the CEQA Proposed Project.

The WRF would be constructed in 2038 and 2039 and begin operation in 2041. Prior to 2038, concurrent construction and net partial operational activities under the CEQA Proposed Project with the WRF Option would be the same as analyzed for the CEQA Proposed Project (Table 3.3-15). Table 3.3-16 presents concurrent unmitigated construction and net partial operational emissions for the CEQA Proposed Project with the WRF Option for those years in which emissions would differ from the CEQA Proposed Project (i.e., 2038 through 2040).

The CUP would be constructed in 2035 and 2036 and would begin operation in 2038. Prior to 2035, concurrent construction and net partial operational activities under the CEQA Proposed Project with the CUP Option would be the same as analyzed for the CEQA Proposed Project (Table 3.3-15).[44] Table 3.3-17 presents concurrent unmitigated construction and net partial operational emissions for the CEQA Proposed Project with the CUP Option for those years in which emissions would differ from the CEQA Proposed Project (i.e., 2035 through 2040).

In Tables 3.3-15 through 3.3-17, emissions from existing land uses (Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives*) are subtracted from the operational results. Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA.

[44] Without the CUP Option, two cooling towers would operate during Phase 1 and five cooling towers during Phases 1 and 2. These towers would generate minor amounts of PM_{10} and $PM_{2.5}$ that would not occur prior to 2035 with the CUP Option. Although these emissions would be reduced with the CUP Option, the reduction would be negligible compared to the CEQA Proposed Project.

Air District Threshold[f]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] Unmitigated construction emissions (Table 3.3-9) plus unmitigated operational emissions from buildings constructed during Phase 1. Operational emissions were quantified under 2032 opening conditions and held constant in 2033 and 2034. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[d] Unmitigated construction emissions (Table 3.3-9) plus unmitigated operational emissions from buildings constructed during Phases 1 and 2. Operational emissions were quantified under 2035 opening conditions and held constant in 2036 and 2037. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[e] Unmitigated construction emissions (Table 3.3-9) plus unmitigated operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in 2039 and 2040. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Air District Threshold[f]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The CUP would be constructed in 2035 and 2036 and begin operation in 2038. Emissions prior to 2035 would be the same as presented in Table 3.3-15 for the CEQA Proposed Project.

[c] Total emissions consist of exhaust and fugitive dust emissions.

[d] Unmitigated construction emissions (Table 3.3-11 for 2035 and 2036; Table 3.3-9 for 2037) plus unmitigated operational emissions from buildings constructed during Phases 1 and 2. Operational emissions were quantified under 2035 opening conditions and held constant in 2036 and 2037. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[e] Unmitigated construction emissions (Table 3.3-9) plus unmitigated operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in 2039 and 2040. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Overlapping construction and net partial operational activities would result in the following additional or worsened exceedances of Air District thresholds during the construction period for the CEQA Proposed Project (with or without the WRF Option or CUP Option):

- Average daily and annual ROG: 2034 to 2040
- Average daily and annual NO_X: 2032 to 2040
- Average daily and annual PM_{10}: 2035 to 2040

The analysis indicates that combined construction and net partial operational emissions would exceed the Air District's ROG, NO_X, and PM_{10} thresholds even with project design features. Combined ROG, NO_X, and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Mitigation Measures

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

All project contractor(s) must use electric-powered lifts (including aerial, scissor, and man), welders, air compressors, and mini-excavators. Diesel- or fossil-fuel-powered lifts, welders, air compressors, and mini-excavators during construction are prohibited. The Project Proponent shall verify that the requirement to use electric versions of these equipment types is identified in construction bids and on architectural plans.

All other types of off-road equipment (i.e., non-lifts, welders, air compressors, and mini-excavators) with diesel engines greater than 25 horsepower must use EPA-certified Tier 4 Final engines. This mandate does not preclude use of engines that meet certification standards more stringent than Tier 4 Final, if commercially available at the time of construction. A copy of each unit's certified tier specification, emissions rating, and any required CARB permit or Bay Area Air District operating permit shall be made available to NASA at the time of mobilization of each piece of equipment.

All other types of off-road equipment with diesel engines less than 25 horsepower (i.e., non-Tier 4) shall be required to use renewable diesel fuel that meets the most recent ASTM D975 specification for ultra-low sulfur diesel and has a carbon intensity no greater than 50 percent of diesel with the lowest carbon intensity among petroleum fuels sold in California. Each project contractor shall provide NASA with annual reports of renewable diesel purchase records and equipment fuel consumption. Pursuant to the In-Use Off-Road Diesel-Fueled Fleets Regulation (In-Use Regulation), contractors shall also be required to submit to CARB an affirmation that the fleet complied with the renewable diesel mandate in each year that annual reporting is required under the In-Use Regulation.

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

All project contractor(s) must achieve the following minimum zero-emission on-road vehicle performance standards, as commercially and financially available and feasible at the time of construction (i.e., within 100 miles of the Project Site and equivalent powered and capable zero-emission vehicle can cost no more than 50 percent more (1.5 times) than its internal

combustion counterpart). The standards must be achieved based on the total number of vehicles onsite used to construct the proposed project over the duration of each contract. The Project Proponent shall verify that the performance standards are identified in construction bids and on architectural plans.

- 25 percent zero-emission light-duty on-road vehicles (e.g., passenger cars, light-duty trucks) associated with Phases 1 and 2 (e.g., on-site vehicles, contractor vehicles).
- 50 percent zero-emission light-duty on-road vehicles (e.g., passenger cars, light-duty trucks) associated with Phases 3 and 4 (e.g., on-site vehicles, contractor vehicles).
- 25 percent zero-emission heavy-duty on-road vehicles associated with Phases 1 and 2 (e.g., for hauling, material delivery and soil import/export).
- 50 percent zero-emission heavy-duty on-road vehicles associated with Phases 3 and 4 (e.g., for hauling, material delivery and soil import/export).

Mitigation Measure AQ-3. Fugitive Dust Control

All project contractor(s) shall be required to comply with the Air District's current basic control measures for fugitive dust. The Air District's current basic control measures are drawn from their 2023 CEQA Guidelines, Table 5-2, and are identified below. Compliance with the following control measures is required by the Spring 2026 project-specific Environmental Issues Management Plan and shall be identified in construction bids.

- All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, unpaved access roads) shall be watered two times per day.
- All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
- All visible mud or dirt trackout onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
- All vehicle speeds on unpaved roads shall be limited to 15 miles per hour.
- All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
- All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 miles per hour.
- All trucks and equipment, including their tires, shall be washed off prior to leaving the site.
- Unpaved roads providing access to sites located 100 feet or further from a paved road shall be treated with a 6- to 12-inch layer of compacted layer of wood chips, mulch, or gravel.
- Publicly visible signs shall be posted with the telephone number and name of the person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's General Air Pollution Complaints number shall also be visible to ensure compliance with applicable regulations.

Mitigation Measure AQ-4. Low-VOC Coatings during Construction

All project contractor(s) must use certified (e.g., Greenguard or Green Seal) low-volatile organic compound (VOC) paints (i.e., less than 50 grams per liter of VOC) or, when feasible, no-VOC paints (i.e., less than 5 grams per liter of VOC) during construction. The Project Proponent shall verify that the requirement to use low-VOC (and/or no-VOC) paints is identified in construction bids and on architectural plans.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

All non-residential tenants must use certified (e.g., Greenguard or Green Seal) no-VOC paints (i.e., less than 5 grams per liter of VOC) where locally (i.e., within 50 miles of the Project Site) and commercially available for the coating type. Where not locally and commercially available, use low-VOC paints (i.e., less than 50 grams per liter of VOC). NASA shall require no-VOC and low-VOC paints as a condition of occupancy for all non-residential tenants. The Project Proponent shall require all janitorial contracts mandate use of water-based or low-VOC cleaning products.

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

All landscaping equipment must use zero-emission equipment over conventional gasoline-fueled counterparts. This includes all chainsaws, chippers, lawn mowers, leaf blowers/vacuums, riding mowers, tillers, trimmers, and any other equipment used to maintain landscaping features. Gasoline- or fossil-fuel-powered landscaping equipment during operations is prohibited. The Project Proponent shall require all landscaping contracts mandate use of electric equipment.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations. Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required.

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

The Project Proponent shall offset combined construction and net partial operational ROG and PM_{10} emissions that exceed the Air District's annual thresholds to quantities below 10 tons and

15 tons per year, respectively. The preferred means of undertaking such off-site mitigation will be through a partnership with the Air District's Clean Air Foundation (Foundation), as follows:

- The Project Proponent, or its designee, shall pay a mitigation fee and an administrative fee in accordance with the provisions of the Foundation's established mitigation fee program to reduce the project impacts from combined construction and net partial operational ROG and PM_{10} emissions to a less-than-significant level (i.e., below 10 tons and 15 tons per year, respectively).
- The Project Proponent, or its designee, shall pay the mitigation and administrative fees for each of the construction years, as determined by the Foundation, in full prior to NASA approval of the tentative map, parcel map, or planned development permit for the associated construction phase.
- An alternative payment plan may be negotiated by the Project Proponent, or its designee, based on the timing of construction activities or other construction phases that are expected to exceed the Air District's threshold of significance. Any alternative payment plan must be acceptable to the Air District and agreed upon in writing prior to NASA approval of the tentative map, parcel map, or planned development permit. The alternative payment plan must cover the full quantity of required offsets, and full payment must be provided prior to the completion of construction.
- In coordination with the Air District, the Project Proponent, or its designee, may reanalyze combined construction and net partial operational ROG and PM_{10} from the proposed project prior to starting construction to update the required mitigation and administrative fees.
    - The analysis must be conducted using Air District approved emissions model(s) and the fee rates published at the time of reanalysis.
    - The analysis must use the latest available engineering data for the proposed project. Consistent with the methodology used in this joint EIR/EIS, emission factors may account for enacted regulations that will influence future year emissions intensities (e.g., fuel efficiency standards for on-road vehicles).
    - The analysis must include all required mitigation measures as specified in this joint EIR/EIS. The analysis may include additional measures to reduce construction emissions if deemed feasible and equally effective or superior by the lead agency and Project Proponent. All on-site measures assumed in the analysis must be included in the construction contracts and be enforceable by the lead agency.

Significance After Mitigation

Construction

Mitigation Measures AQ-1 and AQ-2 would be required to reduce NO_X emissions from off-road equipment and on-road vehicles, respectively. Mitigation Measure AQ-1 would require electrification of lifts, welders, air compressors, and mini-excavators. These types of equipment are commonly electrified and used during the vertical construction and architectural coatings sub-phases, which contribute substantially to unmitigated NO_X emissions. Electrified equipment does not generate criteria pollutants directly. Mitigation Measure AQ-1 further specifies that all other types of off-road equipment with diesel engines greater than 25 horsepower must use Tier 4 Final engines. Off-road equipment with engines less than 25 horsepower would be required to use

renewable diesel fuel. Mitigation Measure AQ-2 would minimize on-road exhaust emissions (including NO_X) through performance standards for use of zero-emission vehicles. Mitigation Measure AQ-3 is required to comply with the Air District's basic fugitive dust control measures. Actions undertaken pursuant to Mitigation Measure HAZ-1 to comply with the Environmental Issues Management Plan (EIMP) would likewise help minimize dust, and the measure is therefore to address air quality impacts. Although unmitigated ROG emissions are not predicted to exceed the Air District's threshold (see Tables 3.3-9 through 3.3-11), Mitigation Measure AQ-4 would also be required during construction to address overlapping construction and partial operational emissions, which are assessed under *Concurrent Construction and Operations*. Mitigation Measure GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, would achieve additional criteria pollutant reductions through requirements for idling limitations, local sourcing of materials, and other BMPs.

Tables 3.3-18 through 3.3-20 summarize estimated construction emissions for the CEQA Proposed Project, CEQA Proposed Project with the WRF Option, and CEQA Proposed Project with the CUP Option, respectively, with Mitigation Measures AQ-1 and AQ-4. Mitigation Measures AQ-3 and HAZ-1 would control fugitive dust and does not directly reduce ROG, NO_X, or particulate matter (PM) exhaust. Although Mitigation Measure AQ-2 would reduce emissions from fossil-fuel vehicles, the reductions are not specifically quantified because the measure establishes fleetwide performance standards as opposed to individual vehicle mandates. Thus, construction contractors have flexibility in meeting the standards and can select various combinations of zero-emission vehicles and fossil-fuel vehicles across their fleets, based on commercial availability and cost effectiveness. Likewise, the emissions benefits of Mitigation Measure GHG-1 are not fully quantified for the reasons discussed in Section 3.8. Tables 3.3-19 and 3.3-20 only present emissions for those years during which construction of the WRF or CUP would occur. Emissions during all other construction years would be the same as presented in Table 3.3-18 for the CEQA Proposed Project.

Table 3.3-18. Estimated Average Daily Mitigated Criteria Pollutant Emissions from Construction of the CEQA Proposed Project[a]

	Average Daily (pounds per day)[b]			
Year	**ROG**	**NO_X**	**PM_{10} (exhaust)**	**$PM_{2.5}$ (exhaust)**
2027	1	25	< 1	< 1

Air District Threshold[c]	54	54	82	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-1 and AQ-4. Mitigation Measure AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls). Mitigation Measures AQ-3 and HAZ-1 would not reduce ROG, NO_X, or PM exhaust emissions. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** and underline.

[b] Presents the average emissions estimate during a single day of construction in each year.

[c] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significance without best management practices.

$PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases; NO_X = nitrogen oxides.

Table 3.3-19. Estimated Average Daily Mitigated Criteria Pollutant Emissions from Construction of the CEQA Proposed Project with the WRF Option[a]

Select Construction Years[b]	Average Daily (pounds per day)[c]			
	ROG	NO_X	PM_{10} (exhaust)	$PM_{2.5}$ (exhaust)
2038	3	27	1	1
2039	10	17	1	< 1
Air District Threshold[d]	54	54	82	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-1 and AQ-4. Mitigation Measure AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls). Mitigation Measures AQ-3 and HAZ-1 would not reduce ROG, NO_X, or PM exhaust emissions. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The WRF would be constructed in 2038 and 2039. Emissions during all other construction years would be the same as presented in Table 3.3-18 for the CEQA Proposed Project.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] In developing the average daily thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significant without best management practices.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Select Construction Years[b]	Average Daily (pounds per day)[c]			
	ROG	NO_X	PM_{10} (exhaust)	$PM_{2.5}$ (exhaust)
2035	2	23	1	1
2036	10	16	< 1	< 1

Select Construction Years[b]	Average Daily (pounds per day)[c]			
	ROG	NO_X	PM_{10} (exhaust)	$PM_{2.5}$ (exhaust)
Air District Threshold[d]	54	54	82	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-1 and AQ-4. Mitigation Measure AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls). Mitigation Measures AQ-3 and HAZ-1 would not reduce ROG, NO_X, or PM exhaust emissions. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The CUP would be constructed in 2035 and 2036. Emissions during all other construction years would be the same as presented in Table 3.3-18 for the CEQA Proposed Project.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] In developing the average daily thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significant without best management practices.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Tables 3.3-18 through 3.3-20 indicate that construction of the CEQA Proposed Project (with or without the WRF Option or CUP Option) would not exceed the Air District's average daily NO_X threshold with Mitigation Measure AQ-1. Mitigation Measures AQ-2 and GHG-1 would achieve additional NOx reductions beyond those shown in the table. Mitigation Measures AQ-3 and HAZ-1 ensure compliance with the Air District's fugitive dust control threshold. Mitigation Measure AQ-4 would further reduce ROG emissions from architectural coatings. The Air District's thresholds were established to prevent emissions from new projects in the SFBAAB from contributing to violations of the NAAQS and CAAQS. Because mitigated construction emissions would not exceed the Air District's thresholds, the CEQA Proposed Project (with or without the WRF Option or CUP Option) would not result in cumulatively considerable increase to regional pollution in the SFBAAB. This impact is less than significant with mitigation under CEQA.

Full Operations

Mitigation Measures AQ-5 and AQ-6 are required to reduce ROG emissions from area sources. Mitigation Measure AQ-5 would require, at a minimum, low-VOC paints and cleaning supplies for non-residential uses. Mitigation Measure AQ-6 would require use of zero-emission landscaping equipment over conventional gasoline-fueled counterparts. Mitigation Measure AQ-6 would also reduce operational NO_X, PM_{10}, and $PM_{2.5}$ emissions. Mitigation Measure TRAN-1 would require enhancements to the project-specific transportation demand management (TDM) plan to further reduce trips and VMT.

Tables 3.3-21 through 3.3-23 summarize estimated emissions for the CEQA Proposed Project, CEQA Proposed Project with the WRF Option, and CEQA Proposed Project with the CUP Option, respectively, under full-build conditions with Mitigation Measures AQ-5, AQ-6, and TRAN-1. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Air District Threshold[f]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] The mitigation analysis conservatively assumes only use of low-VOC paints (i.e., less than 50 grams per liter VOC), which is required, at a minimum, by Mitigation Measure AQ-5. The measure would also require no-VOC paints (i.e., less than 5 grams per liter of VOC) where locally (i.e., within 50 miles of the Project Site) and commercially available for the coating type. Where no-VOC paints are used, emissions would be less than presented above.

[d] Refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for emissions by source.

[e] Total project (2041) emissions minus total existing (2024) emissions.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Tables 3.3-21 through 3.3-23 indicate that ROG and PM_{10} emissions would still exceed the Air District's thresholds with project design features and mitigation. The project design features and Mitigation Measures AQ-5, AQ-6, and TRAN-1 collectively represent best-available control strategies to reduce operational emissions resulting from buildout of a large-scale development project. Ongoing and forthcoming regulatory programs led by CARB and the Air District will continue to reduce ROG and PM10 emissions in the SFBAAB. These reductions are often achieved through statewide and regional rulemaking—such as CARB's Consumer Products Regulations and updates to the Air District's Regulation 8, Organic Compounds—which operate independently of any individual development project. It is likely that by the proposed project's full buildout year, emissions associated with consumer products (ROG) and mobile sources (ROG and PM10) would be lower than those reflected in this analysis because of additional state and regional regulatory programs.

There is no feasible mitigation beyond Mitigation Measures AQ-5, AQ-6, and TRAN-1 and the project design features to reduce operational ROG and PM_{10} emissions below the Air District's thresholds. As discussed under *Concurrent Construction and Operations*, Mitigation Measure AQ-7 is required to offset ROG and PM_{10} emissions generated from 2035 through 2040. Although this measure is accepted to address 6 years of near-term emissions, it is not considered feasible to mitigate the long-term operational ROG or PM_{10} impact identified in Tables 3.3-21 through 3.3-23 for the following reasons:

- The potential for significant cost escalation creates economic uncertainty that could place an undue financial burden on the proposed project. CARB publishes annual cost-effectiveness limits for emission reduction projects funded through the Carl Moyer Memorial Air Quality Standards Attainment Program (Carl Moyer Program). Although not all local air district incentive programs are administered through the Carl Moyer Program, the published cost-effectiveness limit provides a reasonable measure to estimate potential mitigation cost. Over a 30-year operational analysis period, purchasing operational offsets for ROG and PM_{10} emissions over the Air District's annual thresholds would result in approximately $26.7 million in fees for the CEQA Proposed Project. This estimate is based on the current (2024) base limit of $60,000 per ton and a 5 percent administrative fee.[45] The Carl Moyer Program cost-effectiveness limit reflects the cost of regulations and technology and has historically increased year over year. For example, the cost-effectiveness limit in 1998 was $12,000 per ton. In 2015 and 2021, the base limits were $18,262 per ton and $33,000 per ton, respectively.[46] Thus, not only the cost, but the rate of annual increase, is accelerating. Full buildout of the CEQA Proposed Project is expected no sooner than 2041. Based on the pattern of cost escalation between 1998 and 2024, it is reasonable that operational mitigation fees would likely be double or triple the $26.7 million estimate based on the 2024 cost-effectiveness base limit.
- It is unknown, and impossible to predict, if regional ROG and PM_{10} offsets will be available in the quantities required to successfully mitigate operational emissions over a 30-year period beginning in 2041. Emission reduction projects funded through CEQA mitigation must exceed reductions that would otherwise occur through law, regulation, or legally binding mandate. Federal, state, and local air quality regulations have expanded considerably over the past 30

[45] California Air Resources Board. 2024. *The Carl Moyer Program Guidelines, 2024 Revisions.* Appendix E: Cost-Effectiveness Limits, Discount Rates, and Capital Recovery Factors. Available: https://ww2.arb.ca.gov/sites/default/files/2024-11/Appendix% 20E_2024%20GL%20mssvh.pdf. Accessed: May 8, 2025

[46] Ibid.

years. Although this has improved air quality management and protections, it constrains the voluntary emission reduction market. In other words, with regulations already achieving relatively low emissions rates through mandated technologies or performance standards, there are fewer opportunities for additional reductions. More stringent compliance obligations for many state regulations, such as the Advanced Clean Truck and Innovative Clean Transit, are set to phase in over the next 10 to 20 years. Thus, the availability of voluntary criteria pollutant offsets is likely to become more limited over time. Because ROG and PM_{10} are regional pollutants, they must be mitigated within the same air basin (or neighboring air basin with equal or worse ambient air quality designation) to address project-level impacts. This geographic restriction further constrains offset availability.

Consequently, the impact on air quality from ROG and PM_{10} emissions during operation of the CEQA Proposed Project (with and without the WRF Option or CUP Option) would be significant and unavoidable.

Concurrent Construction and Operations

Mitigation Measures AQ-1 through AQ-6, GHG-1, HAZ-1, and TRAN-1 are required to reduce NO_X, ROG, and PM_{10} emissions during concurrent construction and partial operations. Tables 3.3-24 through 3.3-26 summarize estimated mitigated emissions for the CEQA Proposed Project, CEQA Proposed Project with the WRF Option, and CEQA Proposed Project with the CUP Option, respectively, during concurrent construction and net partial operations. The tables include anticipated emissions benefits from Mitigation Measures AQ-1, AQ-3 through AQ-6, and TRAN-1 (Mitigation Measure AQ-2, HAZ-1, and GHG-1 are not quantified or fully quantified for the reasons discussed above under *Construction*). Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA. Tables 3.3-25 and 3.3-26 only present those years during which emissions would differ from the CEQA Proposed Project (i.e., 2038 to 2040 for the WRF Option and 2035 to 2040 for the CUP Option). Emissions during all other construction years would be the same as presented in Table 3.3-24 for the CEQA Proposed Project.

Air District Threshold[f]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Construction emissions include Mitigation Measures AQ-1, AQ-3, and AQ-4 (Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified [off-road engine controls]). Operational emissions include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] Mitigated construction emissions (Table 3.3-18) plus mitigated operational emissions from buildings constructed during Phase 1. Operational emissions were quantified under 2032 opening conditions and held constant in 2033 and 2034. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[d] Mitigated construction emissions (Table 3.3-18) plus mitigated operational emissions from buildings constructed during Phases 1 and 2. Operational emissions were quantified under 2035 opening conditions and held constant in 2036 and 2037. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[e] Mitigated construction emissions (Table 3.3-18) plus mitigated operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in 2039 and 2040. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Construction emissions include Mitigation Measures AQ-1, AQ-3, and AQ-4 (Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified [off-road engine controls]). Operational emissions include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The WRF would be constructed in 2038 and 2039 and begin operation in 2041. Emissions during years prior to 2038 would be the same as presented in Table 3.3-24 for the CEQA Proposed Project.

[c] Total emissions consist of exhaust and fugitive dust emissions.

[d] Mitigated construction emissions (Table 3.3-19 for 2038 and 2039; Table 3.3-18 for 2040) plus net mitigated operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in 2039 and 2040. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[e] Unrounded values are below thresholds (53.7 pounds per day and 9.8 tons per year).

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Table 3.3-26. Estimated Average Daily and Annual Mitigated Criteria Pollutant Emissions from Concurrent Construction and Net Partial Operation of the CEQA Proposed Project with the CUP Option[a]

Select Construction Year[b]	Average Daily (pounds per day)				Annual (tons per year)			
	ROG	NO_X	PM_{10} (total)[c]	$PM_{2.5}$ (total)[c]	ROG	NO_X	PM_{10} (total)[c]	$PM_{2.5}$ (total)[c]
2035[d]	**62**	45	**84**	22	**11**	8	**15**	4
2036[d]	**69**	38	79	21	**13**	7	14	4
2037[d]	**65**	33	76	20	**12**	6	14	4
2038[e]	**78**	53	**110**	32	**14**	10	**20**	6
2039[e]	**86**	44	**106**	31	**16**	8	**19**	6

Air District Threshold[f]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Construction emissions include Mitigation Measures AQ-1, AQ-3, and AQ-4 (Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified [off-road engine controls]). Operational emissions include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The CUP would be constructed in 2035 and 2036 and begin operation in 2038. Emissions during years prior to 2035 would be the same as presented in Table 3.3-24 for the CEQA Proposed Project.

[c] Total emissions consist of exhaust and fugitive dust emissions.

[d] Mitigated construction emissions (Table 3.3-20 for 2035 and 2036; Table 3.3-18 for 2037) plus mitigated operational emissions from buildings constructed during Phases 1 and 2. Operational emissions were quantified under 2035 opening conditions and held constant in 2036 and 2037. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[e] Mitigated construction emissions (Table 3.3-18) plus mitigated operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in 2039 and 2040. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

The analysis indicates that combined construction and net partial operational emissions would exceed the Air District's ROG and PM_{10} thresholds even with project design features and Mitigation Measures AQ-1 through AQ-6, HAZ-1, GHG-1, and TRAN-1. Mitigation Measure AQ-7 is required to offset ROG and PM_{10} emissions in 2035 through 2040 to levels below Air District thresholds. The maximum total offset commitment may be recalculated prior to the start of construction as described under Mitigation Measure AQ-7. The mitigation obligation may therefore change as regulations change and new control technologies become available and effective. Mitigation Measure AQ-7 ensures that ROG and PM_{10} generated by combined construction and partial operation of the CEQA Proposed Project (with and without the WRF Option or CUP Option) would not exceed Air District thresholds. As such, neither ROG nor PM_{10} emissions would contribute a cumulatively considerable significant level of air pollution such that regional air quality within the SFBAAB would be degraded. But for the reasons described above, ROG and PM_{10} emissions during project operations after the 6 years of overlapping construction and operations would not be mitigated to a less-than-significant and less-than-cumulatively considerable level. This impact would be significant and unavoidable.

Potential Health Outcomes of Cumulatively Considerable Regional Criteria Pollutant Emissions

All criteria pollutants that would be generated by the proposed project are associated with some form of health risk. The California Supreme Court decision in *Sierra Club v. County of Fresno* (226 Cal.App.4th 704) (hereafter referred to as the Friant Ranch decision) clarifies that environmental documents must connect a project's regional air quality impacts to specific health effects or explain why it is not technically feasible to perform such an analysis. The Air District's CEQA Guidelines outline five criteria that should be included in project-level air quality analyses to demonstrate compliance with the Friant Ranch decision. Each of these criteria are addressed in the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS, which includes a discussion of the quantitative analysis performed, and limitations with respect to calculation of mitigation measures. The analysis presented in Appendix 3.3-1 concludes that models currently available to quantitatively evaluate health effects of regional air pollution are not appropriately applied at the project level. Accordingly, limitations of existing models preclude accurate meaningful analysis to correlate project-level criteria pollutant emissions and health effects for decision makers and the public, and such analysis is not included in this joint EIR/EIS.

Ultimately, Santa Clara County does not attain the NAAQS or CAAQS for ozone and $PM_{2.5}$ or the CAAQS for PM_{10}. Certain individuals residing in areas that do not meet the ambient air quality standards could be exposed to pollutant concentrations that cause or aggravate acute and/or chronic health conditions (e.g., asthma, lost workdays, premature mortality), regardless of the proposed project.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project.

Construction

The same construction activities proposed and evaluated under the CEQA Proposed Project would occur under the Variant. The intensity of construction for the CEQA Proposed Project with or without the Variant would therefore be the same, except for architectural coatings. Because the Variant does not include residential construction during Phase 4, the total coated area from architectural coatings, which generate ROG emissions, would be lower under the Variant.

Table 3.3-27 summarizes estimated ROG emissions from construction of Phase 4 under the Variant. Emissions are compared to the Air District's project-level thresholds to determine significance under CEQA. Emissions of all other pollutants during all other construction years would be the same as presented in Table 3.3-9 for the CEQA Proposed Project.

Table 3.3-27. Estimated Average Daily Unmitigated ROG Emissions from Construction of Phase 4 Under the CEQA Proposed Project with the Variant[a]

	Average Daily (pounds per day)[c]
Selected Construction Year[b]	**Unmitigated**
2037	15
2038	10
2039	26
2040	19
Air District Threshold[d]	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The intensity of construction for the CEQA Proposed Project with or without the Variant would be the same, except for architectural coatings during Phase 4. Emissions of all pollutants except ROG during Phase 4 (2037–2040) would be the same as presented in Table 3.3-9 for the CEQA Proposed Project.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] In developing the average daily thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significant without best management practices.

ROG = reactive organic gases

Table 3.3-27 indicates that ROG emissions generated during Phase 4 under the CEQA Proposed Project with the Variant would not exceed the Air District's threshold. ROG emissions would be comparable to those generated under the CEQA Proposed Project, albeit slightly reduced in 2039 and increased (as rounded) in 2040. Emissions of all other pollutants during all construction years

would be the same the CEQA Proposed Project (see Table 3.3-9), and as such, the following impact findings also apply to the Variant:

- No exceedances of the Air District's ROG, PM_{10} (exhaust), or $PM_{2.5}$ (exhaust) thresholds
- Violation of the Air District's fugitive dust control threshold
- Exceedances of the Air District's NO_X threshold in all years except 2031, 2037, and 2040

Construction NO_X emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation. Likewise, uncontrolled fugitive dust emissions are considered potentially significant under CEQA before mitigation.

Full Operations

The same operational sources proposed and evaluated under the CEQA Proposed Project would occur under the Variant. Table 3.3-28 presents estimated unmitigated operational emissions for the Variant under full-build conditions. Total emissions under existing (2024) conditions are also presented; refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for additional detail. The net increase in operational emissions of the Variant is determined by subtracting existing (2024) operational emissions from the proposed project's estimated operational emissions at full buildout. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-28 indicates that future net operational emissions for the Variant under full-build conditions would exceed the Air District's daily and annual thresholds for ROG and PM_{10}. This impact finding is the same as the CEQA Proposed Project, although compared to the CEQA Proposed Project, the Variant would result in slightly greater net emissions due primarily to increased VMT and trip generation. Operations ROG and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Concurrent Construction and Operations

The intensity of concurrent construction and net partial operational emissions for the CEQA Proposed Project with or without the Variant would be the same, except for ROG emissions during Phase 4. Table 3.3-29 summarizes estimated ROG emissions from concurrent construction and net partial operational emissions during Phase 4 under the Variant. Emissions of all other pollutants during all other construction years would be the same as presented in Table 3.3-15 for the CEQA Proposed Project. Emissions from existing land uses (Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives*) are subtracted from the operational results. Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-28. Estimated Average Daily and Annual Unmitigated Criteria Pollutant Emissions from Operation of the CEQA Proposed Project with the Variant[a]

Selected Construction Year[b]	Average Daily (pounds per day)[c]	Annual (tons per year)[d]
2037	**86**	**16**
2038	**102**	**19**
2039	**118**	**22**
2040	**110**	**20**
Air District Threshold[e]	54	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The intensity of construction for the CEQA Proposed Project with or without the Variant would be the same, except for architectural coatings during Phase 4. Emissions of all pollutants except ROG during Phase 4 (2037–2040) would be the same as presented in Table 3.3-15 for the CEQA Proposed Project. For Phase 4 (2037–2040), results reflect construction emissions (Table 3.3-27) plus operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in future years. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] Presents the total emissions estimate during each year of construction.

[e] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

ROG = reactive organic gases

The intensity of combined ROG emissions during Phase 4 would be comparable to those generated under the CEQA Proposed Project. The impact conclusions for all analysis years and pollutants would be the same as the CEQA Proposed Project, and combined construction and net partial operational emissions of the Variant would exceed the following Air District thresholds (see Tables 3.3-15 and 3.3-29):

- Average daily and annual ROG: 2034 to 2040
- Average daily and annual NO_X: 2032 to 2040
- Average daily and annual PM_{10}: 2035 to 2040

The analysis indicates that combined construction and net partial operational emissions would exceed the Air District's ROG, NO_X, and PM_{10} thresholds even with project design features. Combined ROG, NO_X, and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Mitigation Measures

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

Mitigation Measure AQ-4. Low-VOC Coatings during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/ EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations. Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required.

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Significance After Mitigation

Construction

Mitigation Measures AQ-1 and AQ-2 would be required to reduce NO_X emissions from off-road equipment and on-road vehicles, respectively. Mitigation Measure GHG-1 would also achieve NOx reductions through idling limitations, local sourcing of materials, and other BMPs. Mitigation Measures AQ-3 are required to comply with the Air District's basic fugitive dust control measures and the EIMP. Mitigation Measure AQ-4 would also be required during construction to address overlapping construction and partial operational emissions, which are assessed under the sub-header *Concurrent Construction and Operations*.

As discussed above, the intensity of NO_X emissions generated by construction of CEQA Proposed Project with or without the Variant would be the same. Table 3.3-18 above summarizes estimated

construction emissions for the CEQA Proposed Project with Mitigation Measures AQ-1 and AQ-4. Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls) for the reasons discussed above under *Construction* for the CEQA Proposed Project. Mitigation Measures AQ-3 and HAZ-1 do not directly reduce ROG, NO_X, or PM exhaust). The table indicates that construction of the Variant would not exceed the Air District's average daily NO_X threshold with Mitigation Measure AQ-1. Mitigation Measures AQ-2 and GHG-1 would achieve additional NOx reductions beyond those shown in the table. Mitigation Measures AQ-3 and HAZ-1 ensure compliance with the Air District's fugitive dust control threshold. Mitigation Measure AQ-4 would further reduce ROG emissions from architectural coatings. Because mitigated construction emissions would not exceed the Air District's thresholds, the Variant would not result in cumulatively considerable increase to regional pollution in the SFBAAB. This impact is less than significant with mitigation under CEQA.

Full Operations

Mitigation Measures AQ-5 and AQ-6 are required to reduce ROG emissions from area sources. Mitigation Measure AQ-6 would also reduce operational NO_X, PM_{10}, and $PM_{2.5}$ emissions. Mitigation Measure TRAN-1 would require enhancements to the project-specific TDM plan to further reduce trips and VMT, and this measure would reduce mobile source emissions. Table 3.3-30 summarizes estimated emissions for the Variant under full-build conditions with Mitigation Measures AQ-5, AQ-6, and TRAN-1. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-30 indicates that ROG and PM_{10} emissions would still exceed the Air District's thresholds with project design features and mitigation. The project design features and Mitigation Measures AQ-5, AQ-6, and TRAN-1 collectively represent best-available control strategies to reduce operational emissions resulting from buildout of a large-scale development project. For the reasons discussed above for the CEQA Proposed Project, there is no feasible mitigation beyond these measures and the project design features to reduce operational ROG and PM_{10} emissions below the Air District's thresholds. Consequently, the impact on air quality from ROG and PM_{10} emissions during operation of the Variant would be significant and unavoidable.

Concurrent Construction and Operations

Mitigation Measures AQ-1 through AQ-6, HAZ-1, GHG-1, and TRAN-1 are required to reduce NO_X, ROG, and PM_{10} emissions during concurrent construction and partial operations. As discussed above, the intensity of concurrent construction and net partial operational emissions for the CEQA Proposed Project with or without the Variant would be the same, except for ROG emissions during Phase 4. Table 3.3-31 summarizes estimated mitigated ROG emissions from concurrent construction and net partial operational emissions during Phase 4 under the Variant. Emissions of all other pollutants during all other construction years would be the same as presented in Table 3.3-24 for the CEQA Proposed Project. Table 3.3-31 includes anticipated emissions benefits from Mitigation Measures AQ-1, AQ-3 through AQ-6, and TRAN-1 (Mitigation Measures AQ-2, HAZ-1, and GHG-1 are not quantified or fully quantified for the reasons discussed above under *Construction* for the CEQA Proposed Project). Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA.

Air District Threshold[f]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] The mitigation analysis conservatively assumes only use of low-VOC paints (i.e., less than 50 grams per liter VOC), which is required, at a minimum, by Mitigation Measure AQ-5. The measure would also require no-VOC paints (i.e., less than 5 grams per liter of VOC) where locally (i.e., within 50 miles of the Project Site) and commercially available for the coating type. Where no-VOC paints are used, emissions would be less than presented above.

[d] Refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for emissions by source.

[e] Total project (2041) emissions minus total existing (2024) emissions.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

2039	**85**	**16**
2040	**82**	**15**
Air District Threshold[e]	54	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline. Emissions results include Mitigation Measures AQ-2, AQ-4 through AQ-6, and TRAN-1. Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls). Mitigation Measures AQ-3 and HAZ-1 would not reduce ROG emissions.

[b] The intensity of construction for the CEQA Proposed Project with or without the Variant would be the same, except for architectural coatings during Phase 4. Emissions of all pollutants except ROG during Phase 4 (2037–2040) would be the same as presented in Table 3.3-24 for the CEQA Proposed Project. For Phase 4 (2037–2040), results reflect construction emissions plus operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in future years. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] Presents the total emissions estimate during each year of construction.

[e] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

ROG = reactive organic gases

The analysis indicates that project design features and Mitigation Measures AQ-1 through AQ-6, HAZ-1, GHG-1, and TRAN-1 would reduce NO_X emissions to below Air District thresholds. However, as shown in Tables 3.3-24 and 3.3-31, ROG and PM_{10} emissions would remain elevated. Mitigation Measure AQ-7 is required to offset ROG and PM_{10} emissions in 2035 through 2040 to levels below Air District thresholds. Mitigation Measure AQ-7 ensures that ROG and PM_{10} generated by combined construction and partial operation of the Variant would not exceed Air District thresholds. As such, neither ROG nor PM_{10} emissions would contribute a cumulatively considerable significant level of air pollution such that regional air quality within the SFBAAB would be degraded. However, for the reasons described above, ROG and PM_{10} emissions during project operations after the 6 years of overlapping construction and operations would not be mitigated to a less-than-significant and less-than-cumulatively considerable level. This impact would be significant and unavoidable.

Potential Health Outcomes of Cumulatively Considerable Regional Criteria Pollutant Emissions

The potential health outcomes of cumulatively considerable ROG and PM_{10} emissions generated during operation of the Variant are the same as described above for the CEQA Proposed Project.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Construction

The same construction activities proposed and evaluated under the CEQA Proposed Project would occur under the CEQA Reduced Density Alternative. The intensity of construction for the CEQA Proposed Project and the CEQA Reduced Density Alternative would be the same except for a slight reduction in the duration of the "core and shell" and "architectural coating" sub-phases for research buildings under the CEQA Reduced Density Alternative. The interior coated area of research buildings under the CEQA Reduced Density Alternative would likewise be slightly reduced from the CEQA Proposed Project.

Table 3.3-32 summarizes estimated unmitigated construction emissions for the CEQA Reduced Density Alternative. Emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-32. Estimated Average Daily Unmitigated Criteria Pollutant Emissions from Construction of the CEQA Reduced Density Alternative [a]

	Average Daily (pounds per day)[b]			
Year	**ROG**	**NO_X**	**PM_{10} (exhaust)**	**$PM_{2.5}$ (exhaust)**
2027	7	**73**	3	3
2028	10	**89**	3	3
2029	9	**84**	2	2
2030	10	**72**	2	2
2031	19	44	1	1
2032	15	**139**	4	3
2033	20	**180**	4	4
2034	29	**91**	2	2
2035	8	**85**	2	2
2036	25	**86**	2	2
2037	13	38	1	1

2039	27	**106**	2	2
2040	17	42	< 1	< 1
Air District Threshold [c]	54	54	82	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Presents the average emissions estimate during a single day of construction in each year.

[c] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significant without best management practices.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Table 3.3-32 indicates that construction of the CEQA Reduced Density Alternative would exceed the Air District's average daily NO_X threshold in all years except 2031, 2037, and 2040. These findings are the same as the CEQA Proposed Project, although the intensity of emissions (i.e., average daily pounds) would be slightly reduced during some construction years under the CEQA Reduced Density Alternative. Construction NO_X emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation. Likewise, uncontrolled fugitive dust emissions are considered potentially significant under CEQA before mitigation.

Full Operations

The same operational sources proposed and evaluated under the CEQA Proposed Project would occur under the CEQA Reduced Density Alternative. Table 3.3-33 presents estimated unmitigated operational emissions for the CEQA Reduced Density Alternative under full-build conditions. Total emissions under existing (2024) conditions are also presented; refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for additional detail. The net increase in operational emissions of the CEQA Reduced Density Alternative is determined by subtracting existing (2024) operational emissions from the proposed project's estimated operational emissions at full buildout. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-33 indicates that future net operational emissions for the CEQA Reduced Density Alternative under full-build conditions would exceed the Air District's daily and annual thresholds for ROG and PM_{10}. This finding is the same as the CEQA Proposed Project, although compared to the CEQA Proposed Project, the CEQA Reduced Density Alternative would result in slightly lower net emissions due to reduced VMT and trip generation (mobile sources), consumer products (area sources), and lab space (fugitive sources). Operations ROG and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Concurrent Construction and Operations

Table 3.3-34 presents concurrent unmitigated construction and net partial operational emissions for the CEQA Reduced Density Alternative. Emissions from existing land uses (Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives*) are subtracted from the operational results. Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA.

Air District Threshold [g]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] Unmitigated construction emissions (Table 3.3-32) plus unmitigated operational emissions from buildings constructed during Phase 1. Operational emissions were quantified under 2032 opening conditions and held constant in 2033 and 2034. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[d] Unmitigated construction emissions (Table 3.3-32) plus unmitigated operational emissions from buildings constructed during Phases 1 and 2. Operational emissions were quantified under 2035 opening conditions and held constant in 2036 and 2037. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[e] Unmitigated construction emissions (Table 3.3-32) plus unmitigated operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in 2039 and 2040. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[f.] Unrounded values are below thresholds (53.9 pounds per day and 9.8 tons per year).

[g] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Table 3.3-34 indicates that combined construction and net partial operational emissions under the CEQA Reduced Density Alternative would exceed the following Air District thresholds even with project design features:

- Average daily and annual ROG: 2035 to 2040
- Average daily and annual NO_X: 2032 to 2036 and 2038 through 2040
- Average daily and annual PM_{10}: 2038 and 2039

These impact findings are the same as the CEQA Proposed Project, although the intensity of emissions (i.e., average daily pounds and annual tons) would be reduced during some construction years under the CEQA Reduced Density Alternative. Combined ROG, NO_X, and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Mitigation Measures

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

Mitigation Measure AQ-4. Low-VOC Coatings during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations. Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required.

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Significance After Mitigation

Construction

Mitigation Measures AQ-1 and AQ-2 would be required to reduce NO_X emissions from off-road equipment and on-road vehicles, respectively. Mitigation Measure GHG-1 would also achieve NOx reductions through idling limitations, local sourcing of materials, and other BMPs. Mitigation Measures AQ-3 and HAZ-1 are required to comply with the Air District's basic fugitive dust control measures and the EIMP. Mitigation Measure AQ-4 would also be required during construction to address overlapping construction and partial operational emissions, which are assessed under *Concurrent Construction and Operations*.

Table 3.3-35 summarizes estimated construction emissions for the CEQA Reduced Density Alternative, with Mitigation Measures AQ-1 and AQ-4. Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls) for the reasons discussed above under *Construction* for the CEQA Proposed Project. Mitigation Measures AQ-3 and HAZ-1 do not directly reduce ROG, NO_X, or PM exhaust.

Table 3.3-35. Estimated Average Daily Mitigated Criteria Pollutant Emissions from Construction of the CEQA Reduced Density Alternative [a]

	Average Daily (pounds per day)[b]			
Year	**ROG**	**NO_X**	**PM_{10} (exhaust)**	**$PM_{2.5}$ (exhaust)**

2039	10	17	< 1	< 1
2040	7	4	< 1	< 1
Air District Threshold [c]	54	54	82	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of

emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-1 and AQ-4. Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls). Mitigation Measures AQ-3 and HAZ-1 would not reduce ROG, NO_X, or PM exhaust emissions. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Presents the average emissions estimate during a single day of construction in each year.

[c] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significant without best management practices.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Like the CEQA Proposed Project, Table 3.3-35 indicates that construction of the CEQA Reduced Density Alternative would not exceed the Air District's average daily NO_X threshold with Mitigation Measure AQ-1. Mitigation Measures AQ-2 and GHG-1 would achieve additional NOx reductions beyond those shown in the table. Mitigation Measures AQ-3 and HAZ-1 ensure compliance with the Air District's fugitive dust control threshold. Mitigation Measure AQ-4 would further reduce ROG emissions from architectural coatings. Because mitigated construction emissions would not exceed the Air District's thresholds, the CEQA Reduced Density Alternative would not result in cumulatively considerable increase to regional pollution in the SFBAAB. This impact is less than significant with mitigation.

Full Operations

Mitigation Measures AQ-5 and AQ-6 are required to reduce ROG emissions from area sources. Mitigation Measure AQ-6 would also reduce operational NO_X, PM_{10}, and $PM_{2.5}$ emissions. Mitigation Measure TRAN-1 would require enhancements to the project-specific TDM plan to further reduce trips and VMT, and this measure would reduce mobile source emissions. Table 3.3-36 summarizes estimated emissions for the CEQA Reduced Density Alternative under full-build conditions with Mitigation Measures AQ-5, AQ-6, and TRAN-1. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-36 indicates that ROG and PM_{10} emissions would still exceed the Air District's thresholds with project design features and mitigation. The project design features and Mitigation Measures AQ-5, AQ-6, and TRAN-1 collectively represent best-available control strategies to reduce operational emissions resulting from buildout of a large-scale development project. For the reasons discussed above for the CEQA Proposed Project, there is no feasible mitigation beyond these measures and the project design features to reduce operational ROG and PM_{10} emissions below the Air District's thresholds. Consequently, the impact on air quality from ROG and PM_{10} emissions during operation of the CEQA Reduced Density Alternative would be significant and unavoidable.

Concurrent Construction and Operations

Mitigation Measures AQ-1 through AQ-6, HAZ-1, GHG-1, and TRAN-1 are required to reduce NO_X, ROG, and PM_{10} emissions during concurrent construction and partial operations. Table 3.3-37 summarizes estimated mitigated emissions for the CEQA Reduced Density Alternative during concurrent construction and net partial operations. The table includes anticipated emissions benefits from Mitigation Measures AQ-1, AQ-3 through AQ-6, and TRAN-1 (Mitigation Measures AQ-2, HAZ-1, and GHG-1 are not quantified or fully quantified for the reasons discussed above under *Construction* for the CEQA Proposed Project). Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA.

Net Change[e]	**59.9**	24.0	**88.2**	32.9	**10.9**	4.4	**16.1**	6.0
Air District Threshold[f]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] The mitigation analysis conservatively assumes only use of low-VOC paints (i.e., less than 50 grams per liter VOC), which is required, at a minimum, by Mitigation Measure AQ-5. The measure would also require no-VOC paints (i.e., less than 5 grams per liter of VOC) where locally (i.e., within 50 miles of the Project Site) and commercially available for the coating type. Where no-VOC paints are used, emissions would be less than presented above.

[d] Refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for emissions by source.

[e] Total project (2041) emissions minus total existing (2024) emissions.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Air District Threshold [g]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Construction emissions include Mitigation Measures AQ-1, AQ-3, and AQ-4 (Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified [off-road engine controls]). Operational emissions include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] Mitigated construction emissions (Table 3.3-35) plus mitigated operational emissions from buildings constructed during Phase 1. Operational emissions were quantified under 2032 opening conditions and held constant in 2033 and 2034. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[d] Unmitigated construction emissions (Table 3.3-35 plus unmitigated operational emissions from buildings constructed during Phases 1 and 2. Operational emissions were quantified under 2035 opening conditions and held constant in 2036 and 2037. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[e] Unmitigated construction emissions (Table 3.3-35) plus unmitigated operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in 2039 and 2040. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[f] Unrounded values are below threshold (81.9 pounds per day and 14.9 tons per year for PM_{10} in 2039 and 9.5 tons per year of ROG in 2040).

[g] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

The analysis indicates that combined construction and net partial operational emissions would exceed the Air District's ROG and PM_{10} thresholds even with project design features and Mitigation Measures AQ-1 through AQ-6, HAZ-1, GHG-1, and TRAN-1. Mitigation Measure AQ-7 is required to offset ROG emissions in 2039 and PM_{10} emissions in 2038 to levels below Air District thresholds. Mitigation Measure AQ-7 ensures that ROG and PM_{10} generated by combined construction and partial operation of the CEQA Reduced Density Alternative would not exceed Air District thresholds. As such, neither ROG nor PM_{10} emissions would contribute a cumulatively considerable significant level of air pollution such that regional air quality within the SFBAAB would be degraded. However, for the reasons described above, ROG and PM_{10} emissions during project operations after the 6 years of overlapping construction and operations would not be mitigated to a less-than-significant and less-than-cumulatively considerable level. This impact would be significant and unavoidable.

Potential Health Outcomes of Cumulatively Considerable Regional Criteria Pollutant Emissions

The potential health outcomes of cumulatively considerable ROG and PM_{10} emissions generated during operation of the CEQA Reduced Density Alternative are the same as described above for the CEQA Proposed Project.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative.

Construction

The same construction activities proposed and evaluated under the CEQA Reduced Density Alternative would occur with the Variant. The intensity of construction for the CEQA Reduced Density Alternative with or without the Variant would therefore be the same, except for architectural coatings. Because the Variant does not include residential construction during Phase 4, the total coated area from architectural coatings, which generate ROG emissions, would be lower with the Variant.

Table 3.3-38 summarizes estimated ROG emissions from construction of Phase 4 with the Variant. Emissions are compared to the Air District's project-level thresholds to determine significance under CEQA. Emissions of all other pollutants during all other construction years would be the same as presented in Table 3.3-32 for the CEQA Reduced Density Alternative.

Table 3.3-38. Estimated Average Daily Unmitigated ROG Emissions from Construction of Phase 4 under the CEQA Reduced Density Alternative with the Variant [a]

	Average Daily (pounds per day)[c]
Selected Construction Year [b]	Unmitigated
2037	13
2038	10
2039	26
2040	17
Air District Threshold [d]	54

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. Mobile source emissions of ROG have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The intensity of construction for the CEQA Proposed Project with or without the Variant would be the same, except for architectural coatings during Phase 4. Emissions of all pollutants except ROG during Phase 4 (2037–2040) would be the same as presented in Table 3.3-32 for the CEQA Reduced Density Alternative.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] In developing the average daily thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA. The Air District also considers fugitive dust emissions significant without best management practices.

ROG = reactive organic gases

Table 3.3-38 indicates that ROG emissions generated during Phase 4 under the CEQA Reduced Density Alternative with the Variant would not exceed the Air District's threshold. ROG emissions would be comparable to those generated under the CEQA Proposed Project, albeit slightly reduced in 2039 and increased (as rounded) in 2040. Emissions of all other pollutants during all construction years would be the same the CEQA Reduced Density Alternative (see Table 3.3-32), and as such, the following impact findings also apply to the Variant:

- No exceedances of the Air District's ROG, PM_{10} (exhaust), or $PM_{2.5}$ (exhaust) thresholds
- Violation of the Air District's fugitive dust control threshold
- Exceedance of the Air District's NO_X threshold in all years except 2031, 2037, and 2040

Construction NO_X emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation. Likewise, uncontrolled fugitive dust emissions are considered potentially significant under CEQA before mitigation.

Full Operations

The same operational sources proposed and evaluated under the CEQA Reduced Density Alternative would occur under the Variant. Table 3.3-39 presents estimated unmitigated operational emissions for the Variant under full-build conditions. Total emissions under existing (2024) conditions are also presented; refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for additional detail. The net increase in

operational emissions of the Variant is determined by subtracting existing (2024) operational emissions from the proposed project's estimated operational emissions at full buildout. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-39 indicates that future net operational emissions for the Variant under full-build conditions would exceed the Air District's daily and annual thresholds for ROG and PM_{10}. This finding is the same as the CEQA Reduced Density Alternative, although compared to the CEQA Reduced Density Alternative, the Variant would result in greater net emissions due primarily to increased VMT and trip generation. Operations ROG and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Concurrent Construction and Operations

The intensity of concurrent construction and net partial operational emissions for the CEQA Reduced Density Alternative with or without the Variant would be the same, except for ROG emissions during Phase 4. Table 3.3-40 summarizes estimated unmitigated ROG emissions from concurrent construction and net partial operational emissions during Phase 4 under the Variant. Emissions of all other pollutants during all other construction years would be the same as presented in Table 3.3-34 for the CEQA Reduced Density Alternative. Emissions from existing land uses (Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives*) are subtracted from the operational results. Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA.

The intensity of combined ROG emissions during Phase 4 would be comparable to those generated under the CEQA Reduced Density Alternative. The impact conclusions for all analysis years and pollutants would be the same as the CEQA Reduced Density Alternative, and combined construction and net partial operational emissions of the Variant would exceed the following Air District thresholds (see Tables 3.3-34 and 3.3-40):

- Average daily and annual ROG: 2035 to 2040
- Average daily and annual NO_X: 2032 to 2036 and 2038 through 2040
- Average daily and annual PM_{10}: 2038 and 2039

The analysis indicates that combined construction and net partial operational emissions would exceed the Air District's ROG, NO_X, and PM_{10} thresholds even with project design features. Combined ROG, NO_X, and PM_{10} emissions above the Air District's threshold are considered potentially significant under CEQA before mitigation.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] The intensity of construction for the CEQA Reduced Density Alternative with or without the Variant would be the same, except for architectural coatings during Phase 4. Emissions of all pollutants except ROG during Phase 4 (2037–2040) would be the same as presented in Table 3.3-34 for the CEQA Reduced Density Alternative. For Phase 4 (2037–2040), results reflect construction emissions (Table 3.3-38) plus operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in future years. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] Presents the total emissions estimate during each year of construction.

[e] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

ROG = reactive organic gases

Mitigation Measures

The following mitigation measure(s) are required during construction.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

Mitigation Measure AQ-4. Low VOC Coatings during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/ EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

The following mitigation measure(s) are required during operations.

Mitigation Measure AQ-5. Low-VOC Non-Residential Coatings and Cleaning Supplies during Operations

Mitigation Measure AQ-6. Electric Landscaping Equipment during Operations

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-1 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

The following mitigation measure is required during concurrent construction and partial operations. Mitigation Measures AQ-1 through AQ-6, GHG-1, and TRAN-1 are also required.

Mitigation Measure AQ-7. Offset Combined Construction and Net Partial Operational ROG and PM_{10} Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Significance After Mitigation

Construction

Mitigation Measures AQ-1 and AQ-2 would be required to reduce NO_X emissions from off-road equipment and on-road vehicles, respectively. Mitigation Measure GHG-1 would also achieve NOx reductions through idling limitations, local sourcing of materials, and other BMPs. Mitigation Measures AQ-3 are required to comply with the Air District's basic fugitive dust control measures and EIMP. Mitigation Measure AQ-4 would also be required during construction to address overlapping construction and partial operational emissions, which are assessed under *Concurrent Construction and Operations*.

As discussed above, the intensity of NO_X emissions generated by construction of CEQA Reduced Density Alternative with or without the Variant would be the same. Table 3.3-35 above summarizes estimated construction emissions for the CEQA Reduced Density Alternative with Mitigation Measures AQ-1 and AQ-4. Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls) for the reasons discussed above under *Construction* for the CEQA Proposed Project. Mitigation Measures AQ-3 and HAZ-1 do not directly reduce ROG, NO_X, or PM exhaust. The table indicates that construction of the Variant would not exceed the Air District's average daily NO_X threshold with Mitigation Measure AQ-1. Mitigation Measures AQ-2 and GHG-1 would achieve additional NOx reductions beyond those shown in the table. Mitigation Measures AQ-3 and HAZ-1 ensure compliance with the Air District's fugitive dust control threshold. Mitigation Measure AQ-4 would further reduce ROG emissions from architectural coatings. Because mitigated construction emissions would not exceed the Air District's thresholds, the Variant would not result in cumulatively considerable increase to regional pollution in the SFBAAB. This impact is less than significant with mitigation under CEQA.

Full Operations

Mitigation Measures AQ-5 and AQ-6 are required to reduce ROG emissions from area sources. Mitigation Measure AQ-6 would also reduce operational NO_X, PM_{10}, and $PM_{2.5}$ emissions. Mitigation Measure TRAN-1 would require enhancements to the project-specific TDM plan to further reduce trips and VMT, and this measure would reduce mobile source emissions. Table 3.3-41 summarizes estimated emissions for the Variant under full-build conditions with Mitigation Measures AQ-5, AQ-6, and TRAN-1. The net emissions are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-41 indicates that ROG and PM_{10} emissions would still exceed the Air District's thresholds with project design features and mitigation. The project design features and Mitigation Measures AQ-5, AQ-6, and TRAN-1 collectively represent best-available control strategies to reduce operational emissions resulting from buildout of a large-scale development project. For the reasons discussed above for the CEQA Proposed Project, there is no feasible mitigation beyond these measures and the project design features to reduce operational ROG and PM_{10} emissions below the Air District's thresholds. Consequently, the impact on air quality from ROG and PM_{10} emissions during operation of the Variant would be significant and unavoidable.

Concurrent Construction and Operations

Mitigation Measures AQ-1 through AQ-6, HAZ-1, GHG-1, and TRAN-1 are required to reduce NO_X, ROG, and PM_{10} emissions during concurrent construction and partial operations. As discussed above, the intensity of concurrent construction and net partial operational emissions for the CEQA Reduced Density Alternative with or without the Variant would be the same, except for ROG emissions during Phase 4. Table 3.3-42 summarizes estimated mitigated ROG emissions from concurrent construction and net partial operational emissions during Phase 4 under the Variant. Emissions of all other pollutants during all other construction years would be the same as presented in Table 3.3-37 for the CEQA Reduced Density Alternative. Table 3.3-42 includes anticipated emissions benefits from Mitigation Measures AQ-1, AQ-3 through AQ-6, and TRAN-1 (Mitigation Measures AQ-2, HAZ-1, and GHG-1 are not quantified or fully quantified for the reasons discussed above under *Construction* for the CEQA Proposed Project). Total net emissions during each analysis year are compared to the Air District's project-level thresholds to determine significance under CEQA.

The analysis indicates that project design features and Mitigation Measures AQ-1 through AQ-6, HAZ-1, GHG-1, and TRAN-1 would reduce NO_X emissions to below Air District thresholds. However, as shown in Tables 3.3-37 and 3.3-42, ROG and PM_{10} emissions would remain elevated. Mitigation Measure AQ-7 is required to offset ROG emissions in 2039 and PM_{10} emissions in 2038 to levels below Air District thresholds. Mitigation Measure AQ-7 ensures that ROG and PM_{10} generated by combined construction and partial operation of the Variant would not exceed Air District thresholds. As such, neither ROG nor PM_{10} emissions would contribute a cumulatively considerable significant level of air pollution such that regional air quality within the SFBAAB would be degraded. However, for the reasons described above, ROG and PM_{10} emissions during project operations after the 6 years of overlapping construction and operations would not be mitigated to a less-than-significant and less-than-cumulatively considerable level. This impact would be significant and unavoidable.

Air District Threshold [e]	54	54	82	54	10	10	15	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG, NOx, and PM have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Emissions results include Mitigation Measures AQ-5, AQ-6, and TRAN-1. Exceedances of Air District thresholds (if any) are shown in **bold** with underline.

[b] Total emissions consist of exhaust and fugitive dust emissions.

[c] The mitigation analysis conservatively assumes only use of low-VOC paints (i.e., less than 50 grams per liter VOC), which is required, at a minimum, by Mitigation Measure AQ-5. The measure would also require no-VOC paints (i.e., less than 5 grams per liter of VOC) where locally (i.e., within 50 miles of the Project Site) and commercially available for the coating type. Where no-VOC paints are used, emissions would be less than presented above.

[d] Refer to Table 5-5 in Section 5.5.7.1, *CEQA No-Project/Existing Conditions Alternative,* in Chapter 5, *Other CEQA Information and Alternatives,* for emissions by source.

[e] Total project (2041) emissions minus total existing (2024) emissions.

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

NO_X = nitrogen oxides; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; PM_{10} = particulate matter 10 microns or less in diameter; ROG = reactive organic gases

Air District Threshold [f]	54	10

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.3.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026 and operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in future years would be lower than the years modeled. Accordingly, the analysis reflects a conservative representation of emissions. Mobile source emissions of ROG have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Values are rounded to the nearest whole number. Exceedances of Air District thresholds (if any) are shown in **bold** with underline. Emissions results include Mitigation Measures AQ-1, AQ-4 through AQ-6, and TRAN-1. Mitigation Measures AQ-2 and HAZ-1 are not quantified and Mitigation Measure GHG-1 is partially quantified (off-road engine controls). Mitigation Measures AQ-3 and HAZ-1 would not reduce ROG emissions.

[b] The intensity of construction for the CEQA Reduced Density Alternative with or without the Variant would be the same, except for architectural coatings during Phase 4. Emissions of all pollutants except ROG during Phase 4 (2037–2040) would be the same as presented in Table 3.3-37 for the CEQA Reduced Density Alternative. For Phase 4 (2037–2040), results reflect construction emissions plus operational emissions from buildings constructed during Phases 1 through 3. Operational emissions were quantified under 2038 opening conditions and held constant in future years. Emissions from existing land uses (Table 5-5) are subtracted from the operational results.

[c] Presents the average emissions estimate during a single day of construction in each year.

[d] Presents the total emissions estimate during each year of construction.

[e] Unrounded value is below threshold (9.6 tons per year).

[f] In developing the thresholds, the Air District considered levels at which project emissions are cumulatively considerable. Consequently, exceedances of project-level thresholds would be cumulatively considerable under CEQA.

ROG = reactive organic gases

Potential Health Outcomes of Cumulatively Considerable Regional Criteria Pollutant Emissions

The potential health outcomes of cumulatively considerable ROG and PM_{10} emissions generated during operation of the Variant are the same as described above for the CEQA Proposed Project.

Impact CEQA-AIR-3: Would the project expose sensitive receptors to substantial pollutant concentrations?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant (expose receptors to substantial localized carbon monoxide) Potentially Significant (expose receptors to substantial toxic air contaminants and localized particulate matter)	AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction AQ-2. Zero-Emission On-Road Vehicles during Construction AQ-3. Fugitive Dust Control AQ-8. Enhanced Dust Control AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction GHG-1. Best Management Practices for Construction-Related GHG Emissions HAZ-1. Implement the Environmental Issues Management Plan TRAN-1. Mitigated TDM Plan that Further Reduces VMT	Less than Significant with Mitigation (expose receptors to substantial toxic air contaminants) Significant and Unavoidable with Mitigation (expose receptors to substantial localized particulate matter)
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Less than Significant (expose receptors to substantial localized carbon monoxide) Potentially Significant (expose receptors to substantial toxic air contaminants and localized particulate matter)	Same as CEQA Proposed Project	Less than Significant with Mitigation (expose receptors to substantial toxic air contaminants) Significant and Unavoidable with Mitigation (expose receptors to substantial localized particulate matter)
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Expose Sensitive Receptors to Substantial Localized Carbon Monoxide Concentrations

Continuous engine exhaust may elevate localized CO concentrations. Certain people exposed to CO hot spots may have a greater likelihood of developing health effects such as fatigue, headaches, confusion, dizziness, and chest pain. CO hot spots are typically observed at heavily congested roadway intersections where a substantial number of gasoline-powered vehicles idle for prolonged durations throughout the day. Construction sites are less likely to result in localized CO hot spots due to the nature of construction activities, which normally utilize diesel-powered equipment for intermittent or short durations. Accordingly, this analysis focuses on potential CO hot spots associated with changes in vehicle traffic during operations.

CO hot spots are typically observed at heavily congested intersections where a substantial number of gasoline-powered vehicles idle for prolonged durations throughout the day. The Air District's screening criteria for CO hot spots is 44,000 vehicles per hour at affected intersections and 24,000 vehicles per hour at affected intersections where vertical or horizontal mixing is limited (i.e., a tunnel). Projects electing to apply these screening criteria must be consistent with an applicable CMP. Traffic volumes at none of the affected intersections would exceed 24,000 vehicles per hour, nor are any study area intersections covered by a CMP.[47] Thus, the CEQA Proposed Project meets the Air District's CO screening criteria and would not contribute to any new localized violations of the health-protective NAAQS or CAAQS for CO. This impact is less than significant under CEQA.

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

DPM is a carcinogen contained in the exhaust of diesel internal-combustion engines. Project-related construction activities would generate DPM (i.e., PM_{10} exhaust from diesel vehicles)[48] from the use of off-road equipment and heavy-duty trucks. PM_{10} exhaust and $PM_{2.5}$ exhaust and fugitive dust emissions would be generated from the use of off-road equipment, on-site soil movement, and heavy-duty trucks and worker vehicles traveling on paved and unpaved roads. Construction of the WRF Option or CUP Option would include the same TAC and $PM_{2.5}$ sources as the CEQA Proposed Project, with a small increase in construction emissions during years 2038 and 2039 and 2035 and 2036, respectively.

Operational activities would generate DPM from the use of delivery trucks and other heavy-duty vehicles traveling to and from the site, and the testing and use of Tier 4 emergency generators. $PM_{2.5}$ emissions would be generated by all vehicles traveling to and from the site, and testing and operation of emergency generators and cooling towers. Laboratories would generate ROG-based TACs. All these activities could expose on-site receptors (future residents and employees associated with the proposed project within the Project Site) and off-site receptors (existing and future residents and employees outside of the Project Site, but located within 1,000 feet of the Project Site) to incremental increases in health risks. Operation of the WRF Option or CUP Option would include the same TAC and $PM_{2.5}$ sources as the CEQA Proposed Project, althought they would both operate one additional emergnecy generator. Fewer cooling towers would also be operated under the CUP Option, and these would be centralized at the CUP facility.

[47] Tan, Valerie. Senior transportation planner, Fehr & Peers. May 20, 2025—email message to ICF regarding BSC Moffett (tech report and Draft EIR/EIS kick-off).

[48] Per Air District guidance, PM10 exhaust is used as a surrogate for DPM.

Health impacts from exposure to DPM include cancer risks and chronic non-cancer risks. Health impacts from exposure to ROG-based TACs include cancer risks, chronic non-cancer risks, and acute non-cancer risks. In addition, the HRA includes an evaluation of annual concentrations of $PM_{2.5}$.

Tables 3.3-43 through 3.3-45 present the maximum unmitigated health risks from construction and operations of the CEQA Proposed Project, CEQA Proposed Project with the WRF Option, and CEQA Proposed Project with the CUP Option, respectively, for off-site and on-site receptors under the five scenarios in Section 3.3.6.2, *Health Risk Assessment.* Health risks are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-43. Estimated Unmitigated Project-Level Health Risk Results from Modeled Scenarios for the CEQA Proposed Project

Receptor Type	Cancer Risk (cases per million)[f]	Non-Cancer Chronic Risk[f]	Non-Cancer Acute Risk[f]	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$)[f]
Scenario 1—Exposure Starting at Beginning of Construction Phase 1[a]

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.
Note: Exceedances of thresholds are indicated with bold and underlined text. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; µg/m3 = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] For Scenario 1, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 17 years of operations for an off-site resident. For an off-site worker, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 12 years for operations.

[b] For Scenario 2, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years of construction and 21 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years and 9.0 years of construction, respectively, and 16 years for operations.

[c] For Scenario 3, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years of construction and 24 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years and 6.0 years of construction, respectively, and 19 years for operations.

[d] For Scenario 4, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years of construction and 27 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years and 3.0 years of construction, respectively, and 22 years for operations.

[e] For Scenario 5, the evaluation of cancer risk was modeled for an exposure duration with 30 years of operations for off-site and on-site residents. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 25 years for operations. Both residential and worker receptors were conservatively modeled for each scenario (i.e., Scenarios 1 to 4) with an additional 0.5 year of exposure duration (resulting in 25.5 years for workers and 30.5 years for residents) to cover any short period of time where both construction and operation may occur concurrently.

[f] Construction plus operational emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenario 5.

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with bold and underlined text. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; µg/m3 = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] For Scenario 1, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 17 years of operations for an off-site resident. For an off-site worker, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 12 years for operations.

[b] For Scenario 2, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years of construction and 21 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years and 9.0 years of construction, respectively, and 16 years for operations.

[c] For Scenario 3, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years of construction and 24 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years and 6.0 years of construction, respectively, and 19 years for operations.

[d] For Scenario 4, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years of construction and 27 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years and 3.0 years of construction, respectively, and 22 years for operations.

[e] For Scenario 5, the evaluation of cancer risk was modeled for an exposure duration with 30 years of operations for off-site and on-site residents. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 25 years for operations. Both residential and worker receptors were conservatively modeled for each scenario (i.e., Scenarios 1 to 4) with an additional 0.5 year of exposure duration (resulting in 25.5 years for workers and 30.5 years for residents) to cover any short period of time where both construction and operation may occur concurrently.

[f] Construction plus operational emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenario 5.

As shown in Tables 3.3-43 through 3.3-45, there would be exceedances of the Air District project-level cancer risk threshold in Scenarios 1, 2, and 4, and exceedances of the Air District $PM_{2.5}$ threshold in Scenarios 1 through 4 for existing off-site residential receptors due to unmitigated project construction and operational activities. For future on-site worker receptors, there would be exceedances of the project-level cancer risk threshold in Scenarios 2 and 4, and exceedances of the

$PM_{2.5}$ threshold in Scenarios 2 through 4 due to unmitigated project construction and operational activities. There would be no exceedances of thresholds during Scenario 5.

The primary cause of the cancer risk threshold for existing receptors is exposure to DPM during construction at the site, specifically exhaust from off-road equipment and on-site trucks, with smaller contributions from operational sources of TACs. The primary causes of the $PM_{2.5}$ concentration exceedances are on-site off-road equipment activity, earthmoving activities, and vehicle travel, which generates fugitive $PM_{2.5}$ from resuspended road dust.

Because non-cancer risks (chronic and acute) would not exceed the Air District's thresholds, these risks would be less than significant. However, cancer risk and annual $PM_{2.5}$ concentrations above the Air District's thresholds during construction and are considered potentially significant under CEQA before mitigation.

Mitigation Measures

The following mitigation measure(s) are required.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-3. Fugitive Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Dust Control

All project contractor(s) comply with the Air District's current enhanced control measures for fugitive dust. The Air District's current enhanced control measures are drawn from their 2023 CEQA Guidelines, Table 5-3, and are identified below. The requirement to comply with the control measures shall be identified in construction bids.

- Limit the simultaneous excavation, grading, and ground-disturbing construction activities occurring within 1,000 feet of one another.
- Install wind breaks (e.g., trees, fences) on the windward side(s) of actively disturbed areas of construction. Wind breaks should have at maximum 50 percent air porosity.
- Plant vegetative ground cover (e.g., fast-germinating native grass seed) in disturbed areas as soon as possible and watered appropriately until vegetation is established.
- Install sandbags or other erosion control measures to prevent silt runoff to public roadways from sites with a slope greater than one percent.
- Minimize the amount of excavated material or waste materials stored at the site.
- Hydroseed or apply non-toxic soil stabilizers to construction areas, including previously graded areas, that are inactive for at least 10 calendar days.

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

The Project Proponent or its contractor(s) shall provide educational material for on-site workers on ways to reduce emissions exposure during construction of the proposed project as part of a pre-construction advisory that precedes construction of each phase. These materials shall provide recommendations to on-site workers (i.e., future employees of the proposed project) to reduce their exposure while indoors and outdoors. The information shall include recommendations to reduce emissions exposure and examples include the following:

- Keep doors and windows closed when working inside and active construction is taking place.
- Ensure any heating, ventilation, and air-conditioning (HVAC) systems in buildings on the Project Site are operating and fully functional when indoors.
- Ensure any Minimum Efficiency Reporting Value (MERV) 13 (or higher) filter systems in buildings on the Project Site are in working order.
- Avoid standing or taking breaks in the vicinity of idling diesel-powered construction equipment associated with the proposed project.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/ EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

Mitigation Measures AQ-1 through AQ-3, HAZ-1, and GHG-1 are required to minimize construction cancer and $PM_{2.5}$ risks. Mitigation Measure AQ-8 is required to further reduce $PM_{2.5}$ exposure during construction. The measure outlines the Air District's enhanced fugitive dust controls, which the Air District (2023:5-5) recommends are implemented when $PM_{2.5}$ exceeds thresholds and would occur near sensitive land uses. Mitigation Measure AQ-9 would provide education and guidance to construction workers on best practicies to reduce exposure to TAC during on-site work. Mitigation Measure TRAN-1 is required to reduce operations $PM_{2.5}$ risks. Collectively, these measures would reduce emissions directly generated by the CEQA Proposed Project and associated receptor exposure and health risks.

Table 3.3-46 presents the maximum mitigated cancer risk and annual $PM_{2.5}$ concentrations for the CEQA Proposed Project (with and without the WRF Option or CUP Option) for off-site and on-site

receptors under the five scenarios in Section 3.3.6.2, *Health Risk Assessment.* Mitigated non-cancer risks (chronic and acute) are not presented because these were determined to be less than significant (see Tables 3.3-43 through 3.3-45). The mitigated analysis accounts for anticipated reductions achieved by Mitigation Measures AQ-1, AQ-3, and TRAN-1. Mitigation Measures AQ-2, HAZ-1, and GHG-1 are not quantified or not fully quantified for the reasons discussed under Impact CEQA-AIR-2. While Mitigation Measure AQ-8 would reduce $PM_{2.5}$ in the form of fugitive dust, specific emission reductions are not quantifiable, as advised by the Air District in its CEQA Guidelines and, therefore, are not accounted for in the results presented in Table 3.3-46.

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with bold and underlined text. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; µg/m3 = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] For Scenario 1, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 17 years of operations for an off-site resident. For an off-site worker, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 12 years for operations.

[b] For Scenario 2, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years of construction and 21 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years and 9.0 years of construction, respectively, and 16 years for operations.

[c] For Scenario 3, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years of construction and 24 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years and 6.0 years of construction, respectively, and 19 years for operations.

[d] For Scenario 4, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years of construction and 27 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years and 3.0 years of construction, respectively, and 22 years for operations.

[e] For Scenario 5, the evaluation of cancer risk was modeled for an exposure duration with 30 years of operations for off-site and on-site residents. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 25 years for operations. Both residential and worker receptors were conservatively modeled for each scenario (i.e., Scenarios 1 to 4) with an additional 0.5 year of exposure duration (resulting in 25.5 years for workers and 30.5 years for residents) to cover any short period of time where both construction and operation may occur concurrently.

[f] Construction plus operational emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenario 5.

Table 3.3-46 indicates that while mitigation would reduce cancer risks to less than significant, $PM_{2.5}$ concentrations would remain above the Air District $PM_{2.5}$ threshold during Scenarios 2 through 4, mainly due to construction $PM_{2.5}$ emissions, which are temporary in nature, at future on-site worker receptor locations. Pursuant to the California Building Code, the proposed project building heating, ventilation, and air conditioning (HVAC) units must have an air filtration system with air filters with a designated efficiency equal to or greater than Minimum Efficiency Reporting Value (MERV) 13 when tested in accordance with ASHRAE Standard 52.2.[49] Studies indicate that MERV-13 air filters can remove 75 to 90 percent of indoor particulate matter that is 0.3 microns in diameter or larger.[50, 51] DPM has the peak particle size at around 0.1 microns, indicating that the MERV 13 filters will tend to have a DPM removal efficiency of less than 75 percent. Therefore, a conservative assumption is that that MERV 13 filters would reduce the exposure of on-site receptors to $PM_{2.5}$ concentrations by 60 percent.

The maximum reported mitigated $PM_{2.5}$ concentration occurs under the CEQA Proposed Project with WRF option (see Table 3.3-46). Applying a MERV-13 removal efficiency of 60 percent would reduce the maximum reported annual $PM_{2.5}$ concentration to 0.18 µg/m^3, which is below the Air District's threshold of 0.3. However, HVAC units must be running for the filters to work, and their efficacy is reduced when windows are opened, or workers and residents are outdoors. Mitigation

[51] Bay Area Air District. 2016. Planning Healthy Places *A Guidebook for addressing local sources of air pollutants in community planning.* May. Available: https://www.baaqmd.gov/~/media/files/planning-and-research/planning-healthy-places/php_may20_2016-pdf.pdf. Accessed: October 9, 2025.

Measure AQ-9 requires implementation of safe work practices during construction to promote the efficacy of the MERV-13 filters and to minimize exposure to $PM_{2.5}$ emissions. However, it is not possible to ensure complete compliance with such measures and the impact determination does not rely on the 60 percent reduction in PM2.5 from operation of the project's MERV-13 filters.

Given that the full efficacy of project mitigation is not quantified, and benefits of MERV 13 air filters are not included in the analysis, $PM_{2.5}$ concentrations are likely to be lower than presented in Table 3.3-46. Nevertheless, to ensure risks are not underestimated under the most conservative exposure scenario, this analysis concludes that $PM_{2.5}$ exposure would exceed the Air District's threshold even after incorporation of Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, GHG-1, and TRAN-1. These measures collectively represent best-available control strategies to reduce receptor exposure to emissions resulting from buildout of a large-scale development project. There is no further mitigation available, and this impact is significant and unavoidable.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project.

Expose Sensitive Receptors to Substantial Localized Carbon Monoxide Concentrations

Overall, there would be no difference in the impact conclusion between the CEQA Proposed Project and the CEQA Proposed Project with the Variant. While liminating residential land uses under the Variant would increase VMT by about 2 percent compared to the CEQA Proposed Project, the Variant would meet the Air District's screening criteria. Thus, it would not contribute to any new localized CO hot spots. This impact is less than significant under CEQA.

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

The CEQA Proposed Project with the Variant would include the same TAC and $PM_{2.5}$ sources as the CEQA Proposed Project, with no appreciable difference in maximum emissions during construction (Scenarios 1 through 4), although the locations of some emission sources and receptors would differ. Operational (Scenario 5) TAC and $PM_{2.5}$ emissions associated with the Variant are similar to the CEQA Proposed Project, although the CEQA Proposed Project with the Variant would result in slightly less $PM_{2.5}$ concentration mainly because truck deliveries are no longer concentrated at the Building 12 loading dock. The estimated maximum cancer risk and non-cancer risks under the CEQA Proposed Project with the Variant for all modeled scenarios would be the same as presented in Table 3.3-43 for the CEQA Proposed Project. The maximum estimated $PM_{2.5}$ concentrations would differ slightly, primarily because of the change in distribution of $PM_{2.5}$ emissions with the Variant. The unmitigated annual $PM_{2.5}$ results for the CEQA Proposed Project with the Variant are presented in Table 3.3-47.

Table 3.3-47. Estimated Unmitigated Annual $PM_{2.5}$ Concentrations from Modeled Scenarios for the CEQA Proposed Project with the Variant

Receptor Type	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$) [a]
Scenario 1 – Exposure Starting at Beginning of Construction Phase 1 [a]	
MEIR, existing off-site	**0.35**
MEIR, on-site	NA
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 2 – Exposure Starting at Beginning of Construction Phase 2 [b]	
MEIR, existing off-site	**0.35**
MEIR, on-site	**0.93**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 3 – Exposure Starting at Beginning of Construction Phase 3 [c]	
MEIR, existing off-site	**0.35**
MEIR, on-site	**0.93**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 4 – Exposure Starting at Beginning of Construction Phase 4 [d]	
MEIR, existing off-site	**0.35**
MEIR, on-site	**0.93**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 5 – Exposure to Project Buildout Operations [e]	
MEIR, existing off-site	0.04
MEIR, on-site	0.06
Significance Threshold	0.3
Exceeds Threshold?	No

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with bold and underlined text. Refer to Table 3.3-33 for estimated unmitigated cancer and non-cancer risks. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of $PM_{2.5}$ that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; $\mu g/m^3$ = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] Construction plus operational emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenario 5.

Tables 3.3-46 and 3.3-47 indicate that there would be exceedances of the Air District project-level cancer risk threshold in Scenarios 1, 2, and 4, and exceedances of the Air District $PM_{2.5}$ threshold in Scenarios 1 through 4 for existing off-site residential receptors due to unmitigated project construction and operational activities. For future on-site worker receptors, there would be exceedances of the project-level cancer risk threshold in Scenarios 2 and 4, and exceedances of the $PM_{2.5}$ threshold in Scenarios 2 through 4 due to unmitigated project construction and operational activities. There would be no exceedances of thresholds during Scenario 5.

Because non-cancer risks (chronic and acute) would not exceed the Air District's thresholds, these risks would be less than significant. However, cancer risk and annual $PM_{2.5}$ concentrations above the Air District's thresholds during construction are considered potentially significant under CEQA before mitigation.

Mitigation Measures

The following mitigation measure(s) are required.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-3. Fugitive Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/ EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, and GHG-1 are required to minimize construction cancer and $PM_{2.5}$ risks. Mitigation Measure TRAN-1 is required to reduce operations $PM_{2.5}$ risks. Collectively, these measures would reduce emissions directly generated by the proposed project and associated receptor exposure and health risks. As discussed above, estimated cancer and non-cancer health risks would be the same as presented for the CEQA Proposed Project (see Table

3.3-46). Annual $PM_{2.5}$ concentrations would differ slightly. The mitigated annual $PM_{2.5}$ results for the CEQA Proposed Project with the Variant are presented in Table 3.3-48. The mitigated analysis accounts for anticipated reductions achieved by Mitigation Measures AQ-1, AQ-3, and TRAN-1. Mitigation Measures AQ-2, HAZ-1, and GHG-1 are not quantified or not fully quantified for the reasons discussed under Impact CEQA-AIR-2. While Mitigation Measure AQ-8 would reduce $PM_{2.5}$ in the form of fugitive dust, specific emission reductions are not quantifiable, as advised by the Air District in its CEQA Guidelines and, therefore, are not accounted for in the results presented in Table 3.3-48. In addition, Mitigation Measure AQ-9 (which would likely reduce PM2.5 to below the Air District's threshold) is not accounted for in the results presented in Table 3.3-48.

Table 3.3-48. Estimated Mitigated Annual $PM_{2.5}$ Concentrations from Modeled Scenarios for the CEQA Proposed Project with the Variant

Receptor Type	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$) [a]
Scenario 1 – Exposure Starting at Beginning of Construction Phase 1 [a]	
MEIR, existing off-site	0.13
MEIR, on-site	NA
Significance Threshold	0.3
Exceeds Threshold?	No
Scenario 2 – Exposure Starting at Beginning of Construction Phase 2 [b]	
MEIR, existing off-site	0.13
MEIR, on-site	**0.39**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 3 – Exposure Starting at Beginning of Construction Phase 3 [c]	
MEIR, existing off-site	0.13
MEIR, on-site	**0.39**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 4 – Exposure Starting at Beginning of Construction Phase 4 [d]	
MEIR, existing off-site	0.13
MEIR, on-site	**0.39**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 5 – Exposure to Project Buildout Operations [e]	
MEIR, existing off-site	0.04
MEIR, on-site	0.06
Significance Threshold	0.3
Exceeds Threshold?	No

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with bold and underlined text. Refer to Table 3.3-41 for estimated mitigated cancer and non-cancer risks. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; µg/m3 = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] Construction plus operational emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenario 5.

Tables 3.3-46 and 3.3-48 indicate that while mitigation would reduce cancer risks to less than significant, $PM_{2.5}$ concentrations would remain above the Air District $PM_{2.5}$ threshold during Scenarios 2 through 4 mainly due to construction PM2.5 emissions, which are temporary in nature, at future on-site worker receptor locations.

As discussed above for the CEQA Proposed Project, MERV-13 air filters would be installed in all on-site buildings. Applying a MERV-13 removal efficiency of 60 percent would reduce the maximum reported annual $PM_{2.5}$ concentration for the Variant to 0.15 µg/m^3. HVAC units must be running for the filters to work, and their efficacy is reduced when windows are opened, or workers and are outdoors. Accordingly, this analysis does not account for MERV-13 filters or implementation of Mitigation Measure AQ-9 in the final impact determination.

Given that the full efficacy of project mitigation is not quantified, and benefits of MERV 13 air filters are not included in the analysis, $PM_{2.5}$ concentrations are likely to be lower than presented in Tables 3.3-46 and 3.3-48. Nevertheless, to ensure risks are not underestimated under the most conservative exposure scenario, this analysis concludes that $PM_{2.5}$ exposure would exceed the Air District's threshold even after incorporation of Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, GHG-1, and TRAN-1. These measures collectively represent best-available control strategies to reduce receptor exposure to emissions resulting from buildout of a large-scale development project. There is no further mitigation available, and this impact is significant and unavoidable.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Expose Sensitive Receptors to Substantial Localized Carbon Monoxide Concentrations

Overall, there would be no difference in the impact conclusion between the CEQA Proposed Project and the CEQA Reduced Density Alternative. Vehicle traffic and associated mobile-source emissions would be lower under the CEQA Reduced Density Alternative. The CEQA Reduced Density Alternative would meet the Air District's screening criteria and thus would not contribute to any new localized CO hot spots. This impact is less than significant under CEQA.

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

The CEQA Reduced Density Alternative would include the same TAC and $PM_{2.5}$ sources as the CEQA Proposed Project, with a small decrease in construction emissions during each phase of construction. Operational TAC and $PM_{2.5}$ emissions associated with the CEQA Reduced Density Alternative are likewise slightly lower due to reduced truck deliveries.

Table 3.3-49 presents the maximum unmitigated health risks for the CEQA Reduced Density Alternative for off-site and on-site receptors under the five scenarios in Section 3.3.6.2, *Health Risk Assessment.* Health risks are compared to the Air District's project-level thresholds to determine significance under CEQA.

Table 3.3-49. Estimated Unmitigated Project-Level Health Risk Results from Modeled Scenarios for the CEQA Reduced Density Alternative

Receptor Type	Cancer Risk (cases per million)[f]	Non-Cancer Chronic Risk[f]	Non-Cancer Acute Risk[f]	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$)[f]

Exceeds Threshold?	No	No	No	No

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with **bold and underlined** text. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; $\mu g/m^3$ = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] For Scenario 1, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 17 years of operations for an off-site resident. For an off-site worker, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 12 years for operations.

[b] For Scenario 2, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years of construction and 21 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years and 9.0 years of construction, respectively, and 16 years for operations.

[c] For Scenario 3, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years of construction and 24 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years and 6.0 years of construction, respectively, and 19 years for operations.

[d] For Scenario 4, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years of construction and 27 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years and 3.0 years of construction, respectively, and 22 years for operations.

[e] For Scenario 5, the evaluation of cancer risk was modeled for an exposure duration with 30 years of operations for off-site and on-site residents. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 25 years for operations. Both residential and worker receptors were conservatively modeled for each scenario (i.e., Scenarios 1 to 4) with an additional 0.5 year of exposure duration (resulting in 25.5 years for workers and 30.5 years for residents) to cover any short period of time where both construction and operation may occur concurrently.

[f] Construction plus operational emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenario 5.

As shown in Table 3.3-49, there would be exceedances of the Air District project-level cancer risk threshold in Scenarios 1, 2, and 4, and exceedances of the Air District $PM_{2.5}$ threshold in Scenarios 1 through 4 for existing off-site residential receptors due to unmitigated project construction and operational activities. For future on-site worker receptors, there would be exceedances of the project-level cancer risk threshold in Scenarios 2 and 4, and exceedances of the $PM_{2.5}$ threshold in Scenarios 2 through 4 due to unmitigated project construction and operational activities. There would be no exceedances of thresholds during Scenario 5.

Because non-cancer risks (chronic and acute) would not exceed the Air District's thresholds, these risks would be less than significant. However, cancer risk and annual $PM_{2.5}$ concentrations above the Air District's thresholds during construction are considered potentially significant under CEQA before mitigation.

Mitigation Measures

The following mitigation measure(s) are required.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/ EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, and GHG-1 are required to minimize construction cancer and $PM_{2.5}$ risks. Mitigation Measure TRAN-1 is required to reduce operations $PM_{2.5}$ risks. Collectively, these measures would reduce emissions directly generated by the proposed project and associated receptor exposure and health risks. Table 3.3-50 presents the maximum mitigated cancer risk and annual $PM_{2.5}$ concentrations for the CEQA Reduced Density Alternative for off-site and on-site receptors under the five scenarios in Section 3.3.6.2, *Health Risk Assessment.* Mitigated non-cancer risks (chronic and acute) are not presented because they were determined to be less than significant (Table 3.3-49). The mitigated analysis accounts for anticipated reductions achieved by Mitigation Measures AQ-1, AQ-3, and TRAN-1. Mitigation Measures AQ-2, AQ-8, AQ-9, HAZ-1, and GHG-1 are not quantified or not fully quantified for the reasons discussed above for the CEQA Proposed Project.

Table 3.3-50. Estimated Mitigated Project-Level Cancer Risk and $PM_{2.5}$ Concentration Results from Modeled Scenarios for the CEQA Reduced Density Alternative

Receptor Type	Cancer Risk (cases per million)[f]	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$)[f]
Scenario 1—Exposure Starting at Beginning of Construction Phase 1[a]		
MEIR, existing off-site	3.0	0.11
MEIR, on-site	NA	NA
Significance Threshold	10.0	0.3
Exceeds Threshold?	No	No
Scenario 2—Exposure Starting at Beginning of Construction Phase 2[b]		
MEIR, existing off-site	3.6	0.11
MEIR, on-site	5.5	**0.36**
Significance Threshold	10.0	0.3
Exceeds Threshold?	No	Yes
Scenario 3—Exposure Starting at Beginning of Construction Phase 3[c]		
MEIR, existing off-site	3.0	0.11
MEIR, on-site	5.2	**0.36**
Significance Threshold	10.0	0.3
Exceeds Threshold?	No	Yes

Receptor Type	Cancer Risk (cases per million)[f]	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$)[f]
Scenario 4—Exposure Starting at Beginning of Construction Phase 4[d]		
MEIR, existing off-site	8.4	0.11
MEIR, on-site	8.9	**0.36**
Significance Threshold	10.0	0.3
Exceeds Threshold?	No	Yes
Scenario 5—Exposure to Project Buildout Operations[e]		
MEIR, existing off-site	1.7	0.02
MEIR, on-site	4.8	0.03
Significance Threshold	10.0	0.3
Exceeds Threshold?	No	No

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with **bold and underlined** text. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; $\mu g/m^3$ = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] For Scenario 1, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 17 years of operations for an off-site resident. For an off-site worker, the evaluation of cancer risk was modeled for an exposure duration with 13.5 years of construction and 12 years for operations.

[b] For Scenario 2, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years of construction and 21 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 9.5 years and 9.0 years of construction, respectively, and 16 years for operations.

[c] For Scenario 3, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years of construction and 24 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 6.5 years and 6.0 years of construction, respectively, and 19 years for operations.

[d] For Scenario 4, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years of construction and 27 years of operations for an off-site resident. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 3.5 years and 3.0 years of construction, respectively, and 22 years for operations.

[e] For Scenario 5, the evaluation of cancer risk was modeled for an exposure duration with 30 years of operations for off-site and on-site residents. For off-site and on-site workers, the evaluation of cancer risk was modeled for an exposure duration with 25 years for operations. Both residential and worker receptors were conservatively modeled for each scenario (i.e., Scenarios 1 to 4) with an additional 0.5 year of exposure duration (resulting in 25.5 years for workers and 30.5 years for residents) to cover any short period of time where both construction and operation may occur concurrently.

[f] Construction plus operational emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to cancer risk, hazard indices, and annual $PM_{2.5}$ concentrations are shown for Scenario 5.

Table 3.3-50 indicates that while mitigation would reduce cancer risks to less than significant, $PM_{2.5}$ concentrations would remain above the Air District $PM_{2.5}$ threshold during Scenarios 2 through 4.

As discussed above for the CEQA Proposed Project, MERV-13 air filters would be installed in all on-site buildings. Applying a MERV-13 removal efficiency of 60 percent would reduce the maximum reported annual $PM_{2.5}$ concentration for the CEQA Reduced Density Alternative to 0.14 $\mu g/m^3$. HVAC units must be running for the filters to work, and their efficacy is reduced when windows are opened, or workers and residents are outdoors. Accordingly, this analysis does not account for MERV-13 filters or implementation of Mitigation Measure AQ-9in the final impact determination.

Given that the full efficacy of project mitigation is not quantified, and benefits of MERV 13 air filters are not included in the analysis, $PM_{2.5}$ concentrations are likely to be lower than presented in Table

3.3-50. Nevertheless, to ensure risks are not underestimated under the most conservative exposure scenario, this analysis concludes that $PM_{2.5}$ exposure would exceed the Air District's threshold even after incorporation of Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, GHG-1, and TRAN-1. These measures collectively represent best-available control strategies to reduce receptor exposure to emissions resulting from buildout of a large-scale development project. There is no further mitigation available, and this impact is significant and unavoidable.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative.

Expose Sensitive Receptors to Substantial Localized Carbon Monoxide Concentrations

Overall, there would be no difference in the impact conclusion between the CEQA Proposed Project and the CEQA Reduced Density Alternative and the CEQA Reduced Density Alternative with the Variant. Vehicle traffic and associated mobile-source emissions would be lower under the Variant, relative to the CEQA Proposed Project. The Variant would meet the Air District's screening criteria and thus would not contribute to any new localized CO hot spots. This impact is less than significant under CEQA.

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

The CEQA Reduced Density Alternative with the Variant would include the same TAC and $PM_{2.5}$ sources as the CEQA Reduced Density Alternative, with no appreciable difference in maximum emissions during construction (Scenarios 1 through 4), although the locations of some emission sources and receptors would differ. Operational (Scenario 5) TAC and $PM_{2.5}$ emissions associated with the Variant are similar to the CEQA Reduced Density Alternative, although the CEQA Reduced Density Alternative with the Variant would result in slightly greater $PM_{2.5}$ emissions. The estimated maximum cancer risk and non-cancer risks under the CEQA Reduced Density Alternative with the Variant for all modeled scenarios would be the same as presented in Table 3.3-49 for the CEQA Reduced Density Alternative. The maximum estimated $PM_{2.5}$ concentrations would differ slightly, primarily because of the increased $PM_{2.5}$ contribution during operations. The unmitigated annual $PM_{2.5}$ results for the CEQA Reduced Density Alternative with the Variant are presented in Table 3.3-51.

Table 3.3-51. Estimated Unmitigated Annual $PM_{2.5}$ Concentrations from Modeled Scenarios for the CEQA Reduced Density Alternative with the Variant

Receptor Type	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$) [a]
Scenario 1 – Exposure Starting at Beginning of Construction Phase 1 [a]	
MEIR, existing off-site	**0.35**

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with bold and underlined text. Refer to Table 3.3-49 for estimated unmitigated cancer and non-cancer risks. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; µg/m3 = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] Construction plus operational emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenario 5.

Tables 3.3-49 and 3.3-51 that there would be exceedances of the Air District project-level cancer risk threshold in Scenarios 1, 2, and 4, and exceedances of the Air District $PM_{2.5}$ threshold in Scenarios 1 through 4 for existing off-site residential receptors due to unmitigated project construction and operational activities. For future on-site worker receptors, there would be exceedances of the project-level cancer risk threshold in Scenarios 2 and 4, and exceedances of the $PM_{2.5}$ threshold in Scenarios 2 through 4 due to unmitigated project construction and operational activities. There would be no exceedances of thresholds during Scenario 5.

Because non-cancer risks (chronic and acute) would not exceed the Air District's thresholds, these risks would be less than significant. However, cancer risk and annual $PM_{2.5}$ concentrations above the Air District's thresholds during construction are considered potentially significant under CEQA before mitigation.

Mitigation Measures

The following mitigation measure(s) are required.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

Mitigation Measure AQ-3. Fugitive Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2.

Mitigation Measure AQ-8. Enhanced Dust Control

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure AQ-9. Promote Safe Work Practices to Limit Emissions Exposure During Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-3.

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1 in Section 3.8, *Greenhouse Gas Emissions*, of this joint EIR/ EIS.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Expose Sensitive Receptors to Substantial Toxic Air Contaminants and Localized Particulate Matter

Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, and GHG-1 are required to minimize construction cancer and $PM_{2.5}$ risks. Mitigation Measure TRAN-1 is required to reduce operations $PM_{2.5}$ risks. Collectively, these measures would reduce emissions directly generated by the proposed project and associated receptor exposure and health risks. As discussed above, estimated cancer and non-cancer risks during Scenarios 1 through 4 would be the same as presented for the CEQA Reduced Density Alternative (Table 3.3-50). Annual $PM_{2.5}$ concentrations would differ slightly, primarily because of the increased $PM_{2.5}$ contribution during operations. The mitigated annual $PM_{2.5}$ results for the CEQA Reduced Density Alternative with the Variant are presented in Table 3.3-52.

The mitigated analysis accounts for anticipated reductions achieved by Mitigation Measures AQ-1, AQ-3, and TRAN-1. Mitigation Measures AQ-2, HAZ-1, and GHG-1 are not quantified or not fully quantified for the reasons discussed under Impact CEQA-AIR-2. While Mitigation Measure AQ-8 would reduce $PM_{2.5}$ in the form of fugitive dust, specific emission reductions are not quantifiable, as advised by the Air District in its CEQA Guidelines. In addition, Mitigation Measure AQ-9 (which would likely reduce PM2.5 to below the Air District's threshold) is not accounted for in the results presented in Table 3.3-48.

Table 3.3-52. Estimated Mitigated Annual $PM_{2.5}$ Concentrations from Modeled Scenarios for the CEQA Reduced Density Alternative with the Variant

Receptor Type	Annual $PM_{2.5}$ Concentrations ($\mu g/m^3$) [a]
Scenario 1 – Exposure Starting at Beginning of Construction Phase 1 [a]	
MEIR, existing off-site	0.12
MEIR, on-site	NA
Significance Threshold	0.3
Exceeds Threshold?	No
Scenario 2 – Exposure Starting at Beginning of Construction Phase 2 [b]	
MEIR, existing off-site	0.12
MEIR, on-site	**0.39**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 3 – Exposure Starting at Beginning of Construction Phase 3 [c]	
MEIR, existing off-site	0.12
MEIR, on-site	**0.39**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 4 – Exposure Starting at Beginning of Construction Phase 4 [d]	
MEIR, existing off-site	0.12
MEIR, on-site	**0.39**
Significance Threshold	0.3
Exceeds Threshold?	Yes
Scenario 5 – Exposure to Project Buildout Operations [e]	
MEIR, existing off-site	0.03
MEIR, on-site	0.06
Significance Threshold	0.3
Exceeds Threshold?	No

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: Exceedances of thresholds are indicated with bold and underlined text. Refer to Table 3.3-49 for estimated mitigated cancer and non-cancer risks. As noted in Section 3.3.6.2, *Health Risk Assessment*, the health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

MEIR = Maximally Exposed Individual Receptor; µg/m3 = micrograms per cubic meter; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

[a] Construction plus operational emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenarios 1 through 4. Operational-only emissions contributions to annual $PM_{2.5}$ concentrations are shown for Scenario 5.

Tables 3.3-50 and 3.3-52 indicate indicate that while mitigation would reduce cancer risks to less than significant, $PM_{2.5}$ concentrations would remain above the Air District $PM_{2.5}$ threshold during Scenarios 2 through 4.

As discussed above for the CEQA Reduced Density Alternative, MERV-13 air filters would be installed in all on-site buildings. Applying a MERV-13 removal efficiency of 60 percent would reduce the maximum reported $PM_{2.5}$ concentration for the Variant to 0.15 µg/m^3. HVAC units must be running for the filters to work, and their efficacy is reduced when windows are opened, or workers and residents are outdoors. Accordingly, this analysis does not account for MERV-13 filters or implementation of Mitigation Measure AQ-9 in the final impact determination.

Given that the full efficacy of project mitigation is not quantified, and benefits of MERV 13 air filters are not included in the analysis, $PM_{2.5}$ concentrations are likely to be lower than presented in Tables 3.3-50 and 3.3-52. Nevertheless, to ensure risks are not underestimated under the most conservative exposure scenario, this analysis concludes that $PM_{2.5}$ exposure would exceed the Air District's threshold even after incorporation of Mitigation Measures AQ-1 through AQ-3, AQ-8, AQ-9, HAZ-1, GHG-1, and TRAN-1. These measures collectively represent best-available control strategies to reduce receptor exposure to emissions resulting from buildout of a large-scale development project. There is no further mitigation available, and this impact is significant and unavoidable.

Impact CEQA-AIR-4: Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

The generation and severity of odors is dependent on a number of factors, including the nature, frequency, and intensity of the source, wind direction, and the location of the receptor(s). Odors rarely cause physical harm, but can cause discomfort, leading to complaints to regulatory agencies.

Sources of odor during construction include diesel exhaust from construction equipment, asphalt paving, and application of architectural coatings. All odors would be localized, generally confined to the immediate area surrounding the construction site and would cease once construction activities have been completed. Construction of the CEQA Proposed Project (with or within the WRF Option or CUP Option) would use typical construction techniques. The equipment odors would be typical of most construction sites, temporary, and localized to the vicinity of the construction work area.

Further, construction activities would be subject to Air District rules that limit the amount of ROG emissions from architectural coatings and asphalt paving material, which can help reduce odors. Accordingly, construction is not anticipated to generate substantial odors that would result in violations of the Air District's odor complaint threshold or adversely affect a substantial number of people. This impact is less than significant under CEQA.

Land uses associated with operational odor complaints typically include landfills, wastewater treatment facilities, and animal processing centers.[52,53] The proposed project would include new academic, research, retail, administrative, parking, and short-term housing uses. None of these uses are associated with long-term sources of substantial odors, as identified by the Air District or CARB. As a result, operation of the CEQA Proposed Project (with or within the WRF Option or CUP Option) would not result in substantial odor impacts on existing or future receptors that would lead to violations of the Air District's odor compliant threshold or adversely affect a substantial number of people. This impact is less than significant under CEQA.

Mitigation Measures

No mitigation is required for this impact.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project.

Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Proposed Project with the Variant. The potential for odor exposure may be reduced under the Variant because there would be no on-site residential receptors. This impact is less than significant under CEQA.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Reduced Density Alternative. The potential for odor exposure may be reduced under the CEQA Reduced Density Alternative because there would be less construction. This impact is less than significant under CEQA.

Mitigation Measures

No mitigation is required for this impact.

53 California Air Resources Board. 2005. *Air Quality and Land Use Handbook: A Community Health Perspective.* April. Sacramento, CA.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative.

Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Reduced Density Alternative compared to the CEQA Reduced Density Alternative with the Variant. The potential for odor exposure may be reduced under the Variant because there would be no on-site residential receptors. This impact is less than significant under CEQA.

Mitigation Measures

No mitigation is required for this impact.

3.3.8 Cumulative Impacts

The discussion of cumulative impacts addresses the topics evaluated in the corresponding project impacts in Section 3.3.7, *Impacts and Mitigation Measures*, above. The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. The evaluation of regional air quality impacts is an inherently cumulative approach because criteria pollutants, once emitted, mix into the atmosphere and affect a larger area than any individual project site. Thus, the regional air quality analysis does not consider individual planned projects in the vicinity of the proposed project. Rather, it uses the same thresholds as the project-level thresholds developed by the Air District, which are based on projections of future development compared to existing conditions. Criteria pollutant emissions that exceed air quality thresholds under modeled conditions are considered to reflect the cumulative impacts resulting from contributors within the SFBAAB. Exceedance of project-level thresholds indicates that there would be both a project-level and a cumulative impact.

The evaluation of localized air quality impacts from receptor exposure to CO hot spots and odors likewise considers project-level thresholds. The Air District's CO screening criteria are based on total intersection volumes and thus consider the proposed project's potential to cumulatively contribute to CO hot spots within the transportation network. The Air District's odor threshold is based community complaints against an individual facility, and thus evaluation of this threshold does not require identification of individual cumulative projects in the vicinity of construction and operational activities. Exceedance of the project-level CO and odor thresholds indicates that there would be both a project-level and a cumulative impact.

The evaluation of localized air quality impacts from receptor exposure to TACs considers the proposed project's incremental TAC risk and cumulative TAC risks from sources within 1,000 feet of the proposed project. The Air District considers projects to have a cumulatively considerable TAC impact if they contribute to TAC emissions that, when combined with cumulative sources within

1,000 feet of sensitive receptors, result in excess cancer risk levels of more than 100 in 1 million or a hazard index greater than 10.0.[54]

Impact CEQA-C-AIR-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to regional or local air quality (including receptor exposure to pollution and odors)? (Significant and Unavoidable)

Regional Air Quality

Santa Clara County does not currently attain the NAAQS or CAAQS for ozone and $PM_{2.5}$, or the CAAQS for PM_{10}, reflecting an existing significant cumulative impact. Because impacts from criteria pollutants are cumulative in nature, the project-level and cumulative impact thresholds for the analysis of regional air quality impacts are the same. Thus, the analysis and conclusions presented in Impact CEQA-AIR-2 characterize the cumulative regional air quality impacts of the proposed project. Emissions generated by the proposed project during the construction period would not contribute to a cumulative regional air quality impact under CEQA with mitigation. However, long-term operational emissions of ROG and PM_{10} would be cumulatively considerable under CEQA even after all feasible mitigation. This impact is significant and unavoidable.

Localized Air Quality

As discussed above in Impact CEQA-AIR-3, the proposed project meets the Air District's CO screening criteria and is not expected to contribute to any new localized CO hot spots. Likewise, buildout of the proposed project would not result in new or worsened odors that would affect a substantial number of people. Odors from construction diesel exhaust, paving activities, and architectural coatings, as well as limited operational operations would be similar to those generated by the surrounding environment, which includes adjacent residential, commercial, and aviation land uses, as well as traffic on U.S. 101. There is no existing significant cumulative odor impact from these sources in the vicinity of the Project Site. Accordingly, the proposed project's contribution to localized CO hot spots and odors would not be cumulatively considerable. This impact is less than significant.

Consistent with Air District guidance[55], a cumulative HRA was performed to assess potential health risks to sensitive receptors from exposure to TAC and $PM_{2.5}$ generated by the proposed project and background emission sources within 1,000 feet of the proposed project. The proposed project risk results (see Section 3.3.7) were used to identify the maximally affected receptor location for each of the health endpoints analyzed in the HRA (i.e., cancer risk, non-cancer risk, and annual $PM_{2.5}$ concentration). The greatest project cancer and non-cancer risk and $PM_{2.5}$ concentration is observed at the same receptor location. Cumulative health risks were determined by adding the total contribution from background sources to the modeled project risks at the location. Adding the highest project result to the total background risk provides a worst-case assessment and ensures cumulative health risks in the study area are not underreported.

The results of the cumulative impact assessment are summarized in Table 3.3-53. The proposed project contribution includes implementation of Mitigation Measures AQ-1, AQ-3, and TRAN-1 (Mitigation Measures AQ-2, AQ-8, AQ-9, GHG-1 are not quantified or not fully quantified).

Exceeds threshold?	**No**	**No**	**No**	**Yes**

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

$PM_{2.5}$ = particulate matter with a diameter of 2.5 microns or less; µg/m3 = micrograms per cubic meter

Note: Exceedances of thresholds are indicated with underlined text. As noted in Section 3.3.6.2, *Health Risk Assessment*, the project-level health risk assessment modeling accounts for mobile source emissions of PM2.5 that have been adjusted to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations.

[a] Represents the receptor with the highest project cancer, non-cancer risk, and $PM_{2.5}$ risk (future on-site, Scenarios 1 through 4). The receptor is located at UTM x, y: 583597.32, 4140578.25.

[b] Contribution from Air District permitted facilities and existing and planned sources on the NASA Ames property (see Table 3.3-5). Note that the background risks presented in this table may not match what is presented in Table 3.3-5. This is because Table 3.3-5 presents the background risk at the facility fenceline, whereas this table presents the combined background risk at the modeled receptor location. Air District Facility number 550-REM contributes the majority of Stationary Source cancer risk (30 per one million) and $PM_{2.5}$ concentration (4.4 ug/m^3). 550-REM represents the combined emissions of 37 generators rather than a single unit, so the modeled health risks will naturally appear higher than the individually located units. The higher impact is therefore a modeling artifact of the aggregation rather than an indication that any single generator within that group has unusually high emissions or parameters.

[c] Total background sources plus project. Values may not add due to rounding.

As shown in Table 3.3-53, background sources in combination with the proposed project would exceed the Air District's cumulative $PM_{2.5}$ concentration threshold. Background sources result in a $PM_{2.5}$ concentration above the Air District's cumulative threshold of 0.8 µg/m^3. The proposed project would contribute an additional 0.36 to 0.44 µg/m^3, depending on the alternative, resulting in a total maximum concentration of 4.97 to 5.04 µg/m^3.

As discussed in Section 3.3.7, buildings constructed at the Project Site are required to install MERV-13 air filters. Applying a MERV-13 removal efficiency of 60 percent would reduce the maximum annual $PM_{2.5}$ concentration to between 1.99 to 2.02 µg/m^{3}and would be above the Air District's cumulative threshold of 0.8 µg/m^3 However, HVAC units must be running for the filters to work, and their efficacy is reduced when windows are opened, or workers and residents are outdoors. Even with implementation of Mitigation Measure AQ-9, effective operation of the HVAC system cannot be guaranteed, and accordingly, this analysis does not account for MERV-13 benefits. Cumulative $PM_{2.5}$ concentrations at the maximally affected receptor location would be cumulatively considerable. This impact is significant and unavoidable and the proposed project's contribution to the impact cumulatively considerable.

3.4 Biological Resources

3.4.1 Introduction

This section evaluates the potential impacts on plant, wildlife, and wetland resources that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Project Site as well as the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical studies prepared for the project.

- *Berkeley Space Center at NASA Research Park Biological Resources Technical Report* (Biological Resources Technical Report) prepared by ICF, April 2026 (Appendix 3.4-1 of this joint environmental impact report/environmental impact statement [EIR/EIS])
- *Berkeley Space Center at NASA Research Park Aquatic Resources Delineation Report* (Aquatic Resources Delineation) prepared by ICF, April 2026 (Appendix 3.4-2 of this joint EIR/EIS)

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. NOP/NOI comments pertaining to biological resources include a recommendation to protect biological resources and minimize wildlife habitat degradation. This issue is addressed below in Section 3.4.7, *Impacts and Mitigation Measures*. In addition, the regional manager of the California Department of Fish and Wildlife (CDFW), Bay Delta Region, recommended the following:

- Within *Environmental Setting* section, include a full list or a table that notes the species' common name, scientific name, state/federal listing status, and habitat type preference and provides a determination regarding the potential to occur for all special-status species;
- Conduct baseline habitat assessments,
- Use California Natural Diversity Database (CNDDB) and previous studies performed in the area
- Determine if the Project Site contains special-status species or has the potential to support special-status species and if an incidental take permit (ITP) may be required
- Provide recommended mitigation for nesting birds
- Provide recommended mitigation for roosting bats
- Provide recommended mitigation measure for Crotch's bumble bee
- Provide recommended mitigation measure for western burrowing owl

These recommendations are addressed in detail in the Biological Resources Technical Report, and applicable mitigation measures are included under Impact CEQA-BIO-1.

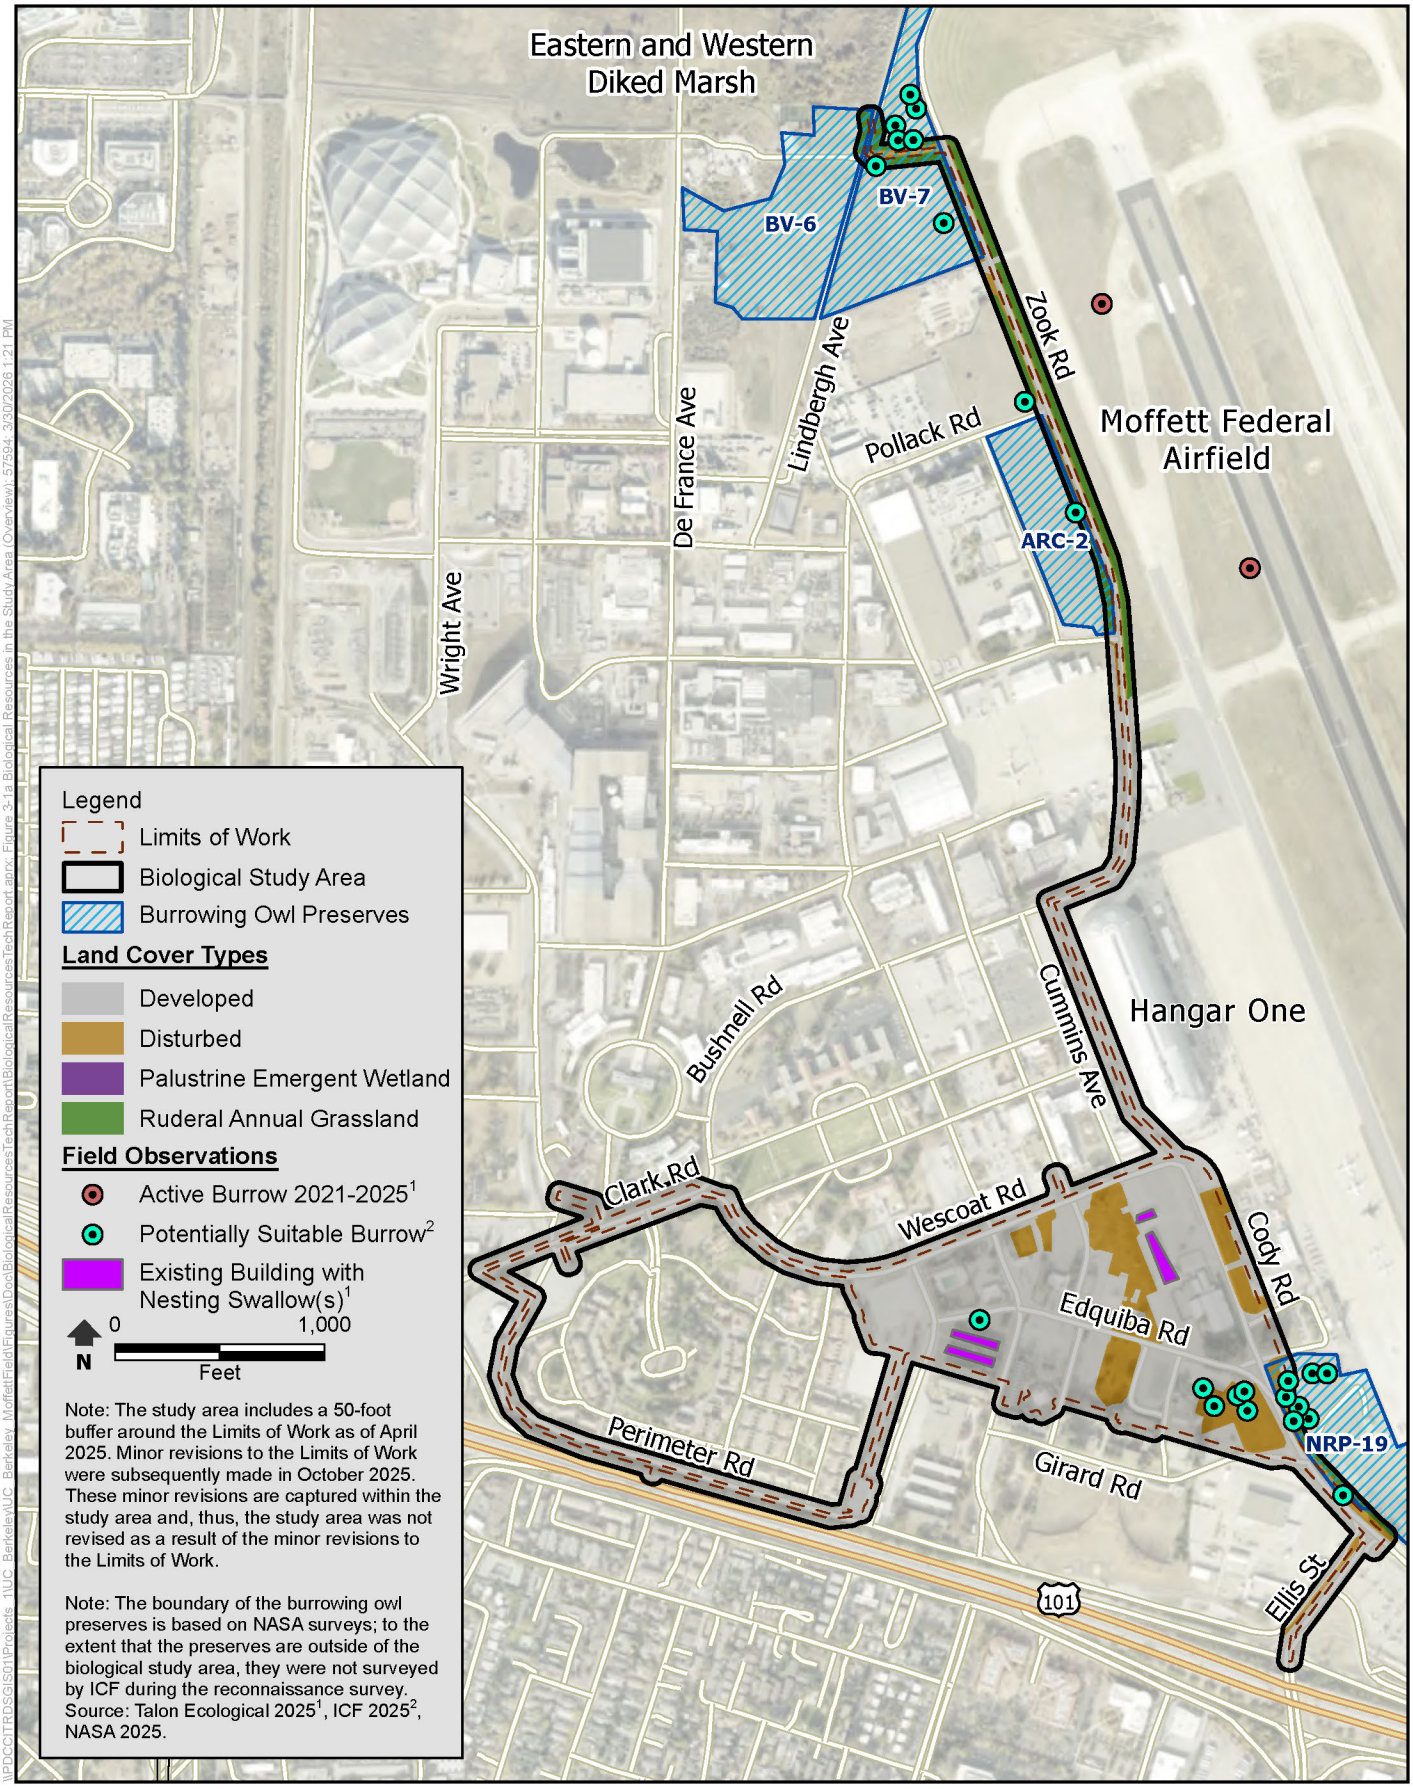
3.4.2 Affected Environment/Environmental Setting

For the purposes of analyzing biological resources, the study area is defined as the Limits of Work plus a 50-foot buffer ("Biological Resources Study Area") to encompass all areas in which temporary or permanent impacts could occur for construction of the project components and in which indirect effects on biological resources could result. Figure 3.4-1 shows the biological resources in the Biological Resources Study Area.

Regional Setting

The proposed project is located on the San Francisco Peninsula in the Central Coast subregion of the California Floristic Province (Jepson Flora Project 2026). This region of California generally experiences wet, cool winters and dry, warm summers. The proposed project is approximately 2.7 mile south of the open waters of San Francisco Bay on relatively flat ground, with elevations ranging from approximately 5 to 36 feet above mean sea level. There are two soil map units in the Biological Resources Study Area —Urbanland-Hangerone complex, 0 to 2 percent slopes, drained, and Embarcadero silty clay loam, drained, 0 to 2 percent slopes.

Project Site



The Project Site is on federal land within the National Aeronautics and Space Administration's Ames Research Center (NASA ARC), an approximately 2,000-acre facility between U.S. 101 and the southwest edge of San Francisco Bay in Santa Clara County, California. Mountain View borders NASA ARC to the north and southwest, and Sunnyvale borders NASA ARC to the southeast and east. NASA ARC is approximately 33 miles south of San Francisco and 8 miles north of San José.

The approximately 45-acre Limits of Work comprises the approximately 39-acre Project Site and approximately 6 acres of off-site areas (Off-Site Areas) where utility improvements and building demolition would occur. The Off-Site Areas are primarily within NASA ARC. The Project Site is relatively flat, with existing grades gradually sloping from south to north. The site is currently covered with a substantial amount of impervious hardscape. This includes roads, surface parking lots, streets, and paths, which, in total, cover approximately 70 percent of the site. Existing landscaping includes approximately 245 trees, which are located throughout the Project Site. Additional land cover within the Biological Resources Study Area includes native perennial grassland, ruderal annual grassland, and according to the Aquatic Resource Delineation Report 0.014 acre of palustrine emergent wetland. Disturbed areas such as vacant lots and road fringes with bare soil or low vegetation cover due to management [spraying] or excessive anthropogenic disturbance, are also present.

Critical Habitat

Critical habitat refers to areas designated by the U.S. Fish and Wildlife Service (USFWS) that include physical or biological features essential for the conservation of species listed as threatened or endangered under the Endangered Species Act (ESA). When a species is proposed for listing under the ESA, USFWS considers whether there are certain areas essential to the conservation of the species. There is no critical habitat within the Biological Resources Study Area.

Special-Status Plant Species

In response to queries of the California Native Plant Society online Inventory of Rare and Endangered Plants of California and a search of the U.S. Geological Survey (USGS) Mountain View 7.5-minute quadrangle, CNDDB records from a 2-mile radius around the Limits of Work, and the USFWS Information for Planning and Consultation (IPaC) database, seven special-status plant species were determined to have the potential to occur in the Biological Resources Study Area. Of these, five were considered absent due to the lack of suitable habitat: California androsace (*Androsace elongata* ssp*. acuta*; California Rare Plant Rank [CRPR] 4.2), Point Reyes salty bird's-beak (*Chloropyron maritimum* ssp. *palustre*; CRPR 1B.2), Santa Clara red ribbons (*Clarkia concinna* ssp*. automixa*; CRPR 4.3), Hoover's button-celery (*Eryngium aristulatum* var*. hooveri*; CRPR 1B.1), and California seablite (*Suaeda californica*; federal endangered, CRPR 1B.1). Alkali milk vetch (*Astragalus tener* var*. tener*; CRPR 1B.2) has low potential to occur, and Congdon's tarplant (*Centromadia parryi* ssp*. congdonii*; CRPR 1B.1) has high potential to occur in the ruderal grasslands, based on habitat requirements and specimen records in the vicinity.

Special-Status Wildlife Species

Fourteen special-status wildlife species were determined to have moderate to high potential to occur in the Biological Resources Study Area following CNDDB and USFWS IPaC database searches and observations during biological surveys. The wildlife species consist of Crotch's bumble bee (*Bombus crotchii*; California ESA [CESA] candidate), monarch butterfly (*Danaus plexippus*; federal ESA proposed), northwestern pond turtle (*Actinemys marmorata*; federal ESA proposed), snowy egret (*Egretta thula*), northern harrier (*Circus cyaneus*; California Species of Special Concern [SSC], USFWS Bird of Conservation Concern [BCC]), white-tailed kite (*Elanus leucurus*; California Fully Protected [FP]), California Ridgway's rail (*Rallus longirostris obsoletus*; federal ESA, CESA endangered, California FP), western burrowing owl (*Athene cunicularia hypugaea*; CESA candidate, California SSC, USFWS BCC), Alameda song sparrow (*Melospiza melodia pusillula*; California SSC, USFWS BCC), tricolored blackbird (*Agelaius tricolor*; CESA threatened, USFWS BCC), saltmarsh common yellowthroat (*Geothlypis trichas sinuosa*; California SSC, USFWS BCC), pallid bat (*Antrozous pallidus*; California SSC, Western Bat Working Group [WBWG] priority species), Townsend's big-eared bat (*Corynorhinus townsendii*; California SSC, WBWG), and hoary bat (*Lasiurus cinereus*; WBWG).

Sensitive Natural Communities

Sensitive natural communities are those natural communities with limited distribution statewide or within a county or region and often vulnerable to environmental effects of projects. Sensitive natural communities are part of California's Natural Heritage Program, as maintained in the CNDDB; impact assessments are required under the California Endangered Species Act (CESA) and the California Environmental Quality Act (CEQA) Guidelines. Natural communities with ranks of S1 to S3 are considered sensitive. Certain types of waters of the State and waters of the United States are also considered sensitive natural communities. Sensitive natural communities in the Biological Resources Study Area include the native perennial grassland (S3) and the palustrine emergent wetland (S3). These features are 47 feet and 33 feet outside of the Limits of Work, respectively.

Wetland and Other Waters of the United States and Waters of the State

One palustrine emergent wetland that was dominated by creeping wildrye (*Elymus triticoides*) and Himalayan blackberry (*Rubus armeniacus*) was mapped within the Biological Resources Study Area. This feature is part of a larger stormwater retention pond that does not share a surface connection with any other body of water. The palustrine emergent wetland is 33 feet outside of the Limits of Work.

Wildlife Corridors-

Wildlife corridors are described as pathways or habitat linkages that connect discrete areas of natural open space that would otherwise be separated or fragmented by topography, changes in vegetation, or other natural or man-made obstacles, such as urbanization. The Biological Resources Study Area is located along the Pacific Flyway, an important route between breeding and wintering grounds for many migratory birds. One habitat linkage, the Bay Wetlands Missing Linkage, extends from just north and west of the Biological Resources Study Area northward along the west side of San Francisco Bay to just north of the Candlestick Point State Recreation Area. However, this linkage does not overlap the Biological Resources Study Area and would not be affected by the project.

Migratory Birds

Migratory birds, including raptors, have the potential to nest in the scattered trees and shrubs present in the Biological Resources Study Area as well as on the ground within and in the vicinity of the Biological Resources Study Area. Although migratory bird species are not considered special-status wildlife species, their occupied nests and eggs are protected by California Fish and Game Code Sections 3503 and 3503.5 and the Migratory Bird Treaty Act (MBTA). The generally accepted nesting season extends from February 1 through September 30.

Roosting Bats

Bats have the potential to occupy buildings and trees in the Biological Resources Study Area while roosting throughout the year; bats have also been recorded using cliff and barn swallow nests year-round[1]. Take of nongame mammals, including bats, is prohibited under California Fish and Game Code Section 4150, except as provided elsewhere in the California Fish and Game Code. Maternity season for bats typically extends from April to May through August to October.

Habitat Conservation Plans

Habitat conservation plans (HCPs) are required as part of an application for an ITP under Section 10 of the ESA. Although the proposed project is not subject to HCPs, an analysis of potential impacts on habitat conservation plans is included, in accordance with Appendix G of the State of California (State) CEQA Guidelines, to evaluate the proposed project's potential to conflict with the provisions of an applicable adopted HCP, Natural Community Conservation Plan (NCCP),[2] or other approved local, regional, or state HCP. The Project Site is within the Pacific Gas and Electric (PG&E) Bay Area Operations and Maintenance Habitat Conservation Plan, the scope of which is limited to operations

1 California Bat Working Group 2022. *Bats in Swallow Nests*. Revised: April 4, 2022. Available: https://www.calbatwg.org/resources/.https://www.calbatwg.org/resources/. Accessed: June 12, 2025.

2 NCCPs identify the measures necessary to conserve and manage natural biological diversity within a planning area while allowing compatible and appropriate economic development, growth, and other human uses.

and maintenance of PG&E facilities in nine San Francisco Bay Area counties: Sonoma, Marin, Napa, Solano, Contra Costa, Alameda, Santa Clara, San Mateo, and San Francisco.

The Biological Resource Study Area is approximately 7 miles north and west of the area covered by the Santa Clara Valley HCP. The proposed project is not a covered activity under the Santa Clara Valley HCP; however, the Limits of Work overlap with lands at Moffett Federal Airfield identified for burrowing owl management under the Santa Clara Valley HCP/NCCP.[3] The Santa Clara Valley HCP/NCCP is currently being updated in response to the October 10, 2024, decision by the California Fish and Game Commission to grant burrowing owl "candidate" species status under CESA.

3.4.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies.

Plans, policies, and regulations considered in the analysis of the project's impacts related to biological resources are identified in the Biological Resources Technical Report (Appendix 3.4-1 of this joint EIR/EIS). A list of plans, policies, and regulations considered in the analysis is provided below.

- Endangered Species Act
- Migratory Bird Treaty Act
- Executive Order 13186
- Executive Order (EO) 13186, 13112, and 11990
- Section 401 and 404 of the Clean Water Act
- California Endangered Species Act
- California Fish and Game Code

- California Native Plant Protection Act
- Section 401 of the Clean Water Act
- Porter-Cologne Water Quality Control Act
- McAteer-Petris Act
- California Green Building Standards Code Non-Residential Voluntary Measure A5.107—Bird-Friendly Building Design
- Santa Clara Valley Habitat Conservation Plan/Natural Community Conservation Plan
- PG&E Bay Operations and Maintenance Habitat Conservation Plan
- Santa Clara County Heritage Tree Ordinance
- NASA Ames Development Plan

3.4.4 CEQA Findings

The following sections describe the environmental impacts of the proposed project on biological resources in accordance with CEQA. The sections describe the thresholds used to determine whether an impact would be significant and the methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts on biological resources in accordance with NEPA is provided separately in Section 4.5.4, *Biological Resources*, in Chapter 4, *Environmental Impact Statement*.

3.4.5 Thresholds of Significance

In accordance with Appendix G of the State CEQA Guidelines, the project would have the potential to have a significant effect on biological resources if it would result in any of the following conditions.

Would the project:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by CDFW or USFWS?
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW or USFWS?
- Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal areas) through direct removal, filling, hydrological interruption, or other means?
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

- Conflict with the provisions of an applicable adopted HCP, NCCP, or other approved local, regional, or State HCP?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to biological resources?

3.4.6 Methods for Analysis

The methods for the analysis of impacts on biological resources are based on professional standards and information cited throughout the Biological Resources Technical Report (Appendix 3.4-1 of this joint EIR/EIS). The key impacts were identified and evaluated according to the environmental characteristics of the area for the CEQA Proposed Project and the expected magnitude, intensity, and duration of activities related to construction and operation of the proposed project and alternatives.

Direct impacts are those effects that are directly caused by project construction and operation (even if it takes time for the resulting effect to develop). Indirect impacts are those that occur either later in time or at a distance from the project location but are reasonably foreseeable.

Permanent direct impacts on biological resources were quantified using the estimated amount of land cover that would be converted because of construction of new facilities and operation of the project (i.e., use of project facilities and associated utilities and infrastructure). Facility maintenance during project operations would include periodic maintenance for buildings, landscaping, the internal roadway network, and utility infrastructure. Scheduled maintenance activities would be infrequent and would occur in the early evening or morning hours, if possible, to avoid interfering with the project's peak hours of occupancy.

Impacts on biological resources identified within the Biological Resources Study Area were determined with use of geographic information system (GIS) software. The Limits of Work was overlaid on vegetation community data to quantify impacts associated with construction and operation of the proposed project. For construction of the stormwater line for the eastern diked marsh trunk main, the construction area was assumed to be completely within existing roads, with the exception of a 0.01-acre area for the northernmost 40 feet of the outfall.

The wildlife connectivity assessment assembled current data and information related to wildlife movement within the vicinity of the Biological Resources Study Area to qualitatively assess when and where the project could interfere with the movement of any native resident or migratory terrestrial wildlife species.

The CEQA Proposed Project and the CEQA Reduced Density Alternative represent differences in land use but would occur within the same footprints. Therefore, the impacts on biological resources would be the same under the CEQA Proposed Project and the CEQA Reduced Density Alternatives with and without the Variant.

3.4.7 Impacts Not Evaluated in Detail

Conflict with Local Policies or Ordinances Protecting Biological Resources

The Biological Resources Study Area is federally owned land; compliance with the Santa Clara County Heritage Tree Ordinance is not required. The Project Proponent has provided an analysis of the project's adherence to the requirements of the Santa Clara County Heritage Tree Ordinance in

Appendix 3.4-1; this information is provided for informational purposes. The proposed project would not conflict with local policies or ordinances protecting biological resources, resulting in no impact. This topic is not evaluated further.

3.4.8 Impacts and Mitigation Measures

***Impact CEQA-BIO-1*: *Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by CDFW or USFWS*?**

CEQA Proposed Project (NEPA Build Alternative 1)

Effects on Special-Status Plants

As described in Appendix 3.4-1, construction, operations, and maintenance under the CEQA Proposed Project would have a potentially significant impact on special-status plants because of the permanent and temporary loss of habitat and potential for injury and mortality.

Effects on Special-Status Wildlife

Impacts on Monarch Butterfly and Crotch's Bumble Bee

As described in Appendix 3.4-1, construction, operations, and maintenance under the CEQA Proposed Project could result in significant impacts on monarch butterfly because of the permanent and temporary loss of habitat, potential for injury and mortality, and disruption of normal behaviors. Although monarch butterflies do not overwinter at the Project Site, suitable nectar resources are present. Therefore, the species has moderate to high potential to occur. Therefore, impacts on the monarch butterfly would be potentially significant before mitigation.

As described in Appendix 3.4-1 Section 5.3.2.1, construction and operation of the CEQA Proposed Project could result in impacts on Crotch's bumble bee because of the permanent and temporary loss of habitat, potential for injury and mortality, and the disruption of normal behaviors. Therefore, impacts on the Crotch's bumble bee would be potentially significant before mitigation.

Impacts on Northwestern Pond Turtle

As described in Appendix 3.4-1, Section 5.3.2.1, construction of the CEQA Proposed Project could result in impacts on northwestern pond turtle because of the potenital for injury and mortality and the disruption of normal behaviors. Therefore, impacts on the northwestern pond turtle would be potentially significant before mitigation.

Impacts on Burrowing Owl and Other Special-Status Birds

As described in Appendix 3.4-1, construction, operations, and maintenance under the CEQA Proposed Project could result in significant impacts on burrowing owl because of the permanent and temporary loss of habitat, potential for injury and mortality, and disruption of normal behaviors. Therefore, the CEQA Proposed Project could have a significant impact on burrowing owl.

As described in Appendix 3.4-1, construction, operations, and maintenance under the CEQA Proposed Project could result in impacts on other special-status birds because of the potenital for injury and mortality and the disruption of normal behaviors during the breeding season (approximately February 1 through August 31). In addition, some special-status birds (e.g., white-tailed kite, tricolored blackbird, northern harrier, Ridgway's rail, snowy egret) may forage in the ruderal grassland or emergent marsh. Therefore, impacts on other special-status birds would be potentially significant before mitigation. Potential bird collisions with buildings are described below under *Impacts on Terrestrial Wildlife Movement.*

Impacts on Special-Status Bats

As described in Appendix 3.4-1, construction under the CEQA Proposed Project could result in significant impacts on special-status bats because of the permanent and temporary loss of habitat,

potential for injury and mortality, and disruption of normal behaviors. Therefore, impacts on special-status bats would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

All field management and construction personnel shall be trained by a qualified biologist experienced in construction monitoring as to the importance of protecting sensitive natural resources (e.g., special-status plants, birds, and mammals as well as designated critical and/or suitable habitats for these species) prior to any ground-disturbing activity for each construction phase. Preconstruction training shall be conducted so that construction personnel are aware of their responsibilities and the importance of compliance. All trainees shall be required to sign a sheet, indicating their attendance and completion of environmental training. Construction personnel shall be educated on the types of sensitive resources in the project area and the measures required to avoid and minimize impacts on these resources. Materials covered in the training program shall include environmental rules and regulations, along with specific site requirements to limit activities to approved work areas; timing restrictions; and instructions regarding avoidance of sensitive resource areas. In general, the training shall include the following components:

- A review of the special-status species and sensitive habitats that could be found in work areas, including known plant populations, bird nests or bat roosts, if present, and the location of burrowing owl preserves.
- Measures to avoid or minimize impacts on special-status species and their habitats.
- A review of all conditions and requirements of environmental permits, reports, and plans.
- Consequences for violations of the laws and regulations protecting resources.
- Boundaries of the work area.
- Exclusion and construction fencing methods and staking methods to protect resources.
- Roles and responsibilities, including an explanation regarding the authority of biological monitors to stop work, as required by permits and/or project approvals.
- What to do when special-status species are encountered (including dead, injured, stressed, or entrapped individuals) in work areas.

Mitigation Measure BIO-2. Preconstruction Surveys for Special-Status Species

Prior to the start of construction in a work area for the current construction phase, preconstruction surveys shall be conducted for special-status plant and wildlife species by a qualified biologist(s) to inform implementation of avoidance and compensation measures that may be required if special-status species are observed.

Alkali milk-vetch and Congdon's tarplant surveys shall be required in suitable annual grassland habitat within 100 feet of work areas for the current construction phase. The purpose of the surveys is to inform implementation of the avoidance and compensation measures described below if alkali milk-vetch or Congdon's tarplant are observed. Surveys shall be initiated during the identifiable period of the year that precedes construction of each phase and be consistent

with the methods described in *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities*.[4]

Surveys for special-status wildlife species (Crotch's bumble bee, monarch butterfly, northwestern pond turtle, snowy egret, northern harrier, white-tailed kite, California Ridgway's rail, western burrowing owl, Alameda song sparrow, tricolored blackbird, saltmarsh common yellowthroat, pallid bat, Townsend's big-eared bat, and hoary bat) shall be conducted consistent with available established survey protocols for each species, such as in *Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species*,[5] *Staff Report on Burrowing Owl Mitigation*,[6] and *Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions* (Johnston et al. 2019).

Mitigation Measure BIO-3. Exclusion Fencing

Prior to the start of construction in a work area for the current construction phase, the Project Proponent or its contractor(s) shall install high-visibility exclusion fencing and erosion control measures prior to any ground disturbance within 50 feet of environmentally sensitive areas (i.e., potential emergent wetlands, native perennial grassland, special-status species' habitats) under the guidance of a qualified biologist. The fencing shall be installed around the perimeter of native perennial grassland, potential emergent wetlands (potential habitat for Ridgway's rail and northwestern pond turtle), and burrowing owl preserves. Flagging or other visual barriers and/or signs may be installed in place of fencing (e.g. in the case of burrowing owl preserves to prevent perching on fence stakes by avian predators). The contractor, under the supervision of a qualified biologist, shall erect and maintain the exclusion fencing for the duration of the construction activity in that work area. Fencing and erosion control measures shall be inspected and maintained daily by the construction foreman until completion of the construction activity. Status of the fencing and erosion control measures shall also be verified and documented at least once a week by a biological monitor. Fencing shall be removed upon completion of construction activities in that work area and prior to demobilization. Activity exclusion zones for sensitive natural communities shall be a minimum of 50 feet; the zones shall be established around each sensitive natural community, the boundaries of which shall be clearly marked with construction exclusion fencing or its equivalent. The establishment of activity exclusion zones shall not be required if construction-related disturbances shall not occur within 250 feet of the sensitive natural community. The size of activity exclusion zones may be reduced below 50 feet through consultation with a qualified biologist if construction activities are conducted in the presence of a biological monitor.

Mitigation Measure BIO-4. Alkali Milk-Vetch and Congdon's Tarplant

In the event that avoidance of alkali milk-vetch or Congdon's tarplant is not feasible, seeds of alkali milk-vetch and/or Congdon's tarplant shall be collected by a qualified biologist with experience collecting native plant seeds prior to the start of construction in a work area for the

5 California Department of Fish and Wildlife. 2023. *Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species.* Available: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=213150&inline. Accessed: July 14, 2023.

6 California Department of Fish and Game. 2012. *Staff Report on Burrowing Owl Mitigation*. March 7. Sacramento, CA. Available: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=83843. Accessed: June 13, 2025.

current construction phase. Seeds shall be stored and redistributed after the current construction phase is completed. Include the redistributed seeds in the planting palette for on-site restoration of temporarily disturbed grassland and/or the landscape design for open space, as described in the Development Guidelines.

Mitigation Measure BIO-5. Monarch Butterfly Breeding Habitat

Prior to the start of construction in a work area for the current construction phase, botanists shall identify and map locations of milkweed (monarch butterfly breeding habitat). If the Limits of Work overlaps with milkweed plants, milkweed plants shall be removed outside of the breeding season for monarch butterfly (February 15 through October 15). The Project Proponent shall compensate for the permanent loss of milkweed by planting native milkweed in the landscape design for open space at a ratio of 1:1 (one native milkweed planted for each milkweed plant removed) and by including native nectar plants for monarch butterfly such as goldenrods (*Solidago* spp.), asters (*Symphyotrichum* spp.; *Eurybia* spp.), coyotebrush (*Baccharis pilularis*), nettleleaf giant hyssop (*Agastache urticifolia*), yarrow (*Achillea millefolium*), coastal sand verbena (*Abronia latifolia*), bluedicks (*Dichelostemma capitatum*), seaside fleabane (*Erigeron glaucus*), coyote mint (*Monardella villosa*), gumplant (*Grindelia camporum*), and sunflowers (*Helianthus* spp.), among others[7] in planting palettes for on-site restoration of temporarily disturbed grassland and/or the landscape design for open space, as described in the Development Guidelines.

Mitigation Measure BIO-6. Crotch's Bumble Bee

Prior to any phase of construction and as long as the species is considered a candidate for listing under the California Endangered Species Act (CESA) or in the event that they become listed under CESA, a qualified biologist shall assess the work area through a desktop analysis and land cover assessment through site visits to determine whether the work area for the current phase of construction and immediately surrounding landscape within 50 feet has the potential to contain potential habitat for Crotch's bumble bees. This analysis shall identify whether the work area is a developed area with no landscaping (i.e., contains buildings; paved roads, sidewalks or parking lots; other built infrastructure; or mowed and irrigated lawns) or contains open grassland, ornamental landscaping or scrub habitats that could be potential Crotch's bumble bee foraging, nesting, or overwintering habitat.

If habitat suitable for Crotch's bumble bee is determined not to be present within the work area for the construction phase, then further measures would not be required.

If the work area contains suitable Crotch's bumble bee habitat, then the following measures shall be implemented prior to construction of the phase:

- Pre-construction surveys for Crotch's bumble bee and nests shall be conducted within all suitable habitat prior to initial ground-disturbing activities for the current construction phase. Surveys shall follow the survey methodologies set out in the CDFW *Survey Considerations for CESA Candidate Bumble Bee*.[8] The surveys can be phased with project buildout. The purpose of

7 Xerces Society for Invertebrate Conservation. 2025. Monarch Nectar Plants: California, Publication Serial Number 19-046. Version Number 01. Available: https://xerces.org/publications/plant-lists/monarch-nectar-plants-california. Accessed: April 9, 2026.

8 California Department of Fish and Wildlife. 2023. *Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species.*

this survey shall be to identify active nest colonies inside of and within 50 feet of permanent and temporary impact areas. If Crotch's bumble bees are not detected during the pre-construction survey, no additional measures are required.

- If active Crotch's bumble bee nests are present within the Limits of Work or a 50-foot buffer surrounding the Limits of Work, an appropriate no disturbance buffer zone shall be established around the nest to reduce the risk of disturbance or accidental take. The buffer shall provide at least 50 feet of clearance around nest entrances.
    - If establishment of a no-work buffer is feasible, construction activities shall not occur within the no-work buffer until a qualified biologist determines that the colony is no longer active (i.e., no Crotch's bumble bees are seen flying in or out of the nest for three consecutive days, indicating the colony has completed its nesting season, and the next season's queens have dispersed from the colony). Once the nest has been determined inactive, construction activities within the no-work buffer(s) shall be allowed to resume.
    - If avoidance of the nest is not feasible, the Project Proponent or its contractor(s) shall consult with a qualified biologist familiar with Crotch's bumble bee biology, regulations, and conservation for recommendations on appropriate measures. The proposed measures must be approved by the NASA Ames Research Center Environmental Management Division (NASA ARC EMD) prior to proceeding.
- Mowing shall be minimized as much as feasible in suitable Crotch's bumble bee habitat. In areas where mowing is needed, the following measures to minimize potential take of Crotch's bumble bee shall be followed, to the extent feasible:
    - Mow outside of the blooming season (typically March through June), if feasible;
    - Mow at the highest cutting height possible to avoid disturbing nests or overwintering queens;
    - Avoid mowing from noon into the afternoon, the time of day when pollinators are most active; and
    - Mow at speeds less than 8 mph.
- During construction, vehicles on-site shall not exceed a speed of 15 mph. This requirement shall be posted with signage noted throughout the Project Site.

Mitigation Measure BIO-7. Herbicide and Pesticide Use

To minimize impacts on monarch butterfly and Crotch's bumble bee from herbicide and pesticide drift, application shall be limited to areas immediately adjacent to the proposed facilities and shall be conducted using handheld equipment. Herbicides and pesticides shall be applied only by applicators with current licenses and/or certifications from the California Department of Pesticide Regulation. The herbicide applicator shall follow the label directions. Spray nozzles shall be kept within 24 inches of target vegetation during spraying. The most current information on herbicide and pesticide toxicity on wildlife shall be used to inform future decisions about herbicide and pesticide use during operations.

Mitigation Measure BIO-8. Burrowing Owl Surveys

Prior to any ground disturbance for the current construction phase, a qualified biologist shall conduct pre-construction surveys in all areas identified as suitable habitat within 250 feet of the Limits of Work. Surveys shall be performed consistent with the methods described in the *Staff Report on Burrowing Owl Mitigation*.[9] The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the Limits of Work of the construction phase, particularly in areas within 250 feet of construction activities. Surveys shall be initiated no less than 14 days prior to initial construction activities for the phase, and the final survey shall conclude no more than 2 calendar days prior to construction of the phase.

Mitigation Measure BIO-9. Burrowing Owl Avoidance

If active burrowing owl burrows are detected during preconstruction surveys, the following shall apply:

1. No disturbance shall occur within 160 feet of active burrows during the non-breeding season (September 1 through January 31).
2. No disturbance shall occur within 250 feet of active burrows during the breeding season (February 1 through August 31).

If disturbance must occur within the breeding or non-breeding season buffer zones, the Project Proponent or its contractor(s) shall work with NASA Ames Research Center Environmental Management Division (NASA ARC EMD) prior to commencement of activities for each construction phase to adhere to and implement the measures listed below. Alternative measures to avoid impacts may be considered on a case-by-case basis in coordination with NASA ARC EMD and the approved qualified biologist.[10]

Prior to beginning any construction activity for the current construction phase within 250 feet of burrowing owl habitat, NASA ARC EMD must review and approve all vehicular access routes and staging areas.

Mitigation Measure BIO-10. Burrowing Owl Relocation

If occupied burrowing owl burrows cannot be avoided (i.e., disturbance within 160 feet of active burrows during the non-breeding season or 250 feet of active burrows during the breeding season would occur), the following measures shall be implemented in coordination with and subject to the approval of the NASA ARC EMD.

1. Passive Relocation
    a. Timing

[9] California Department of Fish and Game. 2012. *Staff Report on Burrowing Owl Mitigation*. March 7. Sacramento, CA. Available: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=83843. Accessed: June 13, 2025.

[10] As described in the NASA ARC Final Burrowing Owl Habitat Management Plan (Leidos 2022), the qualified biologist must have 1) familiarity with the western burrowing owl biology and its local ecology (i.e., Santa Clara County); 2) at least 2 years of experience with conducting habitat assessments as well as breeding and non-breeding season surveys for burrowing owls, or experience with such surveys conducted under the direction of an experienced western burrowing owl biologist; 3) familiarity with regulations related to burrowing owls and conservation; and 4)experience with analyzing impacts of development on burrowing owls and their habitat.

i. No passive relocation is allowed during the breeding season (February 1 through August 31). The destruction of burrows is only allowed outside the breeding season (September 1 through January 31). All artificial burrows shall be installed prior to the breeding season.

ii. Installation of artificial burrows must occur prior to activities that cause disturbance. A project is not allowed to proceed until NASA ARC EMD has verified the artificial burrows have been installed.

iii. Installation of artificial burrows must occur at least 1 week prior to passive relocation and burrow exclusion activities.

b. Surveys and Banding

i. The approved qualified biologist must conduct multiple surveys for a minimum of 2 weeks prior to the passive relocation. These surveys need to locate active burrows within the Limits of Work and buffer zone, identify satellite burrows outside the buffer zone, and observe owl behavior to establish the territory of the owl.

ii. Before passive relocation occurs, owls should be trapped and banded, at the discretion of the NASA ARC EMD, to track success. At least 2 weeks prior to exclusion, all owls may be banded by an approved qualified biologist who has a minimum of 2 years of bird banding experience and a Federal Bird Banding and Marking Permit.

c. Restrictions

i. Passive relocation should only be allowed if satellite burrows are located outside the 50-foot buffer zone to increase the chances of success. All passive relocation efforts must be coordinated with and approved by NASA ARC EMD.

ii. Burrows associated with ground squirrel colonies (i.e., dense clusters of interconnecting burrows that support multiple ground squirrels) must be protected to the extent they do not conflict with NASA infrastructure protection and aircraft safety requirements.

2. Exclusion Requirements

a. Short-term exclusion (for 1 to 4 weeks) must be avoided to the extent feasible and is only allowed if avoidance measures are not practicable. If short-term exclusion is the only available mechanism, install a one-way door, and once the owl leaves, collapse the burrow within the 1-4 week duration. Long-term exclusion (more than 4 weeks) is prohibited. If exclusion more than 4 weeks is necessary, passive relocation measures shall be implemented.

i. Burrowing owls may only be temporarily excluded from burrows in the Limits of Work and 50-foot buffer zone.

ii. Restoration. Burrows within the Limits of Work and 50-foot buffer that are temporarily excluded (i.e., not destroyed) must be restored to pre-project conditions (e.g., removal of wood blocks/one-way doors, digging out burrows by hand, and relocating squirrels to the area) in coordination with NASA ARC EMD.

b. Exclusion Procedures

i. Exclusion shall be conducted by installing one-way doors in burrow entrances. One-way doors shall be left in place for a minimum of 48 hours to ensure owls have left the burrow before excavation.

ii. The approved qualified biologist shall remove the one-way doors and verify that no owls are present before excavating the burrows. All burrows shall be excavated immediately after removal of the one-way doors.

c. Re-entry Prevention

i. If project activities do not occur within 5 days of removing the one-way doors, the Limits of Work and 250-foot buffer zone shall be resurveyed to verify that burrowing owls have not reoccupied the site.

ii. The Limits of Work and 250-foot buffer zone shall be resurveyed if the site remains inactive for more than 2 weeks during construction to ensure owls have not occupied the site in the interim period between the initial surveys and ground-disturbing activities.

3. Artificial Burrows

a. Replacement Ratio. Active natural and artificial burrows (i.e., burrows that have been active during the breeding season within the last 5 years) that are permanently excluded (i.e., destroyed) shall be replaced with artificial burrows at a 3:1 ratio.

b. Siting and Design. Artificial burrows must be installed within approximately 300 feet of the burrows to be destroyed, if feasible. If this distance is not feasible, the Project Proponent or its contractor(s) must coordinate with the approved qualified biologist to locate alternate sites (e.g., within burrowing owl preserves or other burrowing owl habitat). The location(s) and design of the artificial burrows will be developed in coordination with the NASA ARC EMD prior to installation.

c. Monitoring. Subsequent to installation of artificial burrows, the Limits of Work, buffer zone, and surrounding area must be monitored daily for at least 1 week to confirm owl use of the alternate burrows before destroying burrows in the Limits of Work. Burrow exclusion is not allowed until owl use of the artificial burrows and/or satellite burrows is confirmed by the approved qualified biologist.

d. Management. Activities must be minimized around the new artificial burrows, and these areas need to be managed to provide foraging habitat to the extent possible.

Mitigation Measure BIO-11. Burrowing Owl Habitat

If suitable burrowing owl habitat is temporarily disturbed or permanently lost or degraded (as determined by the qualified biologist and approved by NASA ARC EMD), the following measures shall be implemented.

1. Suitable burrowing owl habitat lost from project impacts shall be replaced at a 3:1 mitigation ratio.
2. All suitable burrowing owl habitat temporarily disturbed by ground-disturbing activities must be restored with native grasses and habitat (e.g., rocks, mulch, berms) to attract native insects and rodents and facilitate repopulation of ground squirrels.
3. The location of habitat restoration area(s) must be approved by the NASA ARC EMD.

4. Initial restoration activities associated with permanent habitat loss must commence prior to construction. NASA ARC EMD must verify that restoration activities have been initiated prior to construction activities.
5. Recommended native plant species include but are not limited to meadow barley, purple needlegrass, coast range melic, California poppy, California brome, Molate red fescue, monkey flower, purshings lotus, deerweed, Farewell to Spring, sky lupine, and small fescue.
6. Native seed dispersal within selected restoration areas should be scheduled for the beginning of the winter rainy season. If seed dispersal occurs during the dry months, irrigation shall be necessary.
7. All restoration areas must be maintained and monitored for up to 2 years to ensure the long-term success of the restoration (i.e., restoration areas provide suitable habitat for burrowing owl). The approved qualified biologist must conduct inspections (at a frequency agreed upon by the NASA ARC EMD) and coordinate maintenance requirements with the Project Proponent or its contractor(s). If restoration and/or ground squirrel repopulation efforts are not successful, the Project Proponent or its contractor(s) shall coordinate with the NASA ARC EMD to evaluate and implement additional activities (including potential ground squirrel relocation) to ensure the continued success of the restoration.

Mitigation Measure BIO-12. Nesting Birds

Timing Restrictions. To the maximum extent feasible, as determined by the contractor in coordination with a qualified biologist, construction activities, vegetation removal, and trimming shall be scheduled during the nonbreeding season of birds (September 1 through January 31) to avoid impacts on nesting birds if nesting birds are present. If construction activities, vegetation removal, and trimming cannot be conducted in accordance with this timeframe, surveys for nesting birds and additional protective measures shall be implemented as described below.

Preconstruction Surveys. A qualified wildlife biologist with knowledge of avian species and their behavior shall conduct nesting surveys before the start of each construction phase from locations where access is allowed. A minimum of three separate surveys shall be conducted within 30 days prior to construction of each phase, with the last two surveys conducted within 7 days and 3 days prior to construction. Surveys shall be conducted within the project construction and staging areas as well as all suitable nesting habitat (e.g., trees, shrubs, potential emergent wetland, grasslands, ruderal areas, cultivated lands, human-made structures) within 500 feet of the project construction and staging areas for the current construction phase to locate any active nest protected by the MBTA or by CDFW. If no active nests are detected during these surveys, no additional measures shall be required if construction begins within 3 calendar days. An additional survey shall be conducted after any construction breaks of 3 calendar days or more.

Non-Disturbance Buffer. If active nests are found in the survey area, non-disturbance buffers shall be established around the nest sites to avoid disturbance or destruction of the nest site until the end of the breeding season (September 1) or until a qualified wildlife biologist determines that the young have fledged and moved out of the work area (this date varies by species). Buffer distances vary by species and conservation status (e.g., listed species and fully protected species, for which take is prohibited, may warrant larger buffers than non-special-status species), but typically, these buffer distances are between 300 and 650 feet for

raptors and between 50 and 250 feet for other nesting birds. The extent of the buffers shall be determined by the qualified wildlife biologist(s) and established by taking into consideration the type and extent of the proposed activity occurring near the nest, the duration and timing of the activity, the line of sight between the nest and the disturbance, the sensitivity and the habituation of the birds and raptors to existing conditions, and the dissimilarity of the proposed activity to ambient levels of noise and other disturbances. The qualified wildlife biologist(s) shall mark the extent and locations of non-disturbance buffers on maps that shall be presented to construction personnel at morning tailboards or use flagging, fencing, or other suitable physical markers, depending on the species of birds, the size of the buffers, and the construction activities to be conducted in the work area.

Nest Monitoring. The qualified wildlife biologist(s) shall monitor the nests to ensure that construction activities shall not affect nest success. Buffers (described above) may be reduced if a full-time qualified biologist is present to monitor the nest. Active nests shall be monitored to track progress of nesting activities until the biologist determines that the young have fledged and are capable of independent survival or the nest site is no longer active. Monitoring will be conducted from locations where access is allowed.

Authority of Qualified Wildlife Biologist(s). If, during construction, the qualified wildlife biologist(s) determines that a nesting bird is disturbed by construction activities to the point where continued activities could lead to nest failure, the qualified wildlife biologist(s) shall have the authority to immediately stop work and provide additional protective measures (including increasing the non-disturbance buffer distance) that need to be implemented and continue monitoring the nest until determining that bird behavior has normalized.

Mitigation Measure BIO-13. Roosting Bats

To avoid take of roosting bats, a preconstruction survey of buildings to be demolished or trees to be trimmed or removed shall be conducted in areas affected by the current construction phase by a qualified wildlife biologist in accordance with *Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions*.[11] If special-status roosting bats are found, an avoidance or mitigation plan prepared by a qualified wildlife biologist shall be developed and implemented to avoid take of roosting bats. Avoidance measures may include conducting construction, demolition, tree trimming, or tree removal outside of the hibernation (January–February) and maternal roosting (March 1–August 31) time periods and excluding bats from buildings after they have left the roost to forage at night by closing entrances. Mitigation may include the construction of bat boxes to accommodate displaced bats. If bat boxes are used, their success shall be monitored and reported to the NASA ARC EMD.

Significance after Mitigation

Alkali Milk-Vetch and Congdon's Tarplant

The impacts on alkali milk-vetch and Congdon's tarplant from the CEQA Proposed Project would be less than significant with implementation of Mitigation Measures BIO-1, BIO-2, BIO-3, and BIO-4 by providing environmental awareness training to construction personnel, conducting surveys to identify

[11] Johnston, D. S., K. Briones, and C. Pincetich. 2019. California Bat Mitigation: A Guide to Developing Feasible and Effective Solutions. H. T. Harvey & Associates, Los Gatos, CA. Prepared for the California Department of Transportation, Office of Biological Studies, Sacramento, CA. Task Order 7, Agreement 43A0355.

populations of alkali milk-vetch and Congdon's tarplant, requiring avoidance measures if alkali milk-vetch and/or Congdon's tarplant are present during construction, and compensating for impacts on individuals with seed collection and redistribution.

Monarch Butterfly and Crotch's Bumble Bee

Impacts on monarch butterfly from the CEQA Proposed Project would be less than significant with implementation of Mitigation Measures BIO-1, BIO-5, and BIO-7, which require providing environmental awareness training to construction personnel, conducting surveys to identify native milkweed patches, compensating for impacts on breeding habitat with milkweed plants, and avoiding and minimizing potential effects of herbicide and pesticide use on monarch butterfly and its larval host and nectar plants. Impacts on Crotch's bumble bee from the CEQA Proposed Project would be less than significant with the implementation of Mitigation Measures BIO-1, BIO-6, and BIO-7 by providing environmental awareness training to construction personnel, requiring preconstruction surveys for bumble bees and avoidance measures if bumble bees are present during construction activities, and avoiding and minimizing potential effects of herbicide and pesticide use on Crotch's bumble bee and its nectar plants.

Northwestern Pond Turtle

Impacts on northwestern pond turtle from the CEQA Proposed Project would be less than significant with the implementation of Mitigation Measures BIO-1 and BIO-3, which require providing environmental awareness training to construction personnel, including information regarding the stop-work authority of the qualified biologist if a special-status species is observed in work areas, and installing exclusion fencing under the guidance of the qualified biologist to prevent northwestern pond turtle from entering work areas.

Burrowing Owl

Impacts on burrowing owl from the CEQA Proposed Project would be less than significant with the implementation of Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11, which require providing environmental awareness training to construction personnel; replacing lost habitat and reducing direct effects on the species, including habitat, noise, and visual disturbances; and implementing protective measures during maintenance and species-specific avoidance measures during construction. Existing NASA Ames Burrowing Owl Management Plan measures would continue to be implemented to reduce operational impacts on burrowing owl; therefore operational impacts would be less than significant.

Other Special-Status Birds

Impacts on other special-status nesting birds from the CEQA Proposed Project would be less than significant with the implementation of Mitigation Measures BIO-1 and BIO-12, which require environmental awareness training for construction personnel, preconstruction surveys during the breeding season, and avoidance measures if nesting birds are present during construction. Impacts on other special-status foraging birds from the CEQA Proposed Project would be less than significant with the implementation Mitigation Measures BIO-1 and BIO-3 by providing environmental awareness training to construction personnel, including information regarding the stop-work authority of the qualified biologist if a special-status species is observed in work areas, and installing exclusion fencing between the work area and the palustrine emergent wetland under the guidance of the qualified biologist to prevent Ridgway's rail from entering work areas.

Special-Status Bats

Impacts on special-status bats from the CEQA Proposed Project would be less than significant with the implementation of Mitigation Measures BIO-1 and BIO-13, which require providing environmental awareness training to construction personnel, conducting preconstruction surveys, and implementing avoidance measures if special-status bats are present.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-2. Preconstruction Surveys for Special-Status Species

Mitigation Measure BIO-3. Exclusion Fencing

Mitigation Measure BIO-4. Alkali Milk-Vetch and Congdon's Tarplant

Mitigation Measure BIO-5. Monarch Butterfly Breeding Habitat

Mitigation Measure BIO-6. Crotch's Bumble Bee

Mitigation Measure BIO-7. Herbicide and Pesticide Use

Mitigation Measure BIO-8. Burrowing Owl Surveys

Mitigation Measure BIO-9. Burrowing Owl Avoidance

Mitigation Measure BIO-10. Burrowing Owl Relocation

Mitigation Measure BIO-11. Burrowing Owl Habitat

Mitigation Measure BIO-12. Nesting Birds

Mitigation Measure BIO-13. Roosting Bats

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measure BIO-1 through BIO-13 would reduce impacts to less than significant. Mitigation Measures BIO-1, BIO-2, BIO-3 and BIO-4 are identified to minimize potential impacts on alkali milk-vetch and Congdon's tarplant by providing environmental awareness training

to construction personnel, requiring pre-constructions surveys, implementing avoidance measures, and compensating for direct impacts on plants if avoidance is not feasible. Mitigation Measures BIO-1, BIO-5, and BIO-7 are identified to minimize potential impacts on monarch butterflies by providing environmental awareness training to construction personnel, requiring surveys to identify native milkweed patches, compensating for impacts on breeding habitat with milkweed plants, and avoiding and minimizing potential effects of herbicide and pesticide use on monarch butterfly and its larval host and nectar plants. Mitigation Measures BIO-1, BIO-6, and BIO-7 are identified to minimize potential impacts on Crotch's bumble bee by providing environmental awareness training to construction personnel, requiring preconstruction surveys for bumble bees, implementing avoidance measures if bumble bees are present during construction, and avoiding and minimizing potential effects of herbicide and pesticide use on Crotch's bumble bee and its nectar plants. Mitigation Measures BIO-1, BIO-2, and BIO-3 are identified to minimize potential impacts on northwestern pond turtle by providing environmental awareness training to construction personnel, including information regarding the stop-work authority of the qualified biologist if a special-status species is observed in work areas; requiring preconstruction surveys for northwestern pond turtle; and installing exclusion fencing under the guidance of the qualified biologist to prevent northwestern pond turtle from entering work areas. Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are identified to minimize potential impacts on burrowing owl by providing environmental awareness training to construction personnel, requiring preconstruction surveys for burrowing owls, implementing avoidance measures if burrowing owls are present during construction activities, and requiring compensation for loss of burrowing owl habitat. Furthermore, NASA Ames Burrowing Owl Management Plan measures would continue to be implemented to reduce operational impacts on burrowing owl. Mitigation Measures BIO-1 and BIO-10 are identified to minimize potential impacts on other special-status nesting birds by providing environmental awareness training to construction personnel, requiring preconstruction surveys during the breeding season, and implementing avoidance measures if nesting birds are present during construction. Mitigation Measures BIO-1 and BIO-12 are identified to minimize potential impacts on other special-status foraging birds by providing environmental awareness training to construction personnel, including information regarding the stop-work authority of the qualified biologist if a special-status species is observed in work areas, and installing exclusion fencing between the work area and the potential emergent wetland under the guidance of the qualified biologist to prevent Ridgway's rail from entering work areas. Mitigation Measures BIO-1 and BIO-13 are identified to minimize potential impacts on special-status bats by providing environmental awareness to construction personnel, requiring preconstruction surveys, and implementing avoidance measures if roosting bats are present. As a result, effects related to directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. Construction activities under the CEQA Reduced Density Alternative, including the area of ground-disturbing activities and depth of excavation, would be the same as under the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-2. Preconstruction Surveys for Special-Status Species

Mitigation Measure BIO-3. Exclusion Fencing

Mitigation Measure BIO-4. Alkali Milk-Vetch and Congdon's Tarplant

Mitigation Measure BIO-5. Monarch Butterfly Breeding Habitat

Mitigation Measure BIO-6. Crotch's Bumble Bee

Mitigation Measure BIO-7. Herbicide and Pesticide Use

Mitigation Measure BIO-8. Burrowing Owl Surveys

Mitigation Measure BIO-9. Burrowing Owl Avoidance

Mitigation Measure BIO-10. Burrowing Owl Relocation

Mitigation Measure BIO-11. Burrowing Owl Habitat

Mitigation Measure BIO-12. Nesting Birds

Mitigation Measure BIO-13. Roosting Bats

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measure BIO-1 through BIO-13 would reduce impacts to less than significant. Mitigation Measures BIO-1, BIO-5, and BIO-7 are identified to minimize potential impacts on monarch butterflies by providing environmental awareness training to construction personnel, requiring surveys to identify native milkweed patches, compensating for impacts on breeding habitat with milkweed plants, and avoiding and minimizing potential effects of herbicide and pesticide use on monarch butterfly and its larval host and nectar plants. Impact CEQA-BIO-2: Would the project have a substantial adverse effect on any riparian habitat or sensitive natural community identified in local or regional plans, policies, or regulations or by CDFW or USFWS?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	BIO-1. Environmental Resources Worker Awareness Training BIO-3. Exclusion Fencing	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

As described in Appendix 3.4-1, construction under the CEQA Proposed Project could result in significant impacts on perennial grassland, a sensitive natural community, through the temporary effects of sidecasting. Therefore, impacts on a sensitive natural community would be potentially significant before mitigation. Effects on emergent wetland communities are discussed under Impact CEQA-BIO-3.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-3. Exclusion Fencing

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measure BIO-1 and BIO-3 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1 and BIO-3 would minimize potential impacts on a sensitive natural community by requiring training for construction personnel regarding vegetation protection, reporting, and ramifications for not following the measures; they would also require exclusion fencing to be installed under the guidance of a qualified biologist to protect vegetation from sidecastings or other indirect impacts. As a result, impacts related to a sensitive natural community would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-3. Exclusion Fencing

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measure BIO-1 and BIO-3 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1 and BIO-3 would minimize potential impacts on a sensitive natural community by requiring training for construction personnel regarding vegetation protection, reporting, and ramifications for not following the measures; they would also require exclusion fencing to be installed under the guidance of a qualified biologist to protect vegetation from sidecastings or other indirect impacts. As a result, impacts related to a sensitive natural community would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. Construction activities under the CEQA Reduced Density Alternative, including the area of ground-disturbing activities and depth of excavation, would be the same as under the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

As described in Appendix 3.4-1, the project is designed to not exceed operational existing conditions of the stormwater outfall within a 10-year storm event. Additionally, the outfall and connection to the off-site trunk main would incorporate an orifice and a weir to allow excess water to leave the system when the storage pipes are full for storms greater than a 10-year storm event. Construction under the CEQA Proposed Project could result in significant impacts on State or federally protected wetlands through the temporary effects of sidecasting and pollution during construction. During construction, sidecasting of excavated material could encroach on the wetland resource. Therefore, impacts on a wetland would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-3. Exclusion Fencing

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Mitigation Measure BIO-14. Avoid and Minimize Disturbance of Waters of the United States, including Wetlands, and Waters of the State

To the extent possible, the project shall avoid and minimize impacts on waters of the United States, including wetlands, and waters of the State by implementing the measures below.

- The project shall be designed, to the extent possible, to avoid and minimize direct and indirect impacts on waters of the United States, including wetlands, and waters of the State.
- Construction activities shall be avoided in saturated or ponded natural wetlands during the wet season (October through May)) to the maximum extent possible. Where such activities are unavoidable, protective practices, such as the use of padding or vehicles with balloon tires, shall be employed.
- All activities shall be completed promptly to minimize their duration and resultant impacts.

Mitigation Measure BIO-15. Compensate for Losses of Waters of the United States, including Wetlands, and Waters of the State

If it is not feasible for construction activities to avoid impacts on waters of the United States, including wetlands, or waters of the State, the following shall apply:

- The Project Proponent or its contractor(s) shall acquire all applicable permits.
- The Project Proponent or its contractor(s) shall demonstrate that there would be no net loss of wetlands and other waters of the United States or State-protected waters/wetlands from project construction. To ensure this, wetland mitigation shall be developed as a part of the permitting process. Mitigation shall be provided before construction-related impacts on the existing wetlands occur. Mitigation typically includes the purchase of mitigation credits within the watershed. The exact mitigation requirement and ratio will be determined in consultation with USACE and/or RWQCB, but the Project Proponent or its contractor(s) shall compensate for affected wetlands at a ratio of no less than 1:1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-3, BIO-14, and BIO-15 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1 and BIO-3 would minimize potential impacts on a sensitive natural community by requiring training for construction personnel regarding vegetation protection, reporting, and ramifications for not following the measures; they would also require exclusion fencing to be installed under the guidance of a qualified biologist to protect vegetation from sidecastings or other indirect impacts. Mitigation Measure BIO-14 would require the project to avoid and minimize wetlands to the extent possible, and Mitigation Measure BIO-15 would require the Project Proponent to compensate for any losses of wetlands. As a result, impacts related to wetlands would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-3. Exclusion Fencing

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Mitigation Measure BIO-14. Avoid and Minimize Disturbance of Waters of the United States, including Wetlands, and Waters of the State

Mitigation Measure BIO-15. Compensate for Losses of Waters of the United States, including Wetlands, and Waters of the State

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-3.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-3, BIO-14, and BIO-15 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1 and BIO-3 would minimize potential impacts on a sensitive natural community by requiring training for construction personnel regarding vegetation protection, reporting, and ramifications for not following the measures; they would also require exclusion fencing to be installed under the guidance of a qualified biologist to protect vegetation from sidecastings or other indirect impacts. Mitigation Measure BIO-14 would require the project to avoid and minimize wetlands to the extent possible, and Mitigation Measure BIO-15 would require the Project Proponent to compensate for any losses of wetlands. As a result, impacts related to wetlands would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. Construction activities under the CEQA Reduced Density Alternative, including the area of ground-disturbing activities and depth of excavation, would be the same as under the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-3. Exclusion Fencing

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Mitigation Measure BIO-14. Avoid and Minimize Disturbance of Waters of the United States, including Wetlands, and Waters of the State

Mitigation Measure BIO-15. Compensate for Losses of Waters of the United States, including Wetlands, and Waters of the State

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-3.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-3, BIO-14, and BIO-15 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1 and BIO-3 would minimize potential impacts on a sensitive natural community by requiring training for construction personnel regarding vegetation protection, reporting, and ramifications for not following the measures; they would also require exclusion fencing to be installed under the guidance of a qualified biologist to protect vegetation from sidecastings or other indirect impacts. Mitigation Measure BIO-14 would require the project to avoid and minimize wetlands to the extent possible, and Mitigation Measure BIO-15 would require the Project Proponent to compensate for any losses of wetlands. As a result, impacts related to wetlands would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-3. Exclusion Fencing

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Mitigation Measure BIO-14. Avoid and Minimize Disturbance of Waters of the United States, including Wetlands, and Waters of the State

Mitigation Measure BIO-15. Compensate for Losses of Waters of the United States, including Wetlands, and Waters of the State

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-3.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-3, BIO-14, and BIO-15 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1 and BIO-3 would minimize potential

impacts on a sensitive natural community by requiring training for construction personnel regarding vegetation protection, reporting, and ramifications for not following the measures; they would also require exclusion fencing to be installed under the guidance of a qualified biologist to protect vegetation from sidecastings or other indirect impacts. Mitigation Measure BIO-14 would require the project to avoid and minimize wetlands to the extent possible, and Mitigation Measure BIO-15 would require the Project Proponent to compensate for any losses of wetlands. As a result, impacts related to wetlands would be less than significant with mitigation.

Impact CEQA-BIO-4: Would the project interfere with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	BIO-1. Environmental Resources Worker Awareness Training BIO-12. Nesting Birds BIO-13. Roosting Bats	Less than Significant with Mitigation
CEQA Proposed Project No Student/Faculty Housing Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Impacts on Terrestrial Wildlife Movement

As described in Appendix 3.4-1, construction, operations, and maintenance under the CEQA Proposed Project would have a less-than-significant impact on terrestrial wildlife movement.

Impacts on Non-Special-Status Nesting Birds

As described in Appendix 3.4-1, construction under the CEQA Proposed Project would result in potentially significant impacts on non-special-status nesting birds before mitigation because of the potential for injury and mortality and the disruption of normal behaviors during nesting season.

Impacts on Roosting Bats

As described in Appendix 3.4-1, construction under the CEQA Proposed Project would result in potentially significant impacts on non-special-status roosting bats before mitigation because of the potential for injury and mortality and the disruption of normal behaviors.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-12. Nesting Birds

Mitigation Measure BIO-13. Roosting Bats

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-12, and BIO-13 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-12, and BIO-13 require environmental awareness training for construction personnel, preconstruction surveys during the breeding season, avoidance measures if nesting birds are present during construction, and avoidance measures if roosting bats are present, which would avoid injury or mortality of non-special-status nesting birds and roosting bats. As a result, impacts on the use of native wildlife nursery sites would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-12. Nesting Birds

Mitigation Measure BIO-13. Roosting Bats

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-12, and BIO-13 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-12, and BIO-13 require environmental awareness training for construction personnel, preconstruction surveys during the breeding season, avoidance measures if nesting birds are present during construction, and avoidance measures if roosting bats are present, which would avoid injury or mortality of non-special-status nesting birds

and roosting bats. As a result, impacts on non-special-status nesting birds and roosting bats would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. Construction activities under the CEQA Reduced Density Alternative, including the area of ground-disturbing activities and depth of excavation, would be the same as under the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-12. Nesting Birds

Mitigation Measure BIO-13. Roosting Bats

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-12, and BIO-13 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-12, and BIO-13 require environmental awareness training for construction personnel, preconstruction surveys during the breeding season, avoidance measures if nesting birds are present during construction, and avoidance measures if roosting bats are present, which would avoid injury or mortality of non-special-status nesting birds and roosting bats. As a result, impacts on the use of native wildlife nursery sites would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-12. Nesting Birds

Mitigation Measure BIO-13. Roosting Bats

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-12, and BIO-13 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-12, and BIO-13 require environmental awareness training for construction personnel, preconstruction surveys during the breeding season, avoidance measures if nesting birds are present during construction, and avoidance measures if roosting bats are present, which would avoid injury or mortality of non-special-status nesting birds and roosting bats. As a result, impacts on the use of native wildlife nursery sites would be less than significant with mitigation.

Impact CEQA-BIO-5: Would the project conflict with the provisions of an applicable adopted HCP, NCCP, or other approved local, regional, or State HCP?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	BIO-1. Environmental Resources Worker Awareness Training BIO-8. Burrowing Owl Surveys BIO-9. Burrowing Owl Avoidance BIO-10. Burrowing Owl Relocation BIO-11. Burrowing Owl Habitat	Less than Significant with Mitigation
CEQA Proposed Project No Student/Faculty Housing Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

The Biological Resources Study Area is within the area covered by the PG&E Bay Area Operations and Maintenance Habitat Conservation Plan. The CEQA Proposed Project would not interfere with or affect any covered activities or conservation actions associated with operation and maintenance of

PG&E utility infrastructure. Therefore, the CEQA Proposed Project would not conflict with the provisions of this plan.

As described in Appendix 3.4-1, construction, operations, and maintenance under the CEQA Proposed Project could conflict with the provisions of the Santa Clara Valley HCP/NCCP. Although the Project Proponent is not a permittee under the Santa Clara Valley HCP/NCCP, the CEQA Proposed Project would not interfere with or affect any of the plan's covered activities. There are known burrowing owl colonies adjacent to the Project Site at Moffett Federal Airfield, an area where nesting and foraging habitat for this species is managed by NASA; the species is included in the Santa Clara Valley HCP/NCCP. In addition, the northern extent of the Biological Resources Study Area overlaps a burrowing owl preserve. No other covered activities or conservation actions under the Santa Clara Valley HCP/NCCP occur within this area. Construction-related noise and vibration could conflict with conservation and management actions for burrowing owl under the HCP/NCCP and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-8. Burrowing Owl Surveys

Mitigation Measure BIO-9. Burrowing Owl Avoidance

Mitigation Measure BIO-10. Burrowing Owl Relocation

Mitigation Measure BIO-11. Burrowing Owl Habitat

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10 and BIO-11 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are identified to minimize potential impacts on burrowing owl and burrowing owl–specific conservation actions of the Santa Clara Valley HCP/NCCP by providing environmental awareness training for construction personnel, requiring preconstruction surveys for burrowing owls, implemenitng avoidance measures if burrowing owls are present during construction, and requiring compensation for the loss of burrowing owl habitat. Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are consistent with both the NASA Ames Research Center Burrowing Owl Habitat Management Plan[12] and the Santa Clara Valley HCP/NCCP Burrowing Owl Conservation Strategy.[13] As a result, impacts related to conflicts with an applicable adopted HCP, NCCP, or other approved local, regional, or State HCP would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-8. Burrowing Owl Surveys

Mitigation Measure BIO-9. Burrowing Owl Avoidance

Mitigation Measure BIO-10. Burrowing Owl Relocation

Mitigation Measure BIO-11. Burrowing Owl Habitat

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are identified to minimize potential impacts on burrowing owl and burrowing owl–specific conservation actions of the Santa Clara Valley HCP/NCCP by providing environmental awareness training for construction personnel, requiring preconstruction surveys for burrowing owls, implemenitng avoidance measures if burrowing owls are present during construction, and requiring compensation for the loss of burrowing owl habitat. Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are consistent with both the NASA Ames Research Center Burrowing Owl Habitat Management Plan[14] and the Santa Clara Valley HCP/NCCP Burrowing Owl Conservation Strategy.[15] As a result, impacts related to conflicts with an applicable adopted HCP, NCCP, or other approved local, regional, or State HCP would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. Construction activities under the CEQA Reduced Density Alternative, including the area of ground-disturbing activities and depth of excavation, would be the same as under the CEQA Proposed Project. The potential for the types of

14 Leidos. 2022. *NASA Ames Research Center Moffett Field Burrowing Owl Habitat Management Plan.*

15 Santa Clara Valley Habitat Agency. 2012. *Final Santa Clara Valley Habitat Plan*.

impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

Mitigation Measure BIO-8. Burrowing Owl Surveys

Mitigation Measure BIO-9. Burrowing Owl Avoidance

Mitigation Measure BIO-10. Burrowing Owl Relocation

Mitigation Measure BIO-11. Burrowing Owl Habitat

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are identified to minimize potential impacts on burrowing owl and burrowing owl–specific conservation actions of the Santa Clara Valley HCP/NCCP by providing environmental awareness training for construction personnel, requiring preconstruction surveys for burrowing owls, implemenitng avoidance measures if burrowing owls are present during construction, and requiring compensation for the loss of burrowing owl habitat. Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are consistent with both the NASA Ames Research Center Burrowing Owl Habitat Management Plan[16] and the Santa Clara Valley HCP/NCCP Burrowing Owl Conservation Strategy.[17] As a result, impacts related to conflicts with an applicable adopted HCP, NCCP, or other approved local, regional, or State HCP would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure BIO-1. Environmental Resources Worker Awareness Training

16 Leidos. 2022. *NASA Ames Research Center Moffett Field Burrowing Owl Habitat Management Plan.*

17 Santa Clara Valley Habitat Agency. 2012. *Final Santa Clara Valley Habitat Plan*.

Mitigation Measure BIO-8. Burrowing Owl Surveys

Mitigation Measure BIO-9. Burrowing Owl Avoidance

Mitigation Measure BIO-10. Burrowing Owl Relocation

Mitigation Measure BIO-11. Burrowing Owl Habitat

See discussion for the CEQA Proposed Project under Impact CEQA-BIO-1.

Significance after Mitigation

Implementation of Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 would reduce impacts to less than significant. Specifically, Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are identified to minimize potential impacts on burrowing owl and burrowing owl–specific conservation actions of the Santa Clara Valley HCP/NCCP by providing environmental awareness training for construction personnel, requiring preconstruction surveys for burrowing owls, implemenitng avoidance measures if burrowing owls are present during construction, and requiring compensation for the loss of burrowing owl habitat. Mitigation Measures BIO-1, BIO-8, BIO-9, BIO-10, and BIO-11 are consistent with both the NASA Ames Research Center Burrowing Owl Habitat Management Plan[18] and the Santa Clara Valley HCP/NCCP Burrowing Owl Conservation Strategy.[19] As a result, impacts related to conflicts with an applicable adopted HCP, NCCP, or other approved local, regional, or State HCP would be less than significant with mitigation.

3.4.9 Cumulative Impacts

Cumulative impacts are addressed only for those thresholds that would result in a project-related impact. If the proposed project would result in no impact with respect to a particular threshold, it would not contribute to a cumulative impact. As discussed in Section 3.4.7, *Impacts Not Evaluated in Detail*, the proposed project would result in no impact related to conflicts with local policies or ordinances protecting biological resources, and no cumulative analysis is required. The discussion of cumulative impacts addresses the topics evaluated in the corresponding project impacts in Section 3.4.8, *Impacts and Mitigation Measures*, above.

The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Impact Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. The cumulative geographic context for biological resources considers the degree to which significant vegetation and wildlife resources would be protected within the Limits of Work. It also considers NASA ARC, Mountain View, and Sunnyvale. This is considered appropriate because of the highly urbanized nature of the region surrounding the Limits of Work.

Impact CEQA-C-BIO-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to biological resources? (Less than Cumulatively Considerable with Mitigation)

Cumulative projects would result in habitat loss, injury and mortality, and the disruption of normal behaviors of special-status species. Cumulative projects could contribute to an incremental

[18] Leidos. 2022. *NASA Ames Research Center Moffett Field Burrowing Owl Habitat Management Plan.*

[19] Santa Clara Valley Habitat Agency. 2012. *Final Santa Clara Valley Habitat Plan*.

reduction in the amount of wildlife habitat, particularly for birds and larger mammals. Cumulative projects in NASA ARC and the region could result in further conversion of natural habitats to urban and suburban conditions, thereby limiting the existing habitat values of the surrounding area. The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) in combination with other projects in the area, as well as other activities that would affect the species that would be affected by the proposed project, could contribute to cumulative effects on special-status species. Cumulative projects in NASA ARC include various types of land uses that could adversely affect these species. As discussed in Impacts CEQA-BIO-1 through CEQA-BIO-6, the CEQA Proposed Project and CEQA Reduced Density Alternative would result in potentially significant impacts on biological resources. Therefore, the impacts of the cumulative projects, combined with the proposed project, would result in a significant cumulative impact related to biological resources.

Implementation of Mitigation Measure BIO-1 through Mitigation Measure BIO-15 would avoid or minimize the effects of construction, operations, and maintenance on biological resources and provide offsetting compensation for permanent and, in some cases, temporary losses of habitat. The mitigation measures identified in this section would reduce the potential significant cumulative effects from the combined habitat losses and conversions due to project construction as well as operations and maintenance. Therefore, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would not result in a cumulatively considerable contribution to significant environmental impacts on biological resources.

3.5 Cultural Resources

3.5.1 Introduction

This section evaluates the potential impacts on cultural resources that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Limits of Work as well as the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical study prepared for the project.

- *Cultural Resource Inventory Report for the Berkeley Space Center at NASA Research Park Project* (Cultural Resource Inventory Report) prepared by Albion and Architectural Resources Group, April 2026 (Appendix 3.5-1 of this joint environmental impact report/environmental impact statement [EIR/EIS])

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. The NOP/NOI comments pertaining to cultural resources include guidance from the National Trust for Historic Preservation to follow the Section 106 review process outlined in the National Historic Preservation Act (NHPA). Furthermore, the National Trust for Historic Preservation recommended that the National Environmental Policy Act (NEPA) process should consider potential impacts on historic properties, including cumulative impacts. The National Trust for Historic Preservation described that resources of concern could include archaeological resources and resources of significance to tribes and indigenous people. These issues are addressed under Impacts CEQA-CUL-1 and CEQA-CUL-2.

3.5.2 Affected Environment/Environmental Setting

Cultural resources refer to any tangible evidence of past human activity, regardless of significance, found in association with a geographic location. Cultural resources include tangible properties possessing intangible cultural values. Cultural resources included in or eligible for listing in the National Register of Historical Places (NRHP) qualify as historic properties for the purposes of NEPA and Section 106 review. Cultural resources included in or eligible for listing in the California Register of Historical Resources (CRHR), as well as those identified as significant in qualifying local historical surveys and resource inventories or determined by the lead agency based on substantial evidence, qualify as historical resources for the purposes of CEQA review. Five classes of cultural resources are generally recognized: buildings, structures, objects, sites, and districts. These classes encompass a range of resource types including precontact archaeological sites, historic archaeological sites, built-environment elements, cultural landscapes, and ethnographic resources, including Traditional Cultural Places and Tribal Cultural Resources (TCRs), as discussed in Section 3.17, *Tribal Cultural Resources*, of this joint EIR/EIS. Human remains are also addressed in this section. A detailed discussion of Native American consultation methodology is provided in Section 3.17, *Tribal Cultural Resources*.

Detailed information on the background of the Project Site related to cultural resources—including its environmental context, precontact historical context, ethnographic context, and post-contact

historical context—is available in Chapter 5 of the Cultural Resource Inventory Report (Appendix 3.5-1 of this joint EIR/EIS).

3.5.2.1 Resource Identification Methodology

Area of Potential Effects

For the purposes of NEPA and CEQA analysis, project impacts on significant cultural resources are analyzed within a defined geographic area. The NHPA, which informs the NEPA process, uses the term Area of Potential Effects (APE) to refer to the geographic area in which a given undertaking may result in changes to the characteristics or uses of historic properties. (36 Code of Federal Regulations [CFR] Section 800.16(d).) Although CEQA and the CEQA Guidelines do not specifically reference the concept of an APE, the delineation of a geographic area in which potential impacts may occur is a similarly important step in assessing historical resource impacts under CEQA. Therefore, an APE may inform the cultural resource analysis required by the NHPA, NEPA, and CEQA.

Figure 3.5-1, APE and ADI Map with Depths of Impact, shows the APE for the proposed project. The APE includes all areas that may be directly or indirectly affected by the project resulting in changes to the character or use of historic properties. The APE was determined through review of project plans, review of maximum building heights, estimation of maximum potential for ground disturbance, identification of the locations of previously recorded cultural resources (e.g., built-environment resources, archaeological sites), and consideration of the geographic area within which the undertaking may directly or indirectly cause alterations in the character or use of historic properties. The proposed APE for the proposed project is the largest geographic extent in which the undertaking may result in effects on historic properties, and it includes horizontal and vertical considerations.

The horizontal APE is located between U.S. 101 and the southwestern edge of the San Francisco Bay, and it encompasses an area approximately 1,280 acres. The horizontal APE encompasses the following:

- **Area of Direct Impact (ADI)**: The approximately 45-acre ADI (or, Limits of Work), which contains the Project Site and the proposed off-site utility improvements and demolition areas, includes the areas likely to involve ground disturbance (e.g., the demolition of existing improvements as well as the construction of new facilities, roadways, and landscape elements). Such ground disturbance could cause physical damage to or destruction of archaeological resources.
- **Built-Environment Study Area**: It is possible for a project to have visual, atmospheric, or audible effects on significant cultural resources located outside of the Project Site (typically built-environment resources). The built-environment study area corresponds to the geographic area in which such effects are most likely to occur. This area encompasses the Project Site as well as the surrounding area in which the new construction proposed by the project may be perceived. The built-environment study area extends south and west from the Project Site to the boundaries of the NASA Ames Research Center (NASA ARC) along the U.S. 101 corridor, as well as north and east to include the open spaces of Shenandoah Plaza and the runway complex of Moffett Federal Airfield. The built-environment study area also includes buildings along the eastern edge of the airfield, which have nearly uninterrupted sightlines toward the Project Site.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

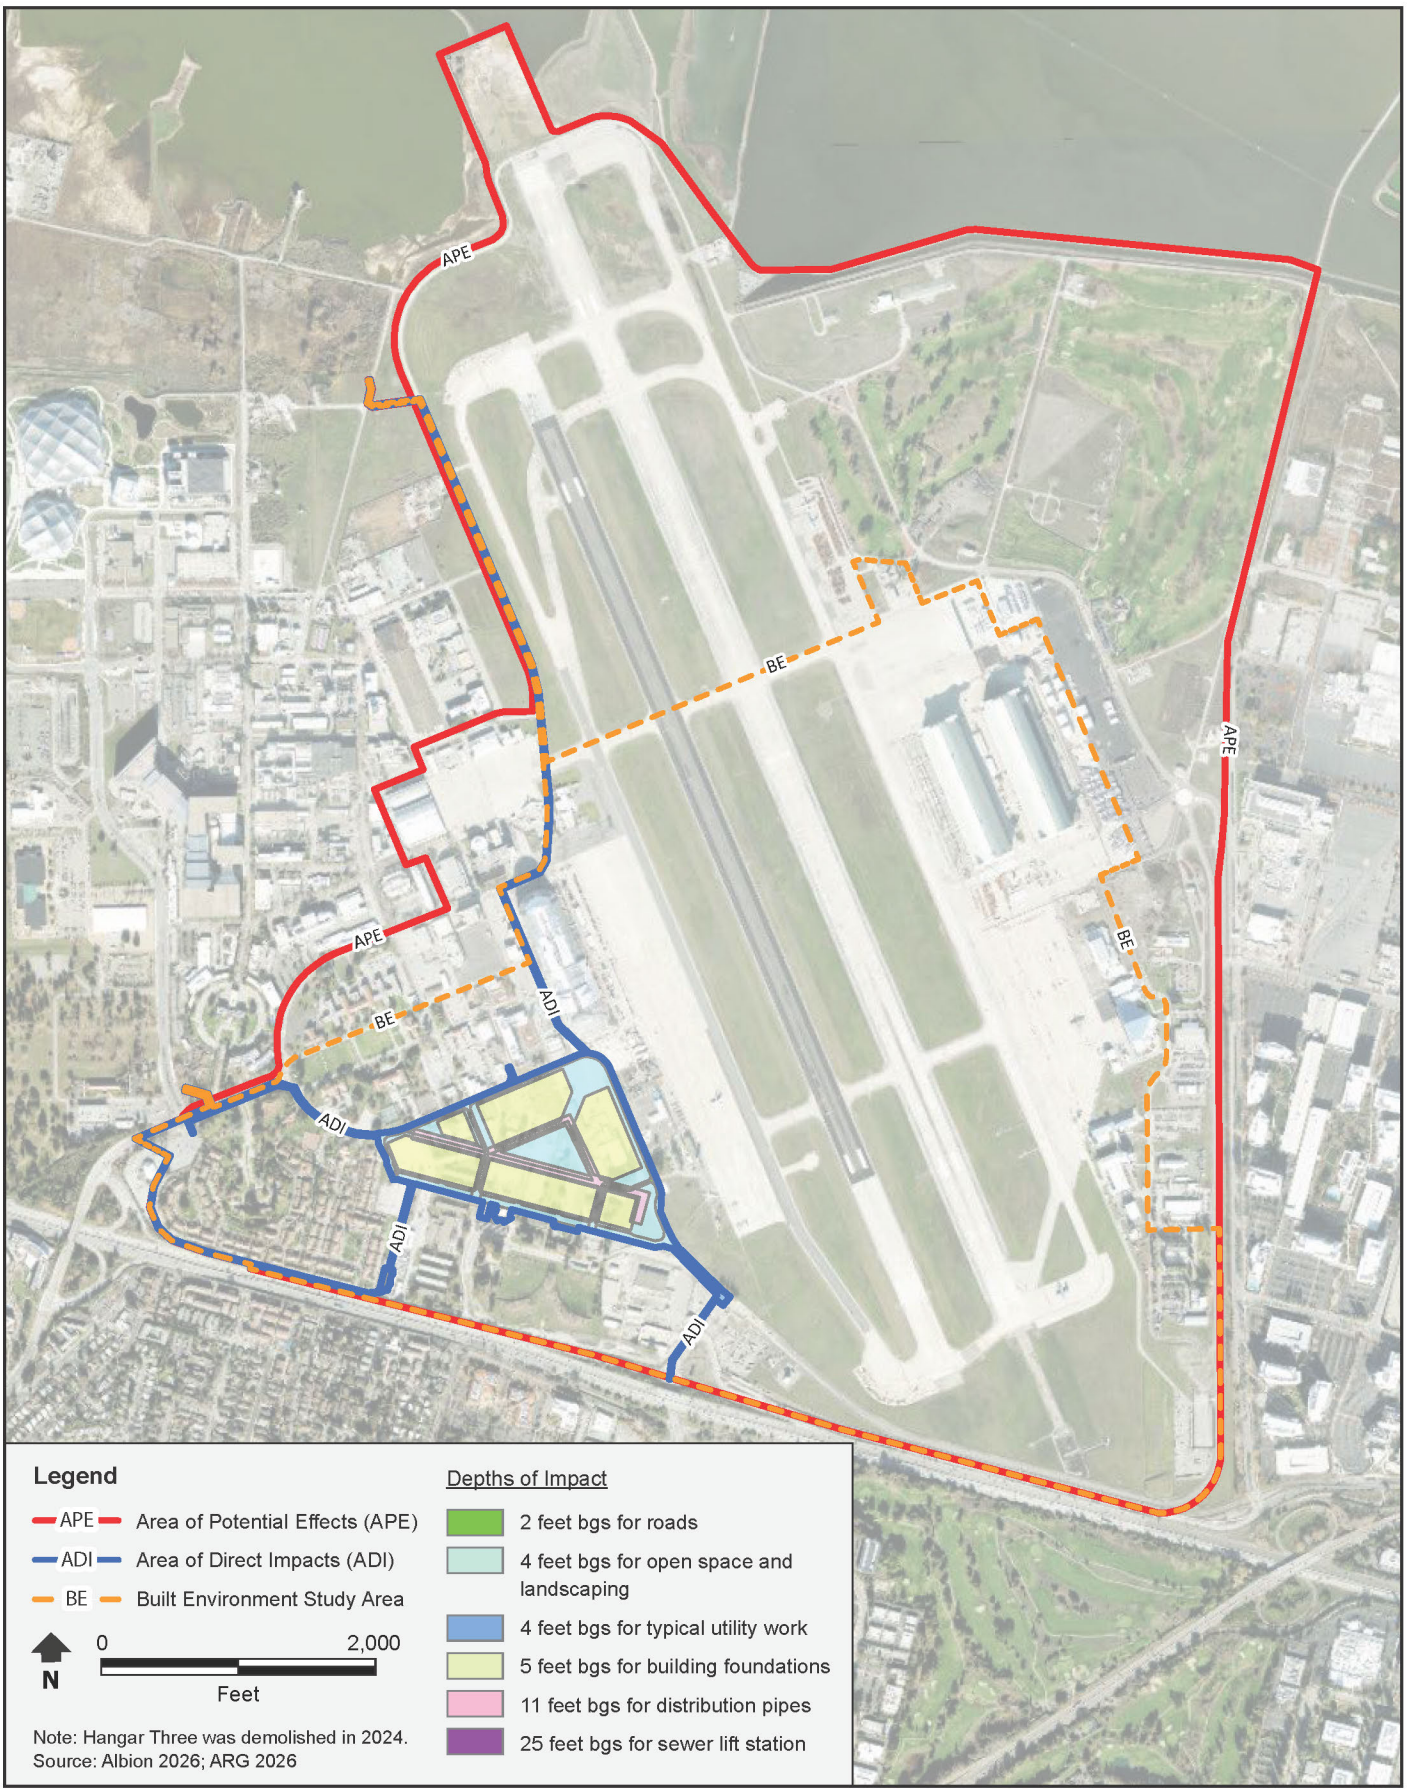

Figure 3.5-1
APE and ADI Map with Depths of Impact
Berkeley Space Center at NASA Research Park

- **U.S. Naval Air Station Sunnyvale, California Historic District (NAS Sunnyvale Historic District)**: The horizontal APE includes the entirety of the expanded NAS Sunnyvale Historic District, which is larger than the built-environment study area. The delineation of the APE in this manner recognizes the proposed project's potential to affect the visual, atmospheric, and audible conditions of the entire historic district. The vertical APE, which primarily applies to archaeological resources, is limited to the ADI and ranges between 1 and 25 feet, depending on the depth of disturbance that may be caused by different project elements.

Northwest Information Center Records Search

The identification of significant cultural resources within the APE was informed by previous investigations within and surrounding the Project Site, which were identified through records searches at the California Historical Resources Information System (CHRIS), Northwest Information Center (NWIC). Albion and ARG reviewed the results of prior records searches completed by AECOM in 2016 and 2023. In addition, Albion conducted an updated records search for the current APE in 2025.

According to the three NWIC records searches, 62 cultural resource studies have been conducted within a 0.5-mile radius of the APE. The records searches also identified 155 previously recorded cultural resources that are located in the APE. Of the 155 cultural resources located in the APE, ten are archaeological resources and 145 are built-environment resources. Forty additional cultural resources have been identified within a 0.5-mile radius of the APE. The studies and recorded resources identified in the records searches are listed in Chapter 4 of the Cultural Resource Inventory Report.

Investigators also examined additional documentation associated with several built-environment surveys and historical register designation efforts that have been undertaken in the built-environment study area, including the NRHP designation form for the NAS Sunnyvale Historic District and surveys conducted as part of the Section 106 review process for various undertakings at NASA ARC. This documentation was not included in the CHRIS records search results but was provided by NASA.

Outreach to Interested Parties

NASA, as the lead federal agency, contacted local governments, historical societies, and historic preservation organizations that were identified as having a potential interest in the project and in cultural resources that might be affected by the project. Letters sent to these interested parties included invitations to participate as consulting parties in the Section 106 review process. NASA subsequently conducted follow-up outreach to organizations that did not respond to the initial letter. Representatives of the Moffett Field Museum, City of Mountain View, Mountain View Historical Association, and Santa Clara County Historical Heritage Commission ultimately accepted the consultation invitation and attended a virtual consultation meeting on June 25, 2025. During the meeting, the University of California, Berkeley (UC Berkeley) presented details regarding the proposed project, and ARG summarized historical development of the Project Site as well as previous and current NRHP evaluation efforts at Moffett Federal Airfield. Attendees at the meeting were given the opportunity to share questions and comments regarding the proposed project, current efforts to identify historic properties, and the assessment of potential effects. Representatives of the City of Mountain View, County of Santa Clara, Moffett Field Museum, Mountain View Historical Association, and California Office of Historic Preservation attended a

second consultation meeting on January 30, 2026, during which NASA provided a summary of the Section 106 review process outlined in the NASA-wide Programmatic Agreement (NPA), and ARG summarized the results of the built-environment historic property identification and effects analysis. NASA and ARG then presented consulting parties with the draft mitigation plan and described the next steps for consulting-party input.

A communication log summarizing NASA's correspondence with the interested parties, as well as a sample outreach letter, are available in Appendix O of the Cultural Resource Inventory Report.

In addition, NASA and UC Berkeley conducted consultation with Native American representatives. Details of consultation with Native American representatives are described in Section 3.17, *Tribal Cultural Resources*.

Built-Environment Survey and Evaluation

Following the review of the NWIC records search results and additional documentation, professionally qualified architectural historians identified historic-aged built-environment resources within the built-environment study area that had not previously been evaluated for historic register eligibility through formal designation efforts or as part of the Section 106 process. "Historic-aged" refers to resources that were constructed at least 45 years prior to the date of the field survey (i.e., in 1980 or earlier). Although the NRHP typically recognizes a 50-year age threshold for potential eligibility, the current investigation employed a 45-year threshold to ensure the results would remain valid during the duration of the environmental studies and the proposed start of project construction. Furthermore, the CRHR does not include a 50-year threshold, although 45 years remains a useful benchmark to identify built-environment resources with the greatest likelihood of meeting the CRHR significance criteria.[1]

Investigators surveyed and recorded the historic-aged resources that had not previously been evaluated for historic register eligibility using California Department of Parks and Recreation (DPR) inventory forms. The inventory forms document evaluations for each resource using the NRHP and CRHR significance criteria to determine whether the resource qualifies as a historic property for Section 106 and NEPA, as a historical resource for CEQA, or both. Additionally, those previously unevaluated resources located within the identified boundary of the NAS Sunnyvale Historic District were evaluated to determine if they are contributors to the historic district.

Some properties in the built-environment study area were previously documented when they were less than 50 years old. In these instances, the resources were subject to evaluation using the "exceptional importance" threshold of NRHP Criteria Consideration G. During the current investigation, each resource that has subsequently reached historic age was surveyed and reevaluated for NRHP and CRHR eligibility without the application of Criteria Consideration G.

Furthermore, several previously evaluated built-environment resources in the study area have been demolished after their most recent documentation. As part of the current investigation, the

[1] Sherfy, M., and Luce, W.R. 1998. National Register Bulletin: Guidelines for Evaluating and Nominating Properties That Have Achieved Significance Within the Past Fifty Years, Washington, DC: Department of the Interior. Accessed August 28, 2025. Available: https://ohp.parks.ca.gov/pages/1069/files/technical%20assistance%20bulletin%206%202011%20update.pdf.

documentation for these resources was updated to substantiate that no physical elements of the resources remain extant.

The inventory forms prepared during the current investigation are compiled in Appendix Q of the Cultural Resource Inventory Report.

Archaeological Survey

On May 14, 2025, Albion Archaeologists conducted an intensive surface survey of the ADI. The survey area involved the 39-acre Project Site as well as approximately 2.4 miles of surrounding roads (see Figure 3.5-1, APE and ADI Map with Depths of Impact). The determination to conduct pedestrian survey in the ADI exclusively, rather than the entire APE, was based on the determination that the ADI represents the area of potential direct effects on archaeological resources.

The survey of the Project Site was accomplished by walking 10-meter-wide transects while closely inspecting the ground surface so that the entire accessible ADI was inspected for archaeological resources, including precontact and historic-era archaeological features and deposits. Areas within the ADI with exposed soils were intensely inspected during the pedestrian survey.

Because the ADI along the roadways was completely paved, Albion Archaeologists performed a dashboard survey consisting of driving on the roads and periodically stopping to observe surrounding soils to take photographs for documentation. The dashboard survey included a portion of Lindbergh Avenue, a gravel portion of De France Avenue, Zook Road, a small portion of Bushnell Road, Wescoat Road, Clark Road, Perimeter Road, and Ellis Street.

Approximately 0.12 mile of Zook Road and the entire 0.25 mile of Cummins Avenue were not subject to pedestrian survey due to restricted access. In addition, after Albion completed the pedestrian survey, a minor modification to the Limits of Work occurred along Cody Road. However, the survey conducted by AECOM between October 2023 and January 2024 encompassed all areas within the Limits of Work that Albion was not able to survey as part of the current study, as detailed in AECOM 2025:37–38. The methodologies employed by AECOM were comparable to those used in Albion's inventory, including inspection of all unpaved and undeveloped areas. Given the scope and rigor of the AECOM study, Albion regards it as a dependable reference for this inventory and assessment.

Once an artifact was encountered, surveyors inspected the area immediately adjacent to the find for additional materials. For the current study, isolated precontact finds were defined as those that contain fewer than 10 items per 10 square meters. Isolated historic finds were defined as consisting of fewer than three artifacts per 100 square meters (e.g., several fragments from a single glass bottle are one artifact). Generally, archaeological deposits with more than three items were considered a site. If a site was encountered, whether existing or previously unrecorded, its surface was carefully inspected and crew members pin-flagged all surface artifacts and features. After having established the site characteristics and boundaries, crews then collected all information needed to complete DPR primary site record forms (when applicable), took site overview photographs, and obtained Universal Transverse Mercator (UTM) coordinates using a Trimble GPS device. Isolated artifacts and sites were numbered consecutively within the survey area during the survey (e.g., Iso #1 or Albion BSC-Site-1). No artifacts were collected during the course of this survey.

Within the Project Site, three previously documented archaeological resources have been identified, comprising two precontact sites (CA-SCL-1145 and CA-SCL-1146) and one isolate (RP-Iso-03).

During the survey, Albion was responsible for their re-identification and assessment, employing the site recording methods previously outlined.

A Canine Forensic Survey was also conducted on the Project Site. The Institute for Canine Forensics provided five handlers and seven canines who conducted the survey throughout the entire Project Site. The Tamien Nation provided five tribal monitors to monitor each hander/canine team. See Appendix C of the Cultural Resource Inventory Report for a complete description of the methods of the Canine Forensic Survey.

3.5.2.2 Results of Built-Environment Resource Identification

Based upon the review of past evaluations and designations within the built-environment study area, as well as the new and updated evaluations conducted as part of the current investigation, the built-environment study area contains two individual built-environment resources that meet the eligibility requirements of the NRHP: Hangar One and Hangar Two. Furthermore, the built-environment study area contains a portion of the NAS Sunnyvale Historic District, which was originally listed in the NRHP and later expanded to include additional contributing buildings, structures, and landscape elements. These resources are described in greater detail in the following subsections. The results of the resource identification effort are also presented in Figures A-26 through A-28 in Appendix A of the Cultural Resource Inventory Report.

Hangar One

Hangar One (Building 1) was constructed between 1931 and 1933 at the east end of NAS Sunnyvale's original administrative campus. The Streamline Moderne-style structure measures approximately 1,100 feet long, 300 feet wide, and 200 feet tall. In 1988, the U.S. Navy engaged in consultation with the State Historic Preservation Officer (SHPO) through the Section 106 process and determined that Hangar One is eligible for NRHP listing under Criteria A (which recognizes sites of significant events) and C (which recognizes significant design, engineering, and construction qualities). Hangar One is listed in the California Office of Historic Preservation's Built-Environment Resource Directory with a CHRIS status code of 2S2 (determined eligible for listing with consensus determination).[2] Because Hangar One has been formally evaluated as eligible for NRHP listing with SHPO concurrence, the building meets the definition of a historic property for the purposes of Section 106 and NEPA review, as described in 36 CFR Section 800.16(l)(1). Because Hangar One has been determined eligible for NRHP listing, it is automatically listed in the CRHR (California Public Resources Code Section 5024.1(d)(1)) and qualifies as a CEQA historical resource pursuant to Section 15064.5 of the CEQA Guidelines.

Hangar Two

Hangar Two (Building 46) was constructed in 1942 and 1943 along the opposite (east) side of the airfield from Hangar One. The wood-framed Hangar Two was built parallel to the matching Hangar Three (subsequently demolished in 2024) following standardized U.S. Navy plans, and both structures originally housed blimps and other lighter-than-air aircraft that supported Moffett Federal Airfield's World War II missions. Hangar Two was evaluated as eligible for NRHP listing for the same U.S. Navy Section 106 undertaking as Hangar One, and it also meets the significance

[2] California Office of Historic Preservation. 2025. *Built-Environment Resource Directory, Santa Clara County.* Available: https://ohp.parks.ca.gov/?page_id=30338. Accessed: December 9, 2025.

requirements of NRHP Criteria A and C. Hangar Two is also listed in the California Office of Historic Preservation's Built-Environment Resources Directory with the assigned CHRIS status code of 2S2.[3] Like Hangar One, Hangar Two qualifies as a Section 106 historic property and as a CEQA historical resource.

U.S. Naval Air Station Sunnyvale, California Historic District

The NAS Sunnyvale Historic District was originally approved by the National Park Service and was listed in the NRHP in 1994. The historic district comprises the core 1930s-era campus of the NAS Sunnyvale, in addition to Hangar One and one remaining World War II-era aircraft hangar on the east side of the airfield. The original NRHP designation form concluded the district is eligible for NRHP listing under Criteria A and C and contained 43 contributing properties. Although most of the contributing properties are buildings and structures within the original NAS Sunnyvale administrative campus, the contributors also include small-scale features and landscape elements, including the memorial anchor, flagpole, and commons.[4]

In 2013, NASA oversaw a study of Moffett Federal Airfield's historical significance and NRHP eligibility. This study considered whether the airfield and associated facilities should contribute to the district. That study recommended that the historic district should be expanded to include the airfield and functionally related properties, such as ammunition storage structures within the safety buffer zone north of the airfield. The study also proposed a longer period of significance (1930–1961) that recognized Moffett Federal Airfield's historically significant jet operations during the early Cold War.[5] NASA provided the associated documentation of the proposed historic district expansion to the SHPO for review and concurrence. In its response, the SHPO concurred with NASA that the airfield and safety buffer zone contribute to the significance of the historic district and recommended that the study develop a list of properties that contribute to the expanded NAS Sunnyvale Historic District.[6] NASA subsequently compiled a list of contributing properties, which were included in the NASA ARC Integrated Cultural Resources Management Plan. The identified contributing properties included support facilities that line the edges of the airfield, paved runways, taxiways, parking aprons, and other features within the runway complex.[7]

Table 3.5-1 lists the identified extant contributors to the expanded NAS Sunnyvale Historic District that are located within the built-environment study area. These properties include 36 resources listed in the district's original NRHP designation form, 13 resources identified as historic district contributors through subsequent consultation between NASA and the SHPO, and three resources newly evaluated as historic district contributors during the current investigation. Consulting party review on the three newly evaluated district contributors is currently pending.

Cultural Resource Inventory Report included in Appendix 3.5-1 of this joint EIR/EIS.

Furthermore, NASA has identified several cultural landscape characteristics that contribute to the historical visual and spatial character of the expanded historic district's airfield. These included the following: flat topography; open views across aviation areas; long views north to salt ponds and San Francisco Bay; linear system of runways, taxiways, and associated airfield facilities; the presence of buildings and structures defining the edges of the airfield; visual dominance of Hangar One; views to Hangar Two across the airfield; and ongoing aviation use.[8]

3.5.2.3 Results of Archaeological Resource Identification

Known Archaeological Resources

The NWIC records search identified 155 previously recorded cultural resources within the APE, with an additional 40 recorded within a 0.5-mile radius. As shown in Table 3.5-2, there are 16 archaeological resources within the APE, including:

- Nine precontact archaeological sites (CA-SCL-14, CA-SCL-15, CA-SCL-16, CA-SCL-17, CA-SCL-18, CA-SCL-19, CA-SCL-20, CA-SCL-21, CA-SCL-24)
- One multi-component site (CA-SCL-864/H)
- Two recently recorded precontact archaeological sites (CA-SCL-1145, CA-SCL-1146)
- Four precontact isolates (RP-ISO-01 through -04)

[8] AECOM. 2013. Historic Property Survey Report for the Airfield at NASA Ames Research Center. Prepared for NASA Ames Research Center. Pages 5-4 through 5-6.

Three of these (CA-SCL-1145, CA-SCL-1146, and RP-ISO-03) are located in the ADI (Appendix A: Figure A-11 in the Cultural Resource Inventory Report). Albion's pedestrian archaeological survey of the ADI on May 15, 2025, re-identified the two previously documented sites (CA-SCL-1145 and CA-SCL-1146); based on survey results, Albion expanded the site boundary for CA-SCL-1145 to include additional materials observed just outside the recorded boundary. RP-ISO-03 was not re-identified. The survey also identified one newly discovered isolated scatter of approximately 30 to 40 freshwater clam shells (*Corbicula* sp.) in the Project Site: Albion-BSC-ISO-01. In addition, during the Canine Forensic Study, another concentration of shell fragments along with one green Franciscan chert flake was identified (Albion-BSC-ISO-02). The archaeological resources are described in Table 3.5-2 and illustrated in Appendix A: Figures A-11 and A-30 in the Cultural Resource Inventory Report.

Table 3.5-2. Archaeological Resources within the APE[9]

Trinomial Number/Primary Number	Description
CA-SCL-14/P-43-000034	Precontact occupation site
CA-SCL-15/P-43-000035	Precontact occupation site
CA-SCL-16/P-43-000036	Precontact occupation site
CA-SCL-17/P-43-000037	Precontact occupation site presumably covered by Moffett Federal Airfield
CA-SCL-18/P-43-000038	Precontact campsite with midden
CA-SCL-19/P-43-000039	Precontact occupation site probably destroyed by Moffett Federal Airfield
CA-SCL-20/P-43-000040	Precontact occupation site on mound with midden, a burial, a pestle, and hammerstone. The site could not be relocated.
CA-SCL-21/P-43-000041	Precontact occupation site on a very compact oval midden mound with burials
CA-SCL-24/P-43-000044	Precontact occupation site on a midden mound
CA-SCL-864/H/P-43-001825	Mixed component site. Precontact attributes include at least one burial, midden, shell, fire-affected rock, faunal bone, lithics, and awl fragments. Historic attributes include square nails, brick, bottle glass, metal, and slag.
CA-SCL-1145/P-43-4487	Low-density scatter of faunal shell and bone
CA-SCL-1146/P-43-4488	Low-density scatter of faunal shell
RP-ISO-1	Long bone from a single mammal
RP-ISO-2	Flake tool
RP-ISO-3	Rib bone from a mammal
RP-ISO-4	Human remains fragment

CA-SCL-14, -15, -16, -17 (P-43-000034–000037)

This cluster of small sites was originally noted in 1909 by N. Nelson in his analysis of San Francisco Bay Area (Bay Area) shell mounds conducted during the previous decade. In 1912, they were

9 These data are derived from the Cultural Resources Inventory Report for this project.

recorded by L. Loud as precontact occupation sites (Nelson 348-51). According to AECOM,[10] associated site records were updated in 1984 by Basin Research Associates Inc., including updated location maps. To date, these sites have not been evaluated and have not been rediscovered since their original recording in the early 1900s.

CA-SCL-18 (P-43-000038)

This site was originally identified in the early 1900s by N. Nelson during his analysis of Bay Area shell mounds and was formally recorded by L. Loud in 1912. The site was identified as one of Ynigo's campsites and is included in the Santa Clara County Heritage Resource Inventory under the Moffett Federal Airfield Indian Mound designation. Loud observed that the site had been nearly entirely destroyed. In 1991, Basin Research Associates conducted a survey but did not find any evidence of the resource on the ground surface, leading to the conclusion that the site was likely obliterated due to area development.[11] They determined that the site lacked the integrity necessary for NRHP eligibility; however, no subsurface testing was performed to validate this recommendation, and to date there is no documentation of SHPO concurrence with this finding. The site is mapped within the APE, but it falls outside the ADI. Consequently, project activities are not expected to cause any physical or direct impact on the site, and therefore, a formal archaeological evaluation is not necessary. Given the highly urbanized and previously disturbed nature of the environment, the likelihood of indirect impacts on archaeological resources within the APE or ADI—such as alterations to the site's setting—is minimal. As a result, these potential impacts do not warrant further assessment.

CA-SCL-19 (P-43-000039)

The site was initially documented by N. Nelson in 1909 and subsequently recorded in 1912 by L. Loud. Based on Nelson's description (Nelson 353), Loud classified the site as an occupation midden, which contains an accumulation of marine shell and faunal remains, likely significantly disturbed by the construction and operation of Moffett Federal Airfield. Since its original documentation, the site has undergone several updates from 2017 to 2020. In 2017, William Self Associates (WSA) and PaleoWest identified midden soils on the surface resulting from rodent back dirt piles. WSA reported the presence of oyster shell, marine snail shell, and faunal bone fragments, prompting the extraction of 13 core samples in a grid pattern to gain a better understanding of the site's deposits. The cores revealed a layer of dark midden soils containing artifacts and shells at approximately 80 centimeters (cm) below the ground surface. WSA estimated that the lower half of the midden soils remained largely intact and based on previous findings, may contain human remains. Consequently, the resource was recommended as eligible for the NRHP under Criterion D due to its potential to provide significant insights into the precontact occupation of the region.[12]

In 2018, WSA developed an Archaeological Data Recovery Plan for the Navigational Aids, Airfield Lighting, and Signage Replacement Project. The archaeological work involved the excavation of eight

12 Clark, T., E. Elliot, T. Young, and C Alonso. 2020. Archaeological Data Recovery Report, P-43-000039/CA-SCL-19, NAVAIDS Project, Moffett Federal Airfield Santa Clara County, California., Submitted to and on file with NASA.

control units and construction monitoring. During the construction monitoring, human remains were identified, necessitating a work stoppage and subsequent project redesign. The redesign involved transitioning from open trenching to horizontal directional boring beneath the intact archaeological deposit. Prior to the boring process, six control units were strategically placed along the bore path, along with two micro trenches at the entry and exit pits for the horizontal directional drill. Throughout this data recovery effort, one pit feature, nine intact burials, and isolated human remains were uncovered. A disturbed midden was documented to range from 15–40 cm below the surface (situated below a layer of sterile fill), with pit and burial features extending to about 90 cm below grade. Radiocarbon dating indicates that the site was most intensively occupied during an 800-year period between 2,300 and 1,500 years calibrated Before Present (cal BP), aligning with the Middle Period and Berkeley Pattern cultural manifestation. Additionally, two outlier radiocarbon dates were obtained from one charred bone sample (3,400 cal BP) and one obsidian hydration sample (900 +/- cal BP). Consequently, the boundary for CA-SCL-19 was expanded to the northeast and southeast. The north, west, and east boundaries remain poorly defined due to the presence of the existing runway and taxiway. This resource is eligible for the NRHP and is likely eligible for the CRHR. The site is mapped in the APE but is outside the ADI and is not likely to be physically affected by project activities. Additionally, the environment is highly urbanized and has been disturbed before. Because of this, the chance of affecting archaeological resources indirectly, such as changing the site's surroundings, is very low. Therefore, there is no need for further assessment of these impacts.

CA-SCL-20 (P-43-000040)

Originally identified by N. Nelson in 1909 and subsequently recorded in 1912 by L. Loud, the resource was documented as a significant occupation site featuring an earth mound designated as "Loud's Big Ynigo Mound." Loud described the mound as extending 0.6 mile in length and varying in depth from 2 to 5 feet, encircled by campsite deposits. Additionally, a single burial, a pestle, and a hammerstone were noted at the site. However, it was reported that the site had suffered considerable destruction.[13] In 1987, the California Department of Transportation (Caltrans) undertook a survey along with an Extended Phase I study but failed to relocate the site, a finding echoed by the Basin Research Associates' 1991 survey.[14] AECOM's 2025 Archaeological Resources Study documented several testing efforts that did not yield any subsurface deposits or evidence of

the resource.[15,16,17] To date, testing has been limited to the southern extent of the site boundary.. To date, this resource has not been formally evaluated for the NRHP or CRHR. Most of the site is mapped within the APE, but outside the ADI. As such, project activities would not physically affect the site and evaluation is not required. The environment is highly urbanized and has been disturbed before. Because of this, the chance of affecting archaeological resources indirectly, such as changing the site's surroundings, is very low. Therefore, there is no need for further assessment of these impacts.

CA-SCL-21 (P-43-000041)

Originally identified by N. Nelson in 1909 (known as the Third Ynigo Mound) and later recorded in 1912 by L. Loud, this resource was documented as an occupation site featuring a 4-foot-high, oval-shaped compact earthen mound. David Chavez & Associates[18] conducted an NRHP cultural resource evaluation of the site, noting a significant likelihood that CA-SCL-21 contained intact subsurface deposits. Consequently, augers and test units were excavated; however, no archaeological resources were found within or immediately adjacent to the site boundary. Given these negative results, it was concluded that CA-SCL-21 had either been destroyed or was not mapped correctly. The site record for this resource was updated by Basin Research Associates, Inc. in 1984. The site is mapped within the APE, but outside of the ADI. Project activities would not physically affect the site and therefore evaluation is not required. In addition, the environment in question is predominantly urbanized and has experienced prior disturbances. Consequently, the likelihood of indirect impacts on archaeological resources—such as alterations to the site's immediate surroundings—is minimal. As a result, additional assessments concerning potential impacts are deemed unnecessary.

CA-SCL-24 (P-43-000044)

Documented by N. Nelson and L. Loud in 1909 and 1922, respectively, this resource is characterized as an occupation mound. In 1981, David Chavez & Associates conducted an NRHP cultural resource evaluation, noting the presence of potential midden soils and artifacts on the surface (including a bone awl, a pestle fragment, and three chert tools) suggesting a high likelihood that CA-SCL-24 contained intact subsurface deposits. However, exploration of the site using augers and Standard Test Units (STUs) revealed a sparse accumulation of highly fragmented shell, indicating that the site has likely been destroyed. The site record for this resource was subsequently updated by Basin Research Associates, Inc. in 1984. The likely NRHP and CRHR eligible site is mapped within the APE, but outside of the ADI. Project activities would not physically affect the site and therefore further evaluation is not required. Additionally, the local environment is predominantly urbanized and has

experienced prior disturbances. As such, the likelihood of indirect impacts on archaeological resources—such as alterations to the site's immediate surroundings—is minimal. As a result, additional assessments concerning potential impacts are deemed unnecessary.

CA-SCL-864/H (P-43-001825)

Originally recorded in 2006 by Albion Environmental, Inc., this resource is a multicomponent archaeological site.[19] The precontact component features a human burial and a midden containing shell, bone, charcoal, fire-affected rock, lithic tools, and debitage. The historic component includes square nails, brick, glass, metal, and slag, likely linked to military housing constructed in the 1930s, which falls within the documented site boundary. Substantial subsurface deposits were documented during Albion's subsequent Extended Phase I study; however, the age of the deposit was not determined due to a lack of materials suitable for radiocarbon dating. AECOM suggested that the site may be associated with nearby CA-SCL-21 and CA-SCL-24, which were "part of the original Loud site recordings of the early 20th century, and which have ill-defined locations and have not been fully rediscovered or studied."[20] To date, the resource has not been evaluated for listing on local, state, or federal registers. The site is mapped within the APE, but outside of the ADI. As such, project activities would not physically affect the site and therefore evaluation is not required. The environment is highly urbanized and has been disturbed before. Because of this, the chance of affecting archaeological resources indirectly, such as changing the site's surroundings, is very low. Therefore, there is no need for further assessment of these impacts.

CA-SCL-1145 (P-43-004487)

This resource comprises a low-density scatter of faunal shell and bone fragments.[21] The shell assemblage includes fragments from three bent nose clams (*Macoma nasuta*), two oyster fragments (*Ostrea lurida*), and two horn snail shells (*Cerithideopsis* sp.). Additionally, a fragment of a calcined mammal long bone was observed. Given the species of faunal shell identified, this resource may represent precontact dietary remains from one of the many nearby recorded mound sites that have previously been disturbed, likely indicating redeposited soils and cultural materials. Despite this evidence for surficial disturbance, there is still a possibility that intact subsurface precontact deposits exist at this location. Most of the site is mapped within the Project Site portion of the ADI. Given the potential for physical (direct) impacts by the proposed project, this resource should be treated as eligible for inclusion in the CRHR and NRHP.

CA-SCL-1146 (P-43-004488)

This resource consists of a low-density, highly fragmented shell scatter within a 20-meter-diameter area.[22] The identifiable shells are predominantly from the oyster species (*Ostrea lurida*). The condition of the fragments indicates that the site may represent precontact dietary remains, potentially originating from one of the many nearby recorded mound sites that have been significantly disturbed and redeposited during prior development in the area. Although the surface

21 Ibid.

22 Ibid.

materials likely do not constitute a primary (intact) cultural deposit, there remains the potential for intact subsurface deposits. The site is situated along the eastern border of the Project Site within the ADI. Given the potential for physical (direct) impacts, this resource should be treated as eligible for inclusion in the CRHR and NRHP.

RP-ISO-01

This resource consists of a fragment of a long bone from a single mammal; it is likely to be either historic or modern in age; however, this has not been confirmed.[23] The resource is located within the APE, just outside the boundary of the Project Site within the ADI. Given the absence of additional cultural materials (e.g., artifacts, midden soils), the resource is likely not eligible for state or federal registers, and no further evaluation is needed.

RP-ISO-02

This resource includes a single flake tool identified within a rodent spoil pile located adjacent to a building foundation.[24] The artifact is crafted from green chert, measuring 47.5 cm long and 13 mm thick. The resource is in the APE, outside the boundary of the ADI. Given the absence of additional cultural materials (e.g., artifacts, midden soils), the resource is likely not eligible for state or federal registers, and no further evaluation is needed.

RP-ISO-03

This isolate is a solitary rib bone fragment from a mammal. It is mapped within the Project Site in the ADI. The presence of potential saw-cut marks indicates that it likely originated from a historical or contemporary context, rather than from a precontact site; however, this has not been confirmed.[25] Given the absence of additional cultural materials (e.g., artifacts, midden soils), the resource is likely not eligible for state or federal registers, and no further evaluation is needed.

RP-ISO-04

Documented in 2023, this isolate includes a single fragment of human bone, likely redeposited from one of the numerous precontact mounds documented in the general vicinity.[26] The resource is located in the APE, just outside the eastern boundary of the Project Site within the ADI.

According to the DPR Primary Record, the bone was removed and NASA is consulting with Ohlone representatives to rebury the remains.

Survey Results

During Albion's pedestrian survey of the large 40-acre survey area, previously recorded P-43-004487 and P-43-004488 were identified; however, RP-Iso-03 was not found. Additionally, a new resource was recorded as Albion BSC-ISO-01. No precontact or historic-era artifacts were observed on the surface of the 2.4 miles of road within the ADI.

23 Ibid.

24 Ibid.

25 Ibid.

26 Ibid.

Surface visibility was poor across the entire ADI, with approximately 80 percent of the ground surface obscured by paved roadways, walkways, parking lots, buildings, and concrete pads from demolished buildings. Approximately 12 percent was covered by vegetation (grasses, shrubs, trees), leaving about 8 percent of the ADI visible for inspection. The areas devoid of any hardscaping consisted of barrier planters in parking lots, roadside embankments, empty building lots (previously razed), and landscaped areas associated with existing buildings. In the areas devoid of hardscaping, every effort was made to closely inspect areas free of heavy vegetation cover (e.g., spoils from ground burrowing animals/dens).

Survey Constraints

Due to restricted access, surveying was not possible for approximately 0.12 mile of Zook Road, located between Hall Road and the NASA Ames Fire Department. Additionally, the entire 0.25 mile of Cummins Avenue could not be surveyed. In addition, after Albion completed the pedestrian survey, a minor modification to the Limits of Work occurred along Cody Road. However, the survey conducted by AECOM between October 2023 and January 2024 encompassed all areas within the Limits of Work that Albion was not able to survey as part of the current study, as detailed in AECOM 2025:37–38. The methodologies employed by AECOM were comparable to those used in Albion's inventory, including inspection of all unpaved and undeveloped areas. Given the scope and rigor of the AECOM study, Albion regards it as a dependable reference for this inventory and assessment.

Resources Identified

During the survey, the team successfully located the two previously documented sites (P-43-004487 and P-43-004488); however, RP-ISO-03 was not found. During the survey, an isolated scatter of approximately 30 to 40 freshwater clam shells (*Corbicula* sp.) was observed (Albion-BSC-ISO-01). A detailed description of each resource and its current condition is provided below.

P-43-004487 (CA-SCL-1145)

Site conditions observed during the 2025 survey were generally consistent with previous observations. However, in addition to the shell observed in the "narrow planting strips," oyster shell fragments and horn snail shells were also observed in larger quantities west of the recorded site boundary (Appendix A: Figures A-30 and A-32, Photographs 7–9 in the Cultural Resource Inventory Report). Therefore, Albion has expanded the site boundary for CA-SCL-1145 to include these additional materials. Crews did not observe any mammal bone or bent nose clam fragments. The soils observed were a dark gray (Munsell 10YR 4/1) clay loam. The area has previously been affected by development activities and rodent burrowing.

P-43-004488 (CA-SCL-1146)

This resource was relocated during the 2025 survey effort; however, the oyster shell was observed solely within a substantial rodent back dirt pile (Appendix A: Figures A-29, A-30, A-32, and A-33 in the Cultural Resource Inventory Report). The soils observed were a dark gray (Munsell 10YR 4/1) clay loam. Areas immediately adjacent to the site boundary appear to have been significantly affected by modern disturbances, such as underground utilities and roads.

Albion BSC-ISO-01

During the survey, a scatter of approximately 30 to 40 freshwater clam shells (*Corbicula* sp.) (Albion-BSC-ISO-01) was observed within the ADI (Appendix A: Figures A-29, A-30, and A-33 in the

Cultural Resource Inventory Report). The surrounding soil is a dark grayish brown (Munsell 10YR 4/2) silty loam interspersed with imported gravels. The genus identified is non-indigenous and was likely introduced to the United States around 1945[27]; it is commonly associated with fluvial and slough environments characterized by silty loam substrates. Specimens observed during the survey range from 1 to 4 cm in maximum length and exhibit minimal weathering, including the presence of extant periostracum. Based on the taxa represented, depositional context, and condition of the specimens, Albion determined that the shell scatter does not constitute an archaeological deposit (precontact or historic) and was most likely introduced inadvertently through the placement of imported fill.

Canine Forensic Survey Results

A Canine Forensic Survey was also conducted on the Project Site, and the results were positive. The canine team alerted at several locations (including two high-density alert zones: ZK1 and BB9), suggesting that human remains are likely present in the Project Site. See Appendix C in the Cultural Resources Inventory Report for a complete description of the results of the Canine Forensic Survey.

Albion-BSC-ISO-02

During the Canine Forensic Survey, the field team identified an isolated artifact scatter (Albion-BSC-ISO-02) (Appendix A: Figures A-29, A-30, and A-33 in the Cultural Resource Inventory Report). The scatter consists of 17 artifacts—16 shell fragments and one green Franciscan chert flake—concentrated within an approximately 1 by 2-foot area. Surface soils are characterized as a brown (10YR 5/3) sandy clay loam. The shell assemblage comprises the following: four oyster (*Ostrea* spp.) fragments, four unidentifiable bivalve fragments, one horned snail (*Ceratostoma* spp.), one button shell (*Trimusculus* spp.), and six fragments of unidentifiable shell. All shell specimens exhibit heavy weathering. The degree of weathering, combined with the disturbed surface context of the deposit, suggests this scatter does not represent an in-situ archaeological deposit. Per the Tamien Nation's request, these artifacts were collected by Albion. They will be returned to NASA at the conclusion of the project.

Sensitivity Assessments

A study from 1991 concluded that post-1931 utility lines and other improvements appear to have destroyed the integrity of any precontact or historic-era archaeological resources within the Ames facility.[28] However, the methods and results of this study are brief, generalized, and based primarily on anecdotal evidence. The authors provide little concrete data that such improvements destroyed all intact archaeological deposits and none for the ADI. Further, subsequent studies have identified intact archaeological resources and human remains within the Ames facility, deemed eligible for the

NRHP, e.g., CA-SCL-19 and CA-SCL-864/H, disproving the hypotheses made in the 1991 study.[29,30] As such, the conclusions of this earlier study cannot be relied on in developing sensitivity assessments for the current proposed project. Instead, Albion concurs with a more recent sensitivity study conducted by AECOM.

Precontact Site Sensitivity

Near-Surface Site Sensitivity

The presence of 12 archaeological sites with precontact components in the APE indicates a significant sensitivity for additional precontact resources. These known sites reflect the long history of occupation in the San Francisco Bay region, dating back at least 11,000 years. Archaeological research has shown that the diverse ecological characteristics of the South Bay and northern Santa Clara Valley supported large populations who established their residential communities in productive environments, including tidal marshlands, grassland prairies, oak woodlands, and riparian corridors.

Many of these sites were initially documented during Nels Nelson's survey of shell mounds conducted from 1907 to 1908 in the Bay Area. Of the 425 mound sites that he recorded, many were already suffering from extensive erosion and destruction from urban development. The locations were subsequently recorded and mapped in greater detail in 1912 by archaeologist Lewellyn Loud from UC Berkeley.

Over the past four decades, numerous investigations have been conducted on these resources. A majority were conducted in coordination with various projects including cultural resource evaluations, highway and road improvements, and underground utility installments. Many of these studies attest to the highly disturbed nature of these resources, with a significant number of these reported as completely removed or buried due to grading and filling activities that occurred during the 20th century.

Within the current APE, intact deposits have been reported at three locations indicating heightened sensitivity for near-surface precontact archaeological resources. At CA-SCL-20 (about 360 meters east of the ADI), Loud documented intact midden deposits extending between 2 and 5 feet below grade, with the upper 22 inches exhibiting significant disturbance. While a number of subsequent studies failed to confirm Loud's findings, researchers surmise that there remains potential for intact portions of the site to exist beneath the current ground surface. Furthermore, there is a substantial likelihood that precontact features, such as hearths and burials, may extend below these seemingly disturbed deposits.

This assessment is bolstered by recent trenching and data recovery excavations at CA-SCL-19 (about 600 meters east of the ADI), which revealed consistent stratigraphy throughout the site. The findings demonstrate approximately 25 cm of sterile surficial fill overlaying about 15 cm of

[29] Garlinghouse, T., and M. Hylkema. 2006. Extended Phase I Study of the Berry Court Archaeological Site. On file at the Report prepared for Larry Moore, CTSC, Environmental Division, US Army Reserve Contracting Center, Fort Hunter Liggett, California.

[30] Clark, T., E. Elliot, T. Young, and C Alonso. 2020. Archaeological Data Recovery Report, P-43-000039/CA-SCL-19, NAVAIDS Project, Moffett Federal Airfield Santa Clara County, California., Submitted to and on file with NASA.

disturbed shell midden deposits, followed by 35 to 50 cm of dark sub-midden deposits containing pit features and burials.[31]

An intact precontact component was also identified at CA-SCL-844/H about 200 meters southwest of the ADI (Project Site). Investigations here revealed midden deposits and a human interment at about 40 cm, situated within an elevated area described as a grassy knoll. Archaeological deposits surrounding the knoll were highly mixed, containing precontact and historic age materials.[32] In their archival review of areas in NASA ARC, AECOM proposed that the site may be associated with nearby CA-SCL-21 and CA-SCL-24; however, both of these are mostly destroyed or at least highly obscured by historic and modern development.[33]

Based on these findings, AECOM assessed NASA ARC, including the areas within current the APE, as sensitive for surface and near-surface precontact archaeological resources. Specifically, they recommended high sensitivity be assigned to all known archaeological resources, each with a 300-foot buffer to account for potential imprecision in the original recording of these resources as well as the potential for associated subsurface deposits beyond the current recorded site boundaries (Appendix A: Figure A-34 in the Cultural Resource Inventory Report). Several portions of the ADI overlap with areas deemed highly sensitive for surface and near-surface deposits (i.e., areas involving P-43-004487 and P-43-004488) including areas within the Project Site, demolition along Bailey Road, and utility improvements along Perimeter Road (Appendix A: Figure A-35 in the Cultural Resource Inventory Report).

Several areas of the ADI fall outside areas deemed to have heightened sensitivity by AECOM; however, numerous studies within NASA ARC have shown that historic and modern-era urban development has significantly altered, removed, or buried archaeological deposits, signaling that surface expressions are unreliable indicators of near-surface deposits. Accordingly, Albion recommends considering the entire ADI as sensitive for surface and near-surface archaeological deposits. These types of resources are typically explored via manual or mechanical archaeological excavation or near-surface geophysical techniques such as ground-penetrating radar.

Buried Landform Sensitivity (Deeply Buried Archaeological Sites)

San Francisco Bay, formerly a stream valley during the Pleistocene, became a bay about 8,000 years ago when world temperatures rose and melting glaciers made sea levels rise accordingly.[34] With the rise of bay waters, sediment and debris from the Sacramento Valley catchment and the San Joaquin Valley catchment commenced to back up, forming what is known today as the Sacramento–San Joaquin Delta. By the mid-to-late Holocene, the Bay estuary expanded as a result of subsidence and compaction of intertidal deposits. High sea levels in southern San Francisco Bay enabled estuarine

environments to migrate southward. Consequently, precontact human populations may have had to move inland in response to the estuary expansion. Since the 1850s, tidal marshes along the Bay margins have shrunk by 50 percent, placing the current shoreline where it would have been 5,000 years ago.

Previous research on geology, soils, bay and estuary formation, and flood events have illustrated how precontact archaeological resources are often buried under recent alluvial deposits. Modern roadways and building construction have further obscured these resources, rendering traditional ground surface surveys inadequate for identifying these types of resources.

In recent years, geoarchaeological studies have made great strides in assessing potential for buried landforms, significantly increasing the ability to identify resources. One such investigation involved a comprehensive geoarchaeological study of the Santa Clara Valley conducted in conjunction with the Caltrans Route 87 Guadalupe Parkway Upgrade project.[35,36] The project included a review of archaeological sites in the South Bay to understand the relationship between site distribution and landform deposits.

The study compared the frequency of surface and buried sites with several contexts including alluvial flood plain deposits (Qhfp), flood basin deposits (Qhb), and natural levee deposits along major streams (Qhl). Precontact archaeological deposits have been found in each context with flood plain deposits (Qhfp) containing the highest concentration of sites, followed by basin (Qhb) and levee deposits (Qhl). The study found that buried sites occur in all contexts, accounting for between 55 and 70 percent of the total sites for each landform, a finding confirmed in later geoarchaeological studies of the Santa Clara Valley.[37] Analyses have shown that buried sites are not randomly distributed across this landscape; rather, they are influenced by specific environmental and geomorphic factors, including proximity to water, the slope of the landform (with flatter areas being more sensitive), and the relative age of the landform, where generally younger formations tend to be more sensitive.

Based on the regional studies conducted in the Santa Clara Valley, one might assume it is reasonable to conclude that all areas within the ADI (mapped entirely in Qhb) should be regarded as sensitive for precontact deposits, both near surface and buried. However, AECOM, in their geoarchaeological assessment of NASA ARC, suggests that the basin deposits in the vicinity differ from those in other parts of the valley and are not sensitive due to the absence of freshwater streams or rivers that would have created a highly favorable depositional environment.[38] Additionally, the characteristics of Hangar One soils, which comprise the basin deposits, are heavily saturated (with seeps and springs) and unsuitable for habitation, except for elevated topographic features such as knolls and natural levees adjacent to the basin soils.

38 AECOM. 2025. Archaeological Resources Study: NASA Ames Research Center. Prepared for NASA by AECOM, NASA Ames Research Center, Moffett Field, California.

AECOM's archaeological assessment included a review of data from geoprobe cores excavated for a Caltrans project along U.S. 101 near Moffett Boulevard.[39] The investigation identified several locations with evidence for paleosols (buried surfaces), though their depth varied widely (4 to 16.5 feet below surface) and most likely formed within freshwater marsh or pond environments, suggesting low potential for archaeological sensitivity. AECOM posits that the buried landform was covered by sediment and stopped receiving organic material during the early Holocene. This surface was covered by fine alluvial deposits, which may show the change from a freshwater marsh to a low-energy alluvial fan or floodplain, a change that may be linked to increased floodplain buildup from nearby Stevens Creek as sea levels rose quickly in San Francisco Bay between about 10,000 and 8,000 years ago.

This interpretation is reinforced by their analysis of a database containing hundreds of previous geotechnical investigations conducted at NASA ARC. These investigations indicate that the ARC vicinity was characterized by numerous "aggrading and anastomosing" stream channels during the late Pleistocene and early Holocene, prior to the inundation of the Bay and the formation of the basin landform. The variability in subsurface conditions, along with the presence of numerous high-energy features, further diminishes the likelihood of encountering preserved, deeply buried precontact archaeological resources.

In comparing the various lines of evidence from the local record with those from other areas of the Santa Clara Valley that feature younger alluvial landforms near major streams, AECOM suggested that NASA ARC likely has only a moderate potential for containing precontact archaeological sites that may be buried due to natural geomorphic processes. As a result, comprehensive subsurface geoarchaeological investigations, such as mechanical excavation or coring aimed at revealing buried landforms, were considered unnecessary for the assessment of deeply buried archaeological resources.

This recommendation applies to the entirety of the ADI (Appendix A: Figure A-35 in the Cultural Resource Inventory Report). Notably, heightened sensitivity for geoarchaeological resources was indicated at the northern boundary of NASA ARC (northern portion of the current APE, out of the ADI), where recent Bay muds and related estuary sediments may conceal older terrestrial landforms (Appendix A: Figure A-34 in the Cultural Resource Inventory Report).

Historic-Era Site Sensitivity

Sensitivity in the APE

AECOM prepared a recent sensitivity assessment of historic-era archaeological resources for NASA ARC within a study area very similar to the current APE (Appendix A: Figures A-34 and A-35 in the Cultural Resource Inventory Report).[40] For this assessment, they divided the facility's history into two distinct periods: the period prior to 1931 dominated by rural agriculture and the period after 1931 defined by military and research development. AECOM concluded that the potential for significant archaeological resources from the military period is very low because of strict waste management protocols preventing refuse accumulation and detailed record keeping documenting

39 URS Corp. 2014. Historic Property Survey Report, US 101 Express Lanes Project, Santa Clara County, California. On file at the Prepared for State of California Department of Transportation District 4, On file at the Northwest Information Center, Sonoma State University, California.

40 AECOM. 2025. Archaeological Resources Study: NASA Ames Research Center. Prepared for NASA by AECOM, NASA Ames Research Center, Moffett Field, California.

material life at the facility better than archaeology could. They, therefore, focused their sensitivity assessment on the pre-1931 agricultural period when the area was dominated by farms and coastal transportation and shipping, and Albion concurs with their methods and results.

AECOM based their mapping of elevated pre-1931 historic-era archaeological sensitivity primarily on farmsteads depicted on archival maps with an added 200-foot buffer around each one, as there is only one previously recorded archaeological site with a historic-era component within the boundaries of NASA ARC (or within the current APE), CA-SCL-864/H (P-43-001825) (Appendix A: Figures A-11 and A-34 in the Cultural Resource Inventory Report). In particular, they relied on the 1876 Thompson & West map, 1897 U.S. Coast and Geodetic Survey T-sheet, and 1899 U.S. Geological Survey topographic map, plus data from the 1859 Rancho Posolmi plat and 1873 Geological Survey of California map (Appendix A: Figures A-13, A-14, A-15, A-17, and A-18 in the Cultural Resource Inventory Report). The most detailed and accurate of these maps, they noted, is the 1897 T-sheet, with other documents like the 1876 Thompson & West map much less precise. When overlain on current project boundaries, results show that historic farmsteads were concentrated along the eastern side of the APE east of the runways and in the southwest portion of the APE in and adjacent to the ADI.

AECOM reported that there are few detailed records of cutting and filling within the Ames facility in the post-1931 era and it is not possible to determine whether buried archaeological deposits associated with any particular farm depicted on historic maps were preserved or destroyed by subsequent earthmoving activity. This includes areas of the APE where buildings and other improvements currently exist or once existed. AECOM therefore recommends assuming that all farmsteads depicted on historic maps have at least moderate archaeological potential. In contrast, AECOM concluded based on as-built drawings that Whisman's/Bernard's/Jagel's Landing in the northern part of the current APE was destroyed by over excavation during extension of the runways in the 1950s and is no longer sensitive.

The one previously recorded archaeological site in the APE with a historic-era component is CA-SCL-864/H (P-43-001825). The site is located approximately 250 meters southwest of the triangular Project Site portion of the ADI and comprises disturbed and mixed deposits of precontact and historic-era materials in the top 60 cm based on subsurface testing in 2006.[41] Historic artifacts identified during testing included ceramic brick and tile, mortar, ceramic tableware, bottle and window glass, slag, metal nails, and unidentified metal. Unfortunately, it was not possible to date these artifacts with any precision, and they could be from the pre-1931 agricultural period or post-1931 military period. However, the presence of machine-cut nails, which are relatively rare after the 19th century, suggests that at least some of this material dates to the agricultural period. For the purposes of the current study, the presence of historic-era artifacts in proximity to the ADI, albeit in a disturbed context, indicates that historic-era archaeological deposits may also survive within the ADI itself, some of which may remain intact.

Sensitivity in the ADI

Consistent with the APE more broadly, sensitivity for historic-era archaeological resources within the ADI is associated with historic farmsteads depicted on archival imagery, as there are no previously recorded historic-era archaeological sites in the ADI.

41 Garlinghouse, T., and M. Hylkema. 2006. Extended Phase I Study of the Berry Court Archaeological Site. On file at the Report prepared for Larry Moore, CTSC, Environmental Division, US Army Reserve Contracting Center, Fort Hunter Liggett, California.

In particular, there is moderate to high potential for historic-era archaeological resources associated with one farmstead that falls within the triangular Project Site portion of the ADI. The road later known as Whisman Road passed north through this part of the ADI on its way to Whisman's Landing starting in the 1850s or earlier and remained the main travel corridor to and from the waterfront through the 1920s. It is clearly shown on most historic maps of the area and aligns approximately with current Dailey Road. The 1876 Thompson & West Map shows a farmyard, including buildings and an orchard associated with Evan Jenkins abutting the east side of Wisman Road within the ADI and the 1897 T-Sheet shows this farm in greater detail. This farm was later owned by J.L. Azevido in the 1910s and A.M. Meteiros in the 1920s. As discussed by AECOM, the accuracy of the 1876 map is limited, and Albion will rely here on the far more accurate 1897 T-Sheet. Overlaying the T-Sheet on the modern landscape, any surviving archaeological deposits associated with this farmstead would probably be in the vicinity of the NASA Lodge, the parking lot to the north, and the parking lot and grassy field east of Gorsky Road, approximately the area bounded by Dailey Road, Edquiba Road, and Kaiser Road (Appendix A: Figures A-35 and A-36 in the Cultural Resource Inventory Report). Such archaeological deposits could include buried structural remains and household and agricultural refuse associated with the Jenkins and later occupations. Post-1931 historic aerial photos show that, while a series of temporary military dwellings were located here in the 1940s, they appear to have had only limited subsurface impacts, and by the 1960s most of these buildings were gone and the location of the historic farmstead in the ADI contained substantial open space (Appendix A: Figure A-36 in the Cultural Resource Inventory Report). This limited post-1931 development increases the potential for intact historic-era archaeological deposits within the Project Site.

The linear portions of the ADI intersect with other sections of historic Whisman Road and some agricultural fields and orchards depicted on historic maps (Appendix A: Figure A-20 in the Cultural Resource Inventory Report). However, they do not overlap with any dwellings or farmyards, places where archaeological deposits tend to be concentrated. Whisman Road itself has very low archaeological sensitivity because it is well documented on historic maps and has little data potential. As such, the sensitivity for intact historic-era archaeological deposits with research potential in these areas is low. One exception is Whisman's property and ditch shown on the 1859 map of Rancho Posolmi, which overlap with part of the linear ADI in the southwest corner of the APE (Appendix A: Figure A-13 in the Cultural Resource Inventory Report). However, this part of the ADI consists of utility upgrades within existing roads, and it is possible that prior construction has destroyed any archaeological deposits in these locations. Sensitivity here, then, is low to moderate.

3.5.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as

applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies.

Plans, policies, and regulations considered in the analysis of the proposed project's impacts related to cultural resources are identified in the Cultural Resource Inventory Report (Appendix 3.5-1 to this joint EIR/EIS). A list of plans, policies, and regulations considered in the analysis is provided below:

- National Historic Preservation Act
- NASA-Wide Programmatic Agreement under Section 106
- National Register of Historic Places
- NASA Procedural Requirement 8510.1A: Cultural Resource Management
- NASA Ames Research Center Historic Resources Protection Plan
- NASA ARC Integrated Cultural Resources Management Plan
- NASA ARC Design Review Program
- California Register of Historical Resources
- California Environmental Quality Act

3.5.4 CEQA Findings

The following sections describe the environmental impacts of the proposed project on cultural resources in accordance with CEQA. The sections describe the thresholds used to determine whether an impact would be significant and methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts on cultural resources, in accordance with NEPA, is provided separately in Section 4.5.5, *Cultural Resources*, in Chapter 4, *Environmental Impact Statement*.

3.5.5 Thresholds of Significance

In accordance with Appendix G of the State CEQA Guidelines, the project would have the potential to have a significant effect on cultural resources if it would result in any of the conditions listed below.

Would the project:

- Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?
- Cause a substantial adverse change in the significance of an archaeological historical resource pursuant to Section 15064.5 or a unique archaeological resource (California Public Resources Code [PRC] Section 21083.2)?

- Disturb any human remains, including those interred outside of dedicated cemeteries?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to cultural resources?

3.5.6 Methods for Analysis

3.5.6.1 Built-Environment Resources

Under CEQA, assessment of project impacts on built-environment resources considers the project's potential to alter physical features and qualities that support a significant resource's historical integrity and ability to convey its significance. Any amount of change to a resource or its setting does not automatically equate to a significant impact. Instead, the State CEQA Guidelines explain that a significant impact would occur when the project proposes to materially impair the resource's significance—that is, alter the resource's character-defining features (including important aspects of its setting) that qualify it for historical register listing or that have supported its identification in a local historical resources survey.

Material impairment of a significant built-environment resource can be caused by construction activities that change the physical features of the resource itself, particularly through demolition, damage, relocation, or insensitive alteration. A project that would retain a significant built-environment resource but change its physical characteristics (for instance, a rehabilitation or construction of an addition) should be analyzed using the Secretary of the Interior's Standards. The State CEQA Guidelines specify that a project meeting the Secretary of the Interior's Standards is presumed not to result in a significant impact (Section 15064.5(b)(3)).

Even if a project does not propose changes to the physical elements of a significant built-environment resource, damage to the resource could still occur resulting from groundborne vibration produced from construction activities taking place in the vicinity. It is hypothetically possible that some construction methods could produce vibration reaching such intensities that it would damage a nearby historic property's character-defining features. Section 3.12, *Noise*, of this joint EIR/EIS presents analysis of the project's potential to cause vibration; the following analysis discusses how such vibration levels have the potential to result in impacts to historical resources. Furthermore, a built-environment resource may still sustain a significant impact if important features or qualities in its vicinity are perceptibly changed. Such an impact would occur if the resource's integrity of setting, feeling, or association were altered in a manner that reduces the resource's ability to convey its significance. The State CEQA Guidelines note that significant impacts can result from changes to a resource's "immediate surroundings." In these scenarios, the impacts analysis should consider whether the proposed project would remove, obstruct, or change elements in a resource's setting that allow it to express its historically or architecturally significant character. Permanent changes in atmospheric conditions, such as increased noise or vibration levels, may constitute an adverse effect if a quiet setting is closely tied to the resource's reasons for significance. Generally, noise or vibration occurring during construction are temporary and would have a limited impact on a significant resource's setting characteristics.

3.5.6.2 Archaeological Resources

The proposed project may cause a significant impact on archaeological resources in a number of ways, including complete or partial destruction during demolition and construction of new facilities,

utility work, road construction, and landscaping. A determination of a significant impact is based on a comparison of project plans (e.g., breadth and depth of grading or excavation) and the physical characteristics of the archaeological deposit. The determination also considers the integrity of the resource and the aspects of the resource that contribute to its significance. If, for example, an archaeological resource is found to lack integrity, and therefore has no potential to contribute meaningful data to address research questions, there will be a finding of no impact. Similarly, the project may affect a portion of a significant resource, but only the portion that does not have the potential to contribute meaningful data, resulting in a determination of no significant impact. A determination of a significant impact leads to consideration of mitigation measures to reduce project impacts.

3.5.7 Impacts and Mitigation Measures

Impact CEQA-CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation

CEQA Proposed Project (NEPA Build Alternative 1)

The following analysis discusses potential impacts on built-environment historical resources that could be caused by construction of the CEQA Proposed Project. The analysis first addresses the CEQA Proposed Project's potential to alter the physical characteristics of significant built-environment resources (including demolition), then discusses potential vibration-related damage to individual historical resources and historic district contributors, and finally assesses potential changes in the setting of historical resources.

Changes in Physical Characteristics

As described in the Cultural Resource Inventory Report (Appendix 3.5-1 of this joint EIR/EIS), none of the buildings in the Project Site that would be demolished to accommodate project construction

meets the definition of a CEQA historical resource individually or as contributors to the U.S. Naval Air Station (NAS) Sunnyvale Historic District. Therefore, construction of the CEQA Proposed Project would not involve the demolition of any significant built-environment historical resources.

Hangar One stands approximately 125 feet north of the Project Site's northeast corner, and Hangar Two is located on the east side of the airfield, more than 3,000 feet from the eastern edge of the Project Site. Construction of the project would not alter the physical characteristics of these NRHP-eligible resources. However, the Project Site extends a short distance into the expanded NAS Sunnyvale Historic District, and the project proposes alterations to a limited number of contributing properties. The project proposes to shift Cody Road from its current alignment to a new location approximately 80 feet to the east. South of Hangar One, the realigned roadway would encroach into the NAS Sunnyvale Historic District and would overlap with a portion of MF1002, an aircraft parking apron that has been identified as a historic district contributor. The realignment of Cody Road would extend approximately 50 feet east into the boundary of the NAS Sunnyvale Historic District and would disturb approximately 11,000 square feet (or 0.25 acre) of MF1002, which is currently characterized by a surface of level, paved concrete. The affected parking apron retains the gridded pattern of the concrete squares that characterized the resource during the historic district's period of significance. The portion of MF1002 that would be disturbed by the project constitutes a small portion of the entire parking apron, which measures approximately 1,700,000 square feet (almost 40 acres) to the south and east of Hangar One. Therefore, the size of the affected parking apron would be decreased by less than 1 percent of its total area, and following project construction MF1002 would still clearly convey its historical role supporting aircraft circulation between Hangar One and the adjacent airfield. In addition, the project proposes to alter the Wescoat Road roadway to accommodate a new traffic configuration, which would entail shifting the south curbline. Construction equipment in Wescoat Road would be used in proximity to five streetlights that currently stand north of the street's existing curbline. Another off-site utility corridor would be installed in the Cummins Avenue roadway, which leads past six streetlights. As detailed in the Cultural Resource Inventory Report (Appendix 3.5-1 of this joint EIR/EIS), the current investigation evaluated the 48 extant original streetlights within the NAS Sunnyvale Historic District, which includes those standing along Wescoat Road, and concluded they qualify as a contributing element of the historic district.

The project intends to retain the historic streetlights in their current locations during construction and protect them from inadvertent damage (e.g., resulting from construction equipment or construction-related vibration). Following the completion of construction, the widened roadway would not be anticipated to represent a perceptible change from ground level. Visual simulations of the proposed changes to the Wescoat Road streetscape shown in Figures 2 and 3 in Appendix 3.2-1, *Aesthetics and Visual Resources CEQA Evaluation*, of this joint EIR/EIS. The streetlights would continue to convey the symmetrical layout and regular spacing along Wescoat Road that reinforce the formal landscape character of the historic district. However, further details on the methods that would be used to protect the contributing streetlights have not yet been developed. Therefore, it remains possible that the streetlights would not be protected adequately during project construction. Were the streetlights to be damaged, the pattern of streetlights in the NAS Sunnyvale Historic District would no longer reinforce the formal landscape character of the historic district.

Vibration-Related Damage

Construction in the vicinity of individual historical resources and historic district contributors appears to have the potential to cause vibration at levels exceeding applicable damage criteria

outlined by the California Department of Transportation. As described in Section 3.12, *Noise*, of this joint EIR/EIS, groundborne vibration generated by construction activities would exceed the Caltrans damage threshold for "historic and some old buildings" (i.e., peak particle velocity [PPV] of 0.25 inch per second [in/sec]) where vibratory rollers would be used for soil compaction or in-street utility work within 22 feet of such resources.

Based on currently available information, the use of vibratory rollers is the most vibration-intensive construction activity that may be employed to construct the CEQA Proposed Project. This construction method within the Cummins Avenue roadway may take place less than 20 feet from Hangar One's southwest corner, and similar work occurring in Wescoat Road could be as close as 22 feet from Building 6 and Building 16, which are contributors to the NAS Sunnyvale Historic District. Using a conservative analysis, at the aforementioned distances, it is possible that Hangar One, Building 6, and Building 16 could experience construction-related vibration that would be above the damage threshold for "historic and some old buildings" (PPV of 0.25 in/sec).[42] Therefore, it is possible that the use of vibratory rollers for in-street utility work in Wescoat Road and Cummins Avenue could cause damage to character-defining physical characteristics of nearby historical resources.

Changes in Setting

In addition to the project's potential to remove or damage contributing elements of the NAS Sunnyvale Historic District, the project proposes to construct new buildings adjacent to the southern boundary of the NAS Sunnyvale Historic District and in the vicinity of Hangar One. The project would replace the buildings currently located in the Project Site—which are generally one to two stories tall and surrounded by surface parking lots—with approximately 2.3 million square feet of new academic and research facilities. The proposed facilities would be housed in buildings that would reach a maximum height of 105 feet (i.e., a maximum building height of 80 feet plus a 25-foot allowance for mechanical equipment and screens). The facilities have been designed at a conceptual level and include stepdown zones along Wescoat Road and Cody Road, across which the Project Site faces the expanded NAS Sunnyvale Historic District. The stepdown zones propose a 15-foot stepback for the portions of the new buildings above 35 feet tall.

During the period of significance for the expanded NAS Sunnyvale Historic District (1930–1961), the Project Site contained a collection of low-scaled, one- and two-story military support buildings, such as lodging and recreational facilities. Although some buildings in the Project Site date to the period of significance, the current conditions of the Project Site do not appear to be important elements in the setting of Hangar One, Hangar Two, or the larger NAS Sunnyvale Historic District. The demolition of the industrial and institutional buildings currently in the Project Site would not remove any features that allow the historic district to convey its historically significant military missions. However, the scale of the new buildings constructed by the project would represent a visible increase compared to the buildings now located in the Project Site, and the proposed scale

[42] The California Department of Transportation's *Transportation and Construction Vibration Guidance Manual* does not provide definitions for the property categories for which it establishes damage thresholds. The available categories include extremely fragile historic buildings, fragile buildings, historic and some old buildings, older residential structures, new residential structures, and modern industrial/commercial buildings. The noise and vibration analysis completed for this investigation has conservatively assigned the contributors to the NAS Sunnyvale Historic District to the category historic and some old buildings. (California Department of Transportation. 2020. *Transportation and Construction Vibration Guidance Manual*. April 2020. Page 38.)

and pattern of development would change the setting of historical resources (particularly Hangar One and the expanded NAS Sunnyvale Historic District).

If built up to the maximum development parameters, the new buildings constructed under the project would be visible from areas inside the historic district. Assessing whether views of the new development from the historic district would result in an impact to the historic district requires an understanding of the NAS Sunnyvale Historic District's most important visual relationships. Previous investigations have considered visual relationships within the NAS Sunnyvale Historic District and have identified the following views as character-defining qualities of the historic district:

- Broad, open views across aviation areas
- Long views to the salt ponds and San Francisco Bay
- Visual dominance of Hangar One from all areas, including from the main entrance gate at Moffett Boulevard, from Hangar Two, and from the airfield
- Views to aircraft maintenance Hangar Two[43]

Visual simulations indicate that the CEQA Proposed Project would not interrupt these visual relationships. New buildings would be visible from vantage points surrounding the airfield, including the view west from Hangar Two, but would remain subordinate volumes compared to Hangar One.

Visual simulations shown in Figures 10, 11, and 12 in Appendix 3.2-1, *Aesthetics and Visual Resources CEQA Evaluation*, of this joint EIR/EIS illustrate that the CEQA Proposed Project would not obstruct views across the airfield, including toward Hangar One. The hangar would be approximately twice as tall as the maximum height of the buildings with mechanical screens proposed by the project (105 feet), and Hangar One would be obscured only from vantage points south and southwest of Hangar One. Although these view corridors allow members of the public to see the hangar from areas outside of NASA ARC, such as along U.S. 101, they are not historically significant visual relationships.

The CEQA Proposed Project would also be visible from the Shenandoah Plaza open space, which follows the primary east–west axis from the entrance at Moffett Federal Airfield toward Hangar One. As depicted in Figure 6 in Appendix 3.2-1, the proposed buildings are anticipated to be obscured by intervening mature trees and existing buildings when viewed facing east toward Hangar One from the west end of Shenandoah Plaza. Figures 7, 8, and 9 in Appendix 3.2-1 indicate that the upper stories and mechanical screens of the proposed buildings would be more likely to be visible nearer Hangar One, such as in front of Building 17, because their 105-foot maximum height, including the 25-foot maximum height for the mechanical screens, surpassing the two-story buildings that line Shenandoah Plaza to the south.

The change in setting would also be apparent along Wescoat Road and Cody Road, which form the northern and western boundaries of the historic district, respectively. (Refer to Figures 2 through 5 in Appendix 3.2-1 for simulated views of the changed setting along Wescoat Road and Cody Road.) Along these corridors, new buildings proposed by the project would rise taller than the low-scaled buildings currently in the Project Site. The nearest district contributors along Wescoat Road stand

[43] AECOM. 2013. *Historic Property Survey Report for the Airfield at NASA Ames Research Center*. Prepared for NASA Ames Research Center. Pages 4-3, 5-4 through 5-6.

within 100 feet of the Project Site and are typically one or two stories tall, which is perceptibly lower than the maximum development parameter proposed by the project. The 15-foot stepback above a height of 35 feet would somewhat mediate the change in building scale across Wescoat Road between the Project Site and the NAS Sunnyvale Historic District, but the building masses would remain clearly visible from the historic district. Along Cody Road, Building 158 (the Flight Operations Building) is the primary district contributor that faces the Project Site, but it is separated from the Project Site by more distance (more than 300 feet). Furthermore, Building 158 maintains a close functional and visual relationship with the airfield, which is located adjacent to its east side; the CEQA Proposed Project would not interrupt that relationship.

Although the project would not obscure the most important views within the NAS Sunnyvale Historic District, it would still introduce large building masses into the historic district's setting where none existed previously. The project design remains at a conceptual stage, and the architectural character of new buildings in the Project Site has not yet been developed. However, as shown in Table 2-4 in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, the following proposed Standards in the Development Guidelines are intended to promote architectural compatibility with the historic district:[44]

- The architectural character of Berkeley Space Center shall reflect its own time and the unique purposes of the research buildings, conveying a keen sense of place and identity, both for the immediate Berkeley Space Center area and within the broader NASA ARC, complementing the historic buildings and avoiding simulacrum.
- Architectural character shall both complement the historic character of Shenandoah Plaza and provide a contemporary response to the new development as an urban research district. Façades shall be articulated to convey a sense of human scale, denote building entries and reinforce the design of the streetwall.

The intention of the Standards is to support the architectural compatibility of new development in relation to the NAS Sunnyvale Historic District, consequently lessening the impact of the project's scale and visual bulk. However, the design of the CEQA Proposed Project has not been developed to the extent that it can be demonstrated whether project-specific interpretation of the Standards will successfully achieve architectural compatibility with the historic district. Even with an architecturally compatible design, the CEQA Proposed Project design would introduce visually distracting and out-of-scale facilities into the immediate setting of the historic district, where the setting has historically been characterized by rural or low-density institutional development. Therefore, construction of the proposed project would change aspects of the historic district's setting that help convey its historical development between the 1930s and 1960s.

In addition to new building masses, the proposed project envisions landscape treatments along Wescoat Road and Cody Road, which run along the boundaries of the historic district. Currently, the streetscape at these roadways is characterized by a graded, level ground surface with areas of grass turf interspersed with paved parking lots and automobile access drives. West of Dailey Road, both sides of Wescoat Road feature grass turf approaching the roadway curb. Segments of concrete strip sidewalks are also present in some areas. There are several mature trees in the vicinity of Wescoat Road, which establish an inconsistent canopy along the roadway. East of Dailey Road, the landscape character of Wescoat Road is more utilitarian and features fewer trees and intact sidewalks. The

[44] The proposed Development Guidelines refer to the Shenandoah Plaza Historic District and the NAS Sunnyvale Historic District interchangeably.

Cody Road corridor does not appear to have any formally designed landscape features and generally contributes to the utilitarian visual qualities of the adjacent airfield to the east.

The proposed Master Plan and Development Guidelines envision a landscape treatment for the south side of Wescoat Road (located within the Project Site) that comprises regularly spaced street trees within a 6-foot-wide amenity band, as well as an 8.5-foot-wide sidewalk. The treatment for the west side of Cody Road is similar although proposes a slightly wider (9-foot) sidewalk and an additional planting area containing trees and low plantings. As shown in Figure 2-5, *Conceptual Site Plan for the CEQA Proposed Project and CEQA Reduced Density Alternative,* in Chapter 2, Proposed Project/Proposed Action and Alternatives, of this joint EIR/EIS, the conceptual site plan includes two open spaces, the Gateway Plaza and Hangar Commons, that would partially face Wescoat Road and/or Cody Road. Gateway Plaza would be located near the west end of the Project Site near the Girard Connector, and Hangar Commons would occupy the northeast corner of the Project Site at the intersection of Wescoat Road and Cody Road. Both open spaces would contain regional plantings belonging to woodlands and gardens and meadows planting typologies.

The introduction of rows of regularly spaced street trees along Wescoat Road and Cody Road would reinforce the existing green qualities of the NAS Sunnyvale Historic District and would help define the district's boundaries, in addition to somewhat mediating the change in building scale between the Project Site and the historic district. The presence of the street trees, however, would not screen the visual mass of new facilities to the extent necessary to lessen the proposed project's impact on the setting of the historic district. The proposed street trees and pedestrian circulation along Wescoat Road and Cody Road would be identifiable as contemporary treatments within the Project Site that are compatible with the existing, green landscape character of Shenandoah Plaza. More dense and variegated plantings in the two open spaces along Wescoat Road and Cody Road may be partially visible from vantage points along the edge of the historic district, but they would similarly support the overall natural qualities of the larger site while remaining identifiable as modern landscape elements.

For these reasons, the landscape treatments in the proposed Master Plan and Development Guidelines would not contribute to the significant impact on the historic setting of the NAS Sunnyvale Historic District.

Conclusion

As demonstrated in the preceding discussion, the CEQA Proposed Project may result in physical damage (associated with vibration) to contributors to the NAS Sunnyvale Historic District, and new development would introduce new facilities into the setting of the NAS Sunnyvale Historic District that materially impair the district's significance. Therefore, impacts on built-environment historical resources would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure CUL-1. Protect Shenandoah Plaza Streetlights

Prior to the issuance of permits for work occurring in the Clark Road, Wescoat Road, and Cummins Avenue roadways, the Project Proponent shall submit site plans for review and approval by the NASA ARC cultural resources manager to ensure that historic streetlights are retained in their current locations at the conclusion of project construction. This measure

applies to the 17 streetlights installed during the 1930s that line Clark Road, Wescoat Road, and Cummins Avenue. The Project Proponent shall also incorporate into contract specifications a requirement that the contractor(s) prepare a written protection plan that outlines the methods and equipment to be used so that equipment- and vibration-related damage to the streetlights is avoided during construction. Such methods may include staging equipment and materials so as to avoid direct damage, installing physical barriers, and temporarily stabilizing the area, as deemed appropriate by the contractor. Specifications shall also stipulate that any damage incurred to historic properties as a result of construction activities shall be reported to the NASA ARC cultural resources manager. The site plans and contract specifications shall be reviewed and deemed adequate by the NASA ARC cultural resources manager prior to the issuance of permits.

If damage to a streetlight occurs during construction, the Project Proponent shall engage a qualified professional who meets the standards for historical architecture, as set forth by the Secretary of the Interior's Professional Qualification Standards (36 Code of Federal Regulations, Part 61), to assess the damage and provide treatment recommendations. Damage incurred to the resource shall be repaired according to the Secretary of the Interior's Standards in consultation with the qualified professional and NASA ARC cultural resources manager.

Mitigation Measure CUL-2. Review Project Design for Architectural Compatibility

To ensure the designs of project buildings adjacent to the NAS Sunnyvale Historic District (i.e., along Wescoat Road and Cody Road) are informed by the Secretary of the Interior's Standards, the Project Proponent shall retain a qualified professional to consult on and evaluate project construction plans at conceptual design, schematic design, and permit submittal phases. The purpose of this mitigation measure is to promote architectural compatibility between project buildings and the historic district, on balance with appropriate differentiation. This mitigation measure establishes a review process that applies only to exterior building façades that are most immediately visible from the historic district (i.e., the northernmost 150 feet of Subareas 1, 2, and 6, as well as the easternmost 150 feet of Subarea 3). The qualified professional shall meet the Secretary of the Interior's Professional Qualifications Standards (36 CFR Part 61) for architectural history or historic architecture.

In coordination with the Schematic Design Review process required by the NASA Research Park (NRP) Design Review Board (pursuant to Ames Procedural Requirement 8822.1), the qualified professional shall provide input during the development of the conceptual design of exteriors of project buildings in Subareas along Wescoat Road and Cody Road (adjacent to the NAS Sunnyvale Historic District) using the Secretary of the Interior's Standards (particularly Standard 9). Input on the exteriors of project buildings may relate to massing, fenestration patterns, entry placement, exterior materials, and façade articulation. Following completion of conceptual design, the qualified professional shall prepare a memorandum that analyzes the compatibility of project building design elements that have been developed. If the design of project buildings does not comply with the Secretary of the Interior's Standards, the qualified professional shall provide recommendations for modifying the project building design to improve its compatibility with the historic district. The memorandum shall be included in the Conceptual Design Phase submittal, and the NASA ARC cultural resources manager shall review and provide comments on the analysis during the Conceptual Design Review process. The Project Proponent shall incorporate the recommended design changes that are feasible while also meeting the objectives of the project (i.e., do not conflict with code requirements or

remove programmatically necessary amenities). The Project Proponent shall provide a response documenting the reasons any recommendations are not feasible and cannot be incorporated into the project design.

The qualified professional shall prepare memoranda that document and analyze the schematic design and permit submittal documents to address any subsequent design changes with the potential to cause visual effects on the NAS Sunnyvale Historic District that occurred from previous review. Each analysis shall be submitted to the Project Proponent and NASA ARC cultural resources manager. Should NASA ARC disagree with any conclusions in the analysis, they shall notify the Project Proponent within 2 weeks of NASA's receipt of the memo of proposed design changes. The plans shall not be resubmitted, but those changes shall be incorporated into the next plan submission. Prior to the issuance of a building permit, NASA cultural resources staff must sign-off that the final permitted plans have been developed with the greatest possible adherence to the objectives defined in the design review process while also meeting project objectives. NASA shall notify ARC Center Consulting Parties under the NASA-Wide Programmatic Agreement, as appropriate, of the approval of construction documents and shall distribute the approved memorandum to demonstrate compliance with this measure.

Mitigation Measure CUL-3. Develop and Implement an Interpretive Program

The Project Proponent shall develop and implement an interpretive program that documents and commemorates the historical development and setting of the NAS Sunnyvale Historic District. Interpretive materials shall address the general history of NAS Sunnyvale and incorporate visual representations of the installation's historical setting (including the Project Site) during the interwar, World War II, and early Cold War periods. Interpretive media may include on-site displays placed in visible and accessible locations and/or digital platforms (i.e., using a mobile device application).

An interpretive plan shall be prepared in coordination with an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards and an exhibit designer, graphic designer, and/or other professional with historical interpretation design experience. The interpretive plan shall describe, at a minimum, the proposed location(s), formats/media, and content themes of interpretive materials. The NASA ARC cultural resources manager shall advise on whether the interpretive plan shall be developed in coordination with separate interpretive requirements (i.e., public interpretation of archaeological materials required by the Cultural Resources Treatment and Monitoring Plan). Representatives from the Moffett Field Museum shall be invited to collaborate on the interpretive plan to ensure that proposed materials and themes are coordinated with existing or planned interpretive efforts at NASA ARC. The interpretive plan shall be reviewed and approved by the NASA ARC cultural resources manager.

Following approval of the interpretive plan, the qualified historian and designer shall then develop detailed interpretive content, including text and images, and applicable design specifications for the interpretive materials. The NASA ARC cultural resources manager shall review and approve the text, images, and applicable design specifications prior to production and installation or publication of the interpretive materials and prior to the completion of the first construction phase.

Mitigation Measure NOI-5. Construction Vibration Control Plan for Vibratory Rollers

See discussion for the CEQA Proposed Project under Impact CEQA-NOI-2 in Section 3.12, *Noise*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure CUL-1 would ensure that contributing streetlights are protected during construction and able to continue to express the NAS Sunnyvale Historic District's original landscape qualities. Mitigation Measure NOI-5 would furthermore protect historical resources near vibration-producing construction activities. Mitigation Measure CUL-2 would establish a process through which the proposed project design is developed to be as architecturally compatible with the NAS Sunnyvale Historic District as feasible while also meeting project objectives. However, it cannot be guaranteed that Mitigation Measure CUL-2 would successfully prevent material impairment to the NAS Sunnyvale Historic District's setting. Mitigation Measure CUL-3 would require the development of interpretive materials that document the historic district's physical development and setting. However, there is no feasible mitigation beyond these measures to prevent material impairment of the historic district's setting. Therefore, the impact on built-environment resources would remain significant and unavoidable with the implementation of mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

Because the CEQA Proposed Project No Student/Faculty Housing Variant would include the same site plan, maximum building height, and roadway infrastructure as the CEQA Proposed Project, potential impacts related to historical resources would be the same as under the CEQA Proposed Project. Therefore, impacts on built-environment historical resources would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure CUL-1. Protect Shenandoah Plaza Streetlights

Mitigation Measure CUL-2. Review Project Design for Architectural Compatibility

Mitigation Measure CUL-3. Develop and Implement an Interpretive Program

See discussion for CEQA Proposed Project under Impact CEQA-CUL-1.

Mitigation Measure NOI-5. Construction Vibration Control Plan for Vibratory Rollers

See discussion for the CEQA Proposed Project under Impact CEQA-NOI-2 in Section 3.12, *Noise*, of this joint EIR/EIS.

Significance After Mitigation

Implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, and NOI-5 would reduce impacts to the extent feasible. Even with implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, and NOI-5, the impact on built-environment historical resources under the CEQA Proposed Project with the Variant would remain significant and unavoidable.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Because the CEQA Reduced Density Alternative would include the same site plan, maximum building height, and roadway infrastructure as the CEQA Proposed Project, potential impacts related to historical resources would be the same as under the CEQA Proposed Project. Therefore, impacts on built-environment historical resources would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure CUL-1. Protect Shenandoah Plaza Streetlights

Mitigation Measure CUL-2. Review Project Design for Architectural Compatibility

Mitigation Measure CUL-3. Develop and Implement an Interpretive Program

See discussion for CEQA Proposed Project under Impact CEQA-CUL-1.

Mitigation Measure NOI-5. Construction Vibration Control Plan for Vibratory Rollers

See discussion for the CEQA Proposed Project under Impact CEQA-NOI-2 in Section 3.12, *Noise*, of this joint EIR/EIS.

Significance After Mitigation

Implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, and NOI-5 would reduce impacts to the extent feasible. Even with implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, and NOI-5, the impact on built-environment historical resources under the CEQA Reduced Density Alternative would remain significant and unavoidable.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

Because the CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include the same site plan, maximum building height, and roadway infrastructure as the CEQA Proposed Project, potential impacts related to historical resources would be the same as under the CEQA Proposed Project. Therefore, impacts on built-environment historical resources would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure CUL-1. Protect Shenandoah Plaza Streetlights

Mitigation Measure CUL-2. Review Project Design for Architectural Compatibility

Mitigation Measure CUL-3. Develop and Implement an Interpretive Program

See discussion for the CEQA Proposed Project under Impact CEQA-CUL-1.

Mitigation Measure NOI-5. Construction Vibration Control Plan for Vibratory Rollers

See discussion for the CEQA Proposed Project under Impact CEQA-NOI-2 in Section 3.12, *Noise*, of this joint EIR/EIS.

Significance After Mitigation

Implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, and NOI-5 would reduce impacts to the extent feasible. Even with implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, and NOI-5, the impact on built-environment historical resources under the CEQA Reduced Density Alternative with the Variant would remain significant and unavoidable.

Impact CEQA-CUL-2: Would the project cause a substantial adverse change in the significance of an archaeological historical resource pursuant to Section 15064.5 or a unique archaeological resource (PRC Section 21083.2)?

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	CUL-4. Cultural Resources Treatment and Monitoring Plan CUL-5. Cultural Resources Monitoring and Sensitivity Training CUL-6. Cultural Resources Inadvertent Discoveries Protocols	Significant and Unavoidable with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Significant and Unavoidable with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

The CEQA Proposed Project would result in a significant impact if it were to disturb, damage, or degrade an archaeological resource or its setting in a manner that would materially impair the significance of the resource pursuant to Section 15064.5 of the State CEQA Guidelines. The APE and ADI have a history of intensive precontact and historic-period use and physical remnants from these former uses still exist within the APE and ADI. Therefore, the CEQA Proposed Project's grading and excavation may substantially disturb, damage, or degrade archaeological resources. As a result, construction may cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5.

Appendix A: Figure A-37 in the Cultural Resource Inventory Report identifies the CEQA Proposed Project elements affecting the two archaeological sites identified within the Project Site, treated here as eligible. Project elements affecting CA-SCL-1145 include excavations for building foundations

(depth of impact is 5 feet) and open space and landscaping (depth of impact is up to 4 feet). Resource CA-SCL-1146 is mapped in areas affected by open space and landscaping activities (depth of impact up to 4 feet). The archaeological sensitivity assessment shows that the CEQA Proposed Project also has a high sensitivity for previously unidentified precontact and historic-era archaeological sites within the ADI (Appendix A: Figures A-34 and A-35 in the Cultural Resource Inventory Report), and data from known sites indicate that deposits associated with any unidentified sites could exist at depths as shallow as the top 60 centimeters (2 feet) below surface.

The impacts of the CEQA Proposed Project within the Project Site extending up to 5 feet in depth would very likely result in partial or complete destruction of the subsurface deposits, which are treated here as eligible. Therefore, impacts on archaeological resources would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the Authority Having Jurisdiction (AHJ), NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural resources and archaeological resources. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-4. Cultural Resources Treatment and Monitoring Plan

Prior to any ground-disturbing activity, the Project Proponent shall retain a qualified Archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (qualified Archaeologist) to develop a Cultural Resources Treatment and Monitoring Plan (CRTMP) in consultation with the Project Proponent, NASA, and ARC Center Consulting Parties under the NASA-Wide Programmatic Agreement, as appropriate. The CRTMP shall specify the procedures to be used to implement the mitigation measures or conditions of approval in the field, the standards of evaluation for unanticipated discoveries that shall be appropriate given the locations and kinds of cultural properties predicted, and treatment methods for resources determined eligible for the National Register of Historic Places (NRHP). The CRTMP shall meet the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (U.S. Department of the Interior, National Park Service, 1983, as amended and annotated). Within each construction phase, all actions mandated in the CRTMP shall be implemented after demolition, but before any other ground-disturbing activities (e.g., grading, trenching), except for the activities as noted below. The CRTMP shall include descriptions and/or summaries of:

- The proposed project and its subsurface impacts;
- The proposed project's regulatory requirements;
- Known cultural resources in the APE and ADI;
- Canine Forensic Survey Alert Results and Interpretations;

- Archaeological Site Sensitivity Assessments;
- A Monitoring Plan that includes:
    - A definition of the Cultural Resources Monitoring Area (CRMA)
    - Requirements for cultural resources sensitivity training
    - Requirements for tribal resources sensitivity training, monitoring schedules, consultation requirements, procedures for addressing tribal resource discoveries made during construction, documentation requirements
    - Monitoring schedules
    - Procedures for addressing archaeological discoveries made during construction
    - Documentation requirements, etc.
- A tribal ethnographic study for each consulting tribe developed in partnership with the tribes that incorporates tribal realities (to be completed prior to occupancy of Phase 4);
- Public interpretation, as determined through consultation with ARC Center Consulting Parties, as appropriate, and designed as part of the interpretive program (see above) (to be completed prior to occupancy of Phase 4);
- Protocols for the treatment of isolate artifacts;
- A plan for conducting subsurface archaeological assessment/evaluation of a sample of the archaeologically sensitive areas and Canine Forensic Survey Alert locations, with sample locations focused on areas of clustered Canine Forensic Survey Alerts and/or areas where the archaeological sensitivity overlaps with the Canine Forensic Survey Alert results. The sample testing locations shall be determined through continued consultation with ARC Center Consulting Parties, as appropriate. The plan shall include subsurface testing through a combination of non-invasive methods (e.g., ground-penetrating radar), mechanical trenching, and hand excavation to allow the qualified Archaeologist and tribal monitor to observe subsurface conditions and locate any buried cultural deposits, features, or artifacts. If the subsurface investigation identifies archaeological resources, the Archaeologist shall conduct hand excavation to evaluate the find to recommend its eligibility under the National Historic Preservation Act (NHPA) Section 106 (36 CFR Part 800). The plan shall include research themes and eligibility criteria to guide the evaluation of archaeological resources under the NRHP. The qualified Archaeologist shall document any findings and subsurface conditions in a report that shall be submitted to NASA. The draft technical report shall be shared with the SHPO and ARC Center Consulting Parties, as appropriate, for review and comment. This plan shall be developed and implemented after demolition, but prior to any other ground-disturbing activity (e.g., grading, trenching) for each construction phase.
- A plan for documenting the data potential and integrity of CA-SCL-1145 and CA-SCL-1146. The plan shall include subsurface testing through a combination of non-invasive methods (e.g., ground-penetrating radar), mechanical trenching, and hand excavation to allow the qualified Archaeologist and Native American monitor to observe subsurface conditions and locate any buried cultural deposits, features, or artifacts. The project shall develop and implement treatments commensurate with the data potential and integrity of archaeological resources CA-SCL-1145 and CA-SCL-1146, and any additional NRHP eligible resources

identified through the subsurface archaeological assessment/evaluation (see above), which shall include data recovery guided by a data recovery plan; the amount of data recovery may be scaled based on the integrity of the resources. The data recovery plan shall include controlled subsurface excavations at archaeological resources CA-SCL-1145 and CA-SCL-1146, archival research, and detailed analysis of artifacts and organic remains recovered during excavation, per protocols outlined in this CRTMP. The qualified Archaeologist shall document the findings and subsurface conditions in a data recovery report, which would be submitted to NASA. The draft data recovery report shall be shared with the SHPO and ARC Center Consulting Parties, as appropriate, for review and comment. The final data recovery report shall be submitted to Northwest Information Center (NWIC) and ARC Center Consulting Parties under the NASA-Wide Programmatic Agreement, as appropriate. This plan shall be developed and implemented after demolition, but prior to any other ground-disturbing activity (e.g., grading, trenching) that includes archaeological resources CA-SCL-1145 and CA-SCL-1146.

- If currently unknown NRHP eligible resources are present, treatment plans to reduce project impacts to eligible resources to less than significant/minimize or offset adverse effects, including:
    - Where feasible, protect sites or portions of sites identified during subsurface testing (e.g., incorporating sites within proposed project open space, re-routing proposed project underground infrastructure, covering the archaeological sites with a layer of chemically stable soil before building impervious surface improvements) (to be completed prior to the start of each construction phase); and/or
    - Archaeological Data Recovery (post-field activities to be completed prior to occupancy of Phase 4); and/or
    - Public Interpretation (to be completed prior to occupancy of Phase 4).
- Curation and/or reburial requirements for non-human remains and non-funerary objects (to be completed prior to occupancy of Phase 4);
- Reporting requirements (to be completed prior to occupancy of Phase 4); and
- Conflict resolution (to be completed prior to occupancy of Phase 4).

Mitigation Measure CUL-5. Cultural Resources Monitoring and Sensitivity Training

The qualified Archaeologist shall oversee an archaeological monitor who shall be present during ground disturbing activities (e.g., demolition activities that involve ground disturbance, clearing/grubbing, grading, trenching) within the Cultural Resources Monitoring Area (CRMA), as defined the CRTMP. Native American tribal representatives from the Costanoan Rumsen Carmel Tribe, Muwekma Ohlone of the San Francisco Bay Area, and Tamien Nation shall also monitor ground disturbing activities in the CRMA on a rotating basis. Tribal monitoring shall also be required for all archaeological testing and data recovery. In addition, cultural resources sensitivity training shall be pre-recorded for presentation to all construction personnel. The training shall be prepared by the qualified Archaeologist and representatives from the Native American tribes, focusing on how to identify cultural resources that may be encountered during earthmoving activities and the procedures to be followed in such an event. The pre-recorded training materials and a sign-in sheet from the training shall be provided to the Project Proponent to ensure compliance with this mitigation measure. The qualified Archaeologist shall

prepare a monitoring report at the conclusion of archaeological monitoring. Tribal representatives from the Costanoan Rumsen Carmel Tribe, Muwekma Ohlone of the San Francisco Bay Area, and Tamien Nation shall review and provide comments on the monitoring report. The final monitoring report shall be submitted to Northwest Information Center (NWIC) and participating Native American communities. The monitoring program and report shall be completed prior to occupancy of Phase 4.

Mitigation Measure CUL-6. Cultural Resources Inadvertent Discoveries Protocols

In the event that unforeseen precontact (e.g., hearths, stone tools, shell and faunal bone remains, etc.) or historic-era (e.g., bottles, foundations, refuse dumps/privies, etc.) archaeological resources are unearthed, ground-disturbing activities within 100-foot radius of the discovery shall be halted or diverted. Work shall be allowed to continue outside of the 100-foot buffer area. All archaeological resources unearthed by project construction activities shall be evaluated by a qualified Archaeologist, in consultation with tribal representatives from the Costanoan Rumsen Carmel Tribe, Muwekma Ohlone of the San Francisco Bay Area, and Tamien Nation, using methods outlined in the CRTMP. If a resource is determined by NASA, in consultation with the qualified Archaeologist and the tribes, to constitute a "historic property" pursuant to Section 106 of the NHPA, the qualified Archaeologist, in consultation with the tribes, shall direct implementation of mitigation using methods outlined in the CRTMP. Proper treatment of all inadvertent discoveries, per the CRTMP, shall be completed before occupancy of Phase 4 of the proposed project.

Significance After Mitigation

Mitigation Measures CUL-4, CUL-5, and CUL-6 would require preparation and implementation of a CRTMP, cultural resources monitoring and sensitivity training, and protocols for inadvertent discoveries of archaeological resources. Implementation of Mitigation Measures CUL-4, CUL-5, and CUL-6 would reduce impacts to known archaeological resources (CA-SCL-1145 and CA-SCL-1146) and currently unknown archaeological resources. As discussed above, there are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural resources and archaeological resources. Specifically, there are archaeological resources that could be eligible under CRHR but are not eligible under NRHP and NASA may not determine those resources to be significant. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on archaeological resources would remain significant and unavoidable with the implementation of mitigation. Any adverse effects to TCPs would be resolved through the Section 106 process, as discussed in Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS. Potential impacts to archaeological resources treated as TCRs are evaluated in Section 3.17, *Tribal Cultural Resources*.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

Because the CEQA Proposed Project No Student/Faculty Housing Variant's construction would include the same ground disturbance and excavation as the CEQA Proposed Project, potential impacts related to archaeological historical resources would be the same as under the CEQA Proposed Project. Therefore, impacts on archaeological resources would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the AHJ, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural resources and archaeological resources. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-4. Cultural Resources Treatment and Monitoring Plan

Mitigation Measure CUL-5. Cultural Resources Monitoring and Sensitivity Training

Mitigation Measure CUL-6. Cultural Resources Inadvertent Discoveries Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-CUL-2.

Significance After Mitigation

Mitigation Measures CUL-4, CUL-5, and CUL-6 would require preparation and implementation of a CRTMP, cultural resources monitoring and sensitivity training, and protocols for inadvertent discoveries of archaeological resources. Implementation of Mitigation Measures CUL-4, CUL-5, and CUL-6 would reduce impacts to known archaeological resources (CA-SCL-1145 and CA-SCL-1146) and currently unknown archaeological resources. As discussed above, there are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural resources and archaeological resources. Specifically, there are archaeological resources that could be eligible under CRHR but are not eligible under NRHP and NASA may not determine those resources to be significant. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on archaeological resources would remain significant and unavoidable with the implementation of mitigation. Any adverse effects to TCPs would be resolved through the Section 106 process, as discussed in Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS. Potential impacts to archaeological resources treated as TCRs are evaluated in Section 3.17, *Tribal Cultural Resources*.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Because the CEQA Reduced Density Alternative proposes the same land uses, site plan, and roadway infrastructure as the CEQA Proposed Project, the construction activities caused by new development would be the same. Therefore, impacts on archaeological resources would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the AHJ, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural

resources and archaeological resources. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-4. Cultural Resources Treatment and Monitoring Plan

Mitigation Measure CUL-5. Cultural Resources Monitoring and Sensitivity Training

Mitigation Measure CUL-6. Cultural Resources Inadvertent Discoveries Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-CUL-2.

Significance After Mitigation

Mitigation Measures CUL-4, CUL-5, and CUL-6 would require preparation and implementation of a CRTMP, cultural resources monitoring and sensitivity training, and protocols for inadvertent discoveries of archaeological resources. Implementation of Mitigation Measures CUL-4, CUL-5, and CUL-6 would reduce impacts to known archaeological resources (CA-SCL-1145 and CA-SCL-1146) and currently unknown archaeological resources. As discussed above, there are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural resources and archaeological resources. Specifically, there are archaeological resources that could be eligible under CRHR but are not eligible under NRHP and NASA may not determine those resources to be significant. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on archaeological resources would remain significant and unavoidable with the implementation of mitigation. Any adverse effects to TCPs would be resolved through the Section 106 process, as discussed in Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS. Potential impacts to archaeological resources treated as TCRs are evaluated in Section 3.17, *Tribal Cultural Resources*.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

Because the CEQA Reduced Density Alternative No Student/Faculty Housing Variant proposes the same land uses, site plan, and roadway infrastructure as the CEQA Reduced Density Alternative without the variant, the construction activities caused by new development would be the same. Therefore, impacts on archaeological resources would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the AHJ, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural resources and archaeological resources. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-4. Cultural Resources Treatment and Monitoring Plan

Mitigation Measure CUL-5. Cultural Resources Monitoring and Sensitivity Training

Mitigation Measure CUL-6. Cultural Resources Inadvertent Discoveries Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-CUL-2.

Significance After Mitigation

Mitigation Measures CUL-4, CUL-5, and CUL-6 would require preparation and implementation of a CRTMP, cultural resources monitoring and sensitivity training, and protocols for inadvertent discoveries of archaeological resources. Implementation of Mitigation Measures CUL-4, CUL-5, and CUL-6 would reduce impacts to known archaeological resources (CA-SCL-1145 and CA-SCL-1146) and currently unknown archaeological resources. As discussed above, there are differences between the evaluation of eligibility under the NRHP compared to the CRHR and associated mitigation protocols for cultural resources and archaeological resources. Specifically, there are archaeological resources that could be eligible under CRHR but are not eligible under NRHP and NASA may not determine those resources to be significant. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on archaeological resources would remain significant and unavoidable with the implementation of mitigation. Any adverse effects to TCPs would be resolved through the Section 106 process, as discussed in Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS. Potential impacts to archaeological resources treated as TCRs are evaluated in Section 3.17, *Tribal Cultural Resources*.

Impact CEQA-CUL-3: Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	CUL-7. Human Remains Discovery Protocols	Significant and Unavoidable with Mitigation
CEQA Proposed Project No Student/Faculty Housing Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Significant and Unavoidable with Mitigation
CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

The CEQA Proposed Project would have a significant impact if it were to disturb human remains, including those interred outside of dedicated cemeteries. The results of the records search from the

Northwest Information Center indicated that human remains have been recorded within the APE and ADI and within a 0.5-mile radius. Moreover, it is possible that original construction of the former and existing uses at the Project Site has displaced human remains or other types of cultural resources. Project grading and excavation may encounter and disturb human remains. Therefore, impacts on human remains would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the AHJ, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-7. Human Remains Discovery Protocols

If human remains are encountered unexpectedly during implementation of the proposed project at NASA ARC:

- NASA's Protective Services and ARC's Cultural Resources Manager shall be immediately notified.
- If it is determined that the human remains are recent, then the issue becomes a matter for law enforcement officials and there are no further cultural resource responsibilities.
- If it is determined that the human remains are archaeological in nature, NASA shall immediately notify the SHPO and ARC Center Consulting Parties under the NASA -Wide Programmatic Agreement, as appropriate, pursuant to approved inadvertent discovery mitigation.
- If it is determined that the human remains are of Native American origin, NASA shall initiate consultation with the appropriate Tribe(s) per the Native American Graves Protection and Repatriation Act, 43 CFR Part 10, which requires a draft plan of action. NASA and the Project Proponent shall assist the appropriate Tribe(s) to implement the plan of action, as necessary.

Significance After Mitigation

Mitigation Measure CUL-7 includes protocols for the discovery of previously unknown human remains in the event that they are encountered during construction. Implementation of Mitigation Measure CUL-7 would reduce impacts to human remains. As discussed above, there are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on human remains would remain significant and unavoidable with the implementation of mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

Because the CEQA Proposed Project No Student/Faculty Housing Variant's construction would include the same ground disturbance and excavation as the CEQA Proposed Project, potential impacts related to the disturbance of human remains would be the same as under the CEQA Proposed Project. Therefore, impacts on human remains would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the AHJ, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-7. Human Remains Discovery Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-CUL-3.

Significance After Mitigation

Mitigation Measure CUL-7 includes protocols for the discovery of previously unknown human remains in the event that they are encountered during construction. Implementation of Mitigation Measure CUL-7 would reduce impacts to human remains. As discussed above, there are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on human remains would remain significant and unavoidable with the implementation of mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Because the CEQA Reduced Density Alternative's construction would include the same ground disturbance and excavation as the CEQA Proposed Project, potential impacts related to the disturbance of human remains would be the same as under the CEQA Proposed Project. Therefore, impacts on human remains would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the AHJ, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act)

compared to state regulations and associated mitigation protocols for human remains. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-7. Human Remains Discovery Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-CUL-3.

Significance After Mitigation

Mitigation Measure CUL-7 includes protocols for the discovery of previously unknown human remains in the event that they are encountered during construction. Implementation of Mitigation Measure CUL-7 would reduce impacts to human remains. As discussed above, there are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on human remains would remain significant and unavoidable with the implementation of mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

Because the CEQA Reduced Density Alternative No Student/Faculty Housing Variant's construction would include the same ground disturbance and excavation as the CEQA Proposed Project, potential impacts related to the disturbance of human remains would be the same as under the CEQA Proposed Project. Therefore, impacts on human remains would be potentially significant before mitigation.

Mitigation Measures

Most of NASA ARC, including the area where the proposed project would be built and operated, is an area of exclusive federal jurisdiction. NASA is the NEPA Lead Agency for the proposed action and, as the AHJ, NASA would issue building permits and monitor applicable mitigation measures related to development and operation of the proposed project. There are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. The Project Site falls under NASA's jurisdiction, and UC Berkeley is not the AHJ. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction.

The following mitigation measure(s) are required:

Mitigation Measure CUL-7. Human Remains Discovery Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-CUL-3.

Significance After Mitigation

Mitigation Measure CUL-7 includes protocols for the discovery of previously unknown human remains in the event that they are encountered during construction. Implementation of Mitigation Measure CUL-7 would reduce impacts to human remains. As discussed above, there are differences between the

treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the impact on human remains would remain significant and unavoidable with the implementation of mitigation.

3.5.8 Cumulative Impacts

The discussion of cumulative impacts addresses the topics evaluated in the corresponding project impacts in Section 3.5.7, *Impacts and Mitigation Measures*, above. The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Impact Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. The cumulative geographic context for cultural resources is NASA ARC.

Impact CEQA-C-CUL-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to historical resources? (Significant and Unavoidable with Mitigation)

Cumulative projects at NASA ARC include other projects within the vicinity of Hangar One, Hangar Two, and the expanded NAS Sunnyvale Historic District. Cumulative projects include alterations to previously identified historic district contributors, including the reskinning of Hangar One, which installed an architecturally compatible cladding on Hangar One to replace original cladding panels that were removed in 2011; the demolition of Hangar Three, which removed a large historic district contributor on the east side of the airfield due to its structural deficiencies; and the rehabilitation of Building 19, Building 20, and Building 25, which are historic district contributors surrounding Shenandoah Plaza. Other cumulative projects include the construction of a 50,000-square-foot laboratory facility along Akron Road, within the boundary of the NAS Sunnyvale Historic District, as well as improvements and expansion of the Google Bus Fleet Maintenance Facility northeast of Hangar Two. Finally, the cumulative projects include the remaining developable area programmed in the NADP for the NRP that has not been allocated towards any current projects (as of 2025), which include approximately 340,345 square feet for historic district space; 21,945 square feet for educational uses; 114,710 square feet for Hangar One uses; 1,843,000 square feet for housing; and 12,000 square feet for public uses. The boundary of the NRP encompasses Shenandoah Plaza (within the NAS Sunnyvale Historic District), the Project Site, and an area to the south of the Project Site and north of U.S. 101.

The construction of the remaining developable area programmed in the NADP within the NRP has the potential to introduce new buildings within or near the boundary of the historic district. Although the specific locations and designs for these cumulative projects have not been defined, it remains possible that the cumulative projects could replace historic district contributors or could be built in areas of the historic district that are currently undeveloped (e.g., along the southern edge of Bushnell Road). New construction within the historic district may result in new buildings that are obvious intrusions and are not compatible with the historic scale and design qualities of Shenandoah Plaza.

It is also possible that a portion of the remaining developable area programmed in the NADP within the NRP could be built south of the Project Site. New construction in this location would not involve the demolition and replacement of historic district contributors. However, the new cumulative projects would be expected to alter the historic district's current setting, which is defined by low-

scale, utilitarian-style support buildings. The scale of any new construction has not been determined, but it may introduce a pattern of continuous development between the NAS Sunnyvale Historic District and U.S. 101. Historically characterized by a collection of low-scale buildings, this area could be developed with new buildings that are clearly visible along the western edge of the airfield and that contribute to the densification of the NAS Sunnyvale Historic District's open historic setting.

The impact of these cumulative projects on the setting of the expanded NAS Sunnyvale Historic District would also amplify the effect of Hangar Three's demolition, which removed the easternmost of two large aircraft hangars constructed on the east side of the airfield during World War II. Prior to the demolition of Hangar Three, the two eastern hangars provided visual balance with Hangar One and Shenandoah Plaza on the west side of the airfield. With the loss of Hangar Three and the construction of the remaining developable area programmed in the NADP within the NRP, the significant visual and spatial qualities that historically defined the historic district would be further diminished.

The project's cumulative impact on historical resources would be the same under the CEQA Proposed Project and CEQA Reduced Density Alternative, regardless of whether the Variant is implemented. Considered in combination with the cumulative projects, the proposed project would contribute to an ongoing diminishment of the NAS Sunnyvale Historic District's integrity. In summary, the proposed project in combination with cumulative projects would result in substantial adverse change to the setting of the expanded NAS Sunnyvale Historic District. Therefore, the impacts of the cumulative projects, combined with the proposed project, would result in a significant cumulative impact related to historical resources.

As described under Impact CEQA-CUL-1, implementation of Mitigation Measure CUL-2 would improve the proposed project's architectural compatibility with the contributors to the NAS Sunnyvale Historic District. Mitigation Measure CUL-2 would be expected to somewhat reduce the proposed project's visual impact on the historic district's setting but would not reduce the setting impact to a less-than-significant level. Mitigation Measure CUL-3 has been identified to document and share information on the historical development and setting of the NAS Sunnyvale Historic District but would not be able to avoid the change in the district's setting. Therefore, even with implementation of all feasible mitigation measures, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to significant environmental impacts on built-environment historical resources.

Impact CEQA C-CUL-2: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to archaeological resources and human remains? (Significant and Unavoidable with Mitigation)

Cumulative projects within the vicinity of the APE and ADI would include construction excavations at parcels that have been developed historically. Therefore, there is potential to affect significant archaeological resources that qualify as historical resources or unique archaeological resources, along with human remains. Moreover, other related projects performing similar construction excavations on parcels with a similar land use history could constitute a cumulatively considerable impact. As with the proposed project, all cumulative projects would be required to implement best management practices, policy/regulatory requirements, and/or mitigation measures to ensure that project activities would not result in the inadvertent destruction of an archaeological resource and

that discovery procedures pertaining to human remains would be implemented. Nonetheless, cumulative impacts on archaeological resources and human remains are considered significant because the cumulative projects would most likely involve ground-disturbing activities that could uncover unknown archaeological resources and/or human remains, similar to the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant). Therefore, the impacts of the cumulative projects, combined with the proposed project, would result in a significant cumulative impact on archaeological resources and human remains.

The cumulative projects would undergo separate environmental review and, depending on the depth of exavation and sensitivity of respective sites, mitigation measures could be identified for projects that have the potential to cause significant impacts on undiscovered resources. Implementation of Mitigation Measures CUL-4, CUL-5, and CUL-6 would require preparation and implementation of a CRTMP, cultural resources monitoring and sensitivity training, and protocols for inadvertent discoveries of archaeological resources, thereby minimizing significant impacts on archaeological resources. However, because damage to archaeological resources is irrepaceable, past projects, the effects of other current projects, and the effects of probable future projects will have a significant unavoidable impact on known and potentially unknown archaeological resources. Implementation of Mitigation Measure CUL-7 includes protocols for the discovery of previously unknown human remains in the event that they are encountered during construction, thereby reducing significant impacts on human remains. There are differences between the treatment of human remains under federal regulations (Native American Graves Protection and Repatriation Act) compared to state regulations and associated mitigation protocols for human remains. NASA, as the AHJ, makes the final determination as to all resources within its exclusive federal jurisdiction. Therefore, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would result in a cumulatively considerable contribution to significant environmental impacts on archaeological resources and human remains.

3.6 Energy

3.6.1 Introduction

This section evaluates the potential impacts on energy that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Project Site as well as the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical study prepared for the project:

- *Berkeley Space Center at NASA Research Park Air Quality, Health Risk Assessment*, and Greenhouse Gas Technical Report (Air Quality, Health Risk, and GHG Technical Report) prepared by ICF, April 2026 (Appendix 3.3-1 of this joint environmental impact report/environmental impact statement [EIR/EIS]).

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. The NOP/NOI comments pertaining to energy include a recommendation to design the proposed project to maximize renewable energy use and minimize the use of fossil fuels. This issue is addressed under Impact CEQA-ENE-1.

3.6.2 Affected Environment/Environmental Setting

Energy resources in the state include natural gas, electricity, water, wind, oil, coal, solar, geothermal, and nuclear. Both energy production and use can deplete nonrenewable resources, such as oil, natural gas, and coal, and result in emissions of pollutants. This section discusses the existing conditions related to energy statewide, regionally, and at the Project Site.

Regional Setting

State Energy Resources and Use

California's diverse portfolio of energy resources produced approximately 1,641.6 trillion British thermal units (BTU) in 2023.[1] According to the California Energy Commission (CEC), total electric generation for California in 2023 (the most recent year for which data are available) was approximately 281,140 gigawatt-hours. California's renewable and non-greenhouse gas (GHG) resources (i.e., nuclear and large hydroelectric) accounted for approximately 58 percent of total generation, compared to 54 percent in 2022. California's in-state electric generation was approximately 215,623 gigawatt-hours.[2] Excluding offshore areas, the state ranked seventh in the nation in crude oil production in 2023 (the most recent year for which data are available), producing

[1] U.S. Energy Information Administration. 2024. *Table P5B: Primary Energy Production Estimates, Renewable and Total Energy, in Trillion BTU, Ranked by State, 2023*. Available: https://www.eia.gov/state/seds/sep_prod/pdf/P5B.pdf. Accessed: August 21, 2025.

[2] California Energy Commission. 2025. *2023 Total System Electric Generation*. Available: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2023-total-system-electric-generation. Accessed: August 21, 2025.

the equivalent of approximately 673.2 trillion BTUs.[3] Other energy sources in the state include natural gas (148.9 trillion BTUs), nuclear (185.2 trillion BTUs), wood and waste (114.6 trillion BTUs), and biofuel (67.2 trillion BTUs).[4,5] No coal production occurs in California.

With a relatively mild Mediterranean climate and strict energy efficiency requirements, California has lower energy consumption rates than other parts of the United States. According to the U.S. Energy Information Administration, California consumed approximately 6,816.7 trillion BTUs of energy in 2023.[6,7] California's per-capita energy consumption of approximately 173.9 million BTUs was ranked second lowest in the nation as of 2023.[8]

In 2023, the transportation sector consumed the greatest amount of energy (3,035.7 trillion BTUs, or 45 percent), followed by the industrial (1,456.7 trillion BTUs, or 21 percent), residential (1,166.6 trillion BTUs, or 17 percent), and commercial (1,157.7 trillion BTUs, or 17 percent) sectors.[9] Natural gas accounted for the majority of energy consumption (2,154.5 trillion BTUs, or 30 percent), followed by gasoline (1,469.1 trillion BTUs, or 20 percent); renewable energy, including nuclear electric power, hydroelectric power, biomass, and other renewables (1,250.4 trillion BTUs, or 17 percent); distillates and jet fuel (1,069.3 trillion BTUs, or 15 percent); and interstate electricity (371.7 trillion BTUs, or 5 percent), with the remaining 13 percent coming from a variety of other sources.[10] Of the natural gas consumed, industrial uses consumed approximately 31 percent, followed by residential uses (22 percent) and commercial uses (12 percent), among many other uses.[11]

Per-capita energy consumption, in general, is declining because of improvements in energy efficiency and design. However, despite this reduction in per-capita energy use, the state's total

overall energy consumption (i.e., non–per-capita energy consumption) is expected to increase over the next several decades as a result of electrification in both buildings and vehicle travel.[12]

Regional Energy Resources and Use

Electricity

Pacific Gas and Electric Company (PG&E) provides electricity to Santa Clara County through its distribution system.[13] Historically, PG&E has provided natural gas and electricity services to the vast majority of Northern California, including Santa Clara County and the Project Site. PG&E is a publicly traded utility company that, under contract with the California Public Utilities Commission (CPUC), generates, purchases, and distributes energy. PG&E's service area covers 70,000 square miles, roughly extending north to south from Eureka to Bakersfield and east to west from the Sierra Nevada to the Pacific Ocean. PG&E's electricity distribution system consists of 106,681 circuit miles of electric distribution lines and 18,466 circuit miles of interconnected transmission lines.[14]

PG&E's electricity is generated from a combination of traditional sources, such as coal-fired plants, nuclear power plants, and hydroelectric dams, as well as newer sources of energy, such as wind turbines and photovoltaic plants, or solar farms. The grid, or bulk electric grid, is a network of high-voltage transmission lines that link power plants to the PG&E distribution system. The distribution system, comprising lower-voltage secondary lines, is at the street and neighborhood level. It consists of overhead or underground distribution lines, transformers, and individual service lines that connect to individual customers.

PG&E provides electricity to the National Aeronautics and Space Administration Ames Research Center (NASA ARC), including the Project Site. PG&E's power comes from a mix of various sources, including solar, wind, geothermal, biomass and biowaste, nuclear, and hydroelectric generation resources. The company allows customers to choose between four different electricity product operations: Base Plan, which contains a variety of energy resources as electricity, 50% Solar Choice, which contains at least 50 percent of electricity provided by solar resources, 100% Solar Choice, which contains 100 percent of electricity provided by solar resources, and Green Saver, which contains 100 percent of electricity provided by solar resources to income-qualified residential customers. As outlined in the Integrated Resource Plan, PG&E intends to achieve net-zero GHG emissions by 2040 and be climate positive by 2050, or, in other words, they intend to remove and/or reduce more GHGs than they emit.[15] Table 3.6-1 outlines PG&E's power mix in 2023 compared to the power mix for the state and identifies the renewable and nonrenewable energy sources for PG&E and the state. Some GHG-free sources are not considered renewable (e.g., nuclear is GHG-free but not renewable).

---

Electricity usage for different land uses varies substantially by the type of uses in a building, the type of construction materials used, and the efficiency of the electricity-consuming devices used. In 2023, Santa Clara County consumed approximately 16,690 gigawatt-hours of electricity. In Santa Clara County, electricity was consumed primarily by the nonresidential sector (75 percent), followed by the residential sector (25 percent).[16]

Table 3.6-1. PG&E and the State of California Power Mix in 2023

Energy Resources	PG&E Option: Base Plan	PG&E Option: 50% Solar Choice	PG&E Option: 100% Solar Choice	PG&E Option: Green Saver	2023 California Power Mix

Natural Gas

PG&E's natural gas (i.e., methane) delivery system includes 42,141 miles of natural gas distribution pipelines and 6,438 miles of transmission pipelines.[17] PG&E's gas transmission system is operated under an inspection and monitoring program in real time on a 24-hour basis, with leak inspections, surveys, and patrols continuously taking place along the pipelines. Gas delivered by PG&E originates in gas fields in California, the Southwest, the Rocky Mountains, and Canada. Transmission pipelines send natural gas from the fields and storage facilities. The smaller distribution pipelines deliver gas to individual businesses or residences.[18]

In Santa Clara County, approximately 443.1 million therms of natural gas were consumed in 2023 (the most recent year for which data are available).[19] In 2023, natural gas in Santa Clara County was

18 Pacific Gas and Electric Company. 2025. *Core Gas Supply*. Available: https://www.pge.com/en/about/doing-business-with-pge/core-gas-supply.html. Accessed: August 21, 2025.

19 A *therm* is a unit of heat equivalent to 100,000 British thermal units (BTUs).

consumed primarily by the residential sector (56 percent), followed by the nonresidential sector (44 percent).[20]

Limits of Work

The existing buildings within the Limits of Work are mostly vacant. As of mid-2024, approximately 42 people were employed within the Limits of Work; no full-time residents or short-term occupants (e.g., summer interns) lived within the Limits of Work. Therefore, existing uses within the Limits of Work consume relatively small amounts of energy. Table 3.6-2 provides the existing energy usage within the Limits of Work.

As stated previously, PG&E provides natural gas and electricity to NASA ARC and thus to the Project Site via right-of-way electric and natural gas lines. There is an existing 2.4-kilovolt switchgear in Building 104 on the Project Site that currently serves infrastructure adjacent to the Project Site. In addition, an existing gas main runs south to north through the Project Site within Dailey Road, then continues from the east side of Building 104 to Shenandoah Plaza. There is also an existing gas main along the north side of Wescoat Road near Building 509, and an existing PG&E natural gas meter on the south side of the Project Site.

Table 3.6-2. Existing Operational Energy Resource Consumption within the Limits of Work (2024)

Source	Usage (Million BTU/year)
Mobile Sources [a]	1,741
Building Electricity	2,434
Stationary Sources [b]	0
Total	**4,175**

Source: Air Quality, Health Risk, and GHG Technical Report included in Appendix 3.3-1 of this joint EIR/EIS.
Notes:
BTU= British thermal units
[a] Mobile sources include energy consumed by diesel, gasoline, natural gas, and electricity-fueled vehicles.
[b] There are no existing stationary sources, such as generators, on the Project Site that would consume diesel fuel.

3.6.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located

[20] California Energy Commission. 2025. *Natural Gas Consumption*. Available: https://www.energy.ca.gov/files/energy-consumption-data-files. Accessed: August 21, 2025.

on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies.

This section summarizes plans, policies, and regulations considered in the analysis.

3.6.3.1 Federal Regulations

Energy Policy and Conservation Act

The Energy Policy and Conservation Act of 1975 (EPCA), enacted December 22, 1975, is a United States Act of Congress that responded to the 1973 oil crisis by creating a comprehensive approach to federal energy policy. The primary goals of EPCA are to increase energy production and supply, reduce energy demand, provide energy efficiency, and give the executive branch additional powers to respond to disruptions in energy supply. Most notably, EPCA established the Strategic Petroleum Reserve, the Energy Conservation Program for Consumer Products, and Corporate Average Fuel Economy regulations.

Energy Policy Act of 2005

Energy Policy Act of 2005 is a federal law signed by President George W. Bush on August 8, 2005, at Sandia National Laboratories in Albuquerque, New Mexico. The act, described by proponents as an attempt to combat growing energy problems, changed U.S. energy policy by providing tax incentives and loan guarantees for energy production of various types. The most consequential aspect of the law was to greatly increase ethanol production for blending with gasoline. The law also repealed the Public Utility Holding Company Act of 1935, effective February 2006.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act (EISA) of 2007 aims to improve vehicle fuel economy and reduce U.S. dependence on petroleum. EISA includes provisions to increase the supply of renewable alternative fuel sources by setting a mandatory Renewable Fuel Standard, which requires transportation fuel sold in the United States to contain a minimum of 36 billion gallons of renewable fuels annually by 2022. In addition, the law sets the Corporate Average Fuel Economy (CAFE) standard at 35 miles per gallon for passenger cars and light trucks by 2020. EISA also includes grant programs to encourage the development of cellulosic biofuels, plug-in hybrid electric vehicles, and other emerging electric vehicle technologies. The law is projected to reduce GHG emissions by 9 percent by 2030.

Executive Order 13834

Executive Order (EO) 13834 requires federal agencies to reduce water consumption and building energy use, implement cost-saving energy efficiency measures, meet statutory requirements for renewable energy and energy consumption, and to track and report on greenhouse gas emissions, energy and water savings, and energy management activities.

Executive Order 14154

EO 14154 rescinded several previous EOs pertaining to energy and focuses on improving energy and critical minerals identification, permitting, leasing, development, production, and distribution and increasing the generation capacity in the United States to provide reliable, diversified, and affordable energy resources.

NASA Ames Development Plan

The NASA Ames Development Plan (NADP) is the long-term master plan for NASA's federal campus at Moffett Field published in 2002. The NADP details transformation of the original 500-acre campus of ARC and 1,500 acres of the former Naval Air Station Moffett Field into an integrated, dynamic research and education community. The transformation was led by the establishment of the NRP, a research-and-development campus for partners from academia, industry, and non-profit organizations with shared goals in support of NASA's mission.

The NADP includes planning principles that help guide the development throughout the entirety of NASA ARC. The planning principles include sustainability and resource conservation. The sustainability planning principle includes incorporating sustainable design concepts into development, such as constructing and operating new development in accordance with LEED guidelines. Additionally, the resource conservation planning principle includes energy conservation, which could be achieved through installing energy-efficient lighting, incorporating HVAC equipment and roof materials in accordance with Title 24 energy standards, and installing low-flow plumbing fixtures and passive solar design features.

3.6.3.2 State Regulations

Warren-Alquist Act

The Warren-Alquist Act, enacted in 1976, mandated that CEC create and periodically update Building Energy Efficiency Standards (Standards) for California. The Standards address newly constructed buildings and additions and alterations to existing buildings. The Standards have, in combination with appliance efficiency standards and utility-sponsored incentive programs, strongly contributed to California's per-capita electricity consumption remaining relatively constant since the mid-1970s. Since the first adoption in 1977, the Standards have been periodically updated. The most recent update, the 2025 Building Energy Efficiency Standards, went into effect on January 1, 2026, and are described in more detail under *Title 24, Part 6, Energy Efficiency Standards*.

Renewables Portfolio Standard

The Renewables Portfolio Standard (RPS) is one of California's key programs for advancing renewable energy. The program sets continuously escalating renewable energy procurement requirements for the state's load-serving entities. Generation must be procured from RPS-certified facilities. CEC verifies RPS claims.

Assembly Bill 32

The passage of Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006, marked a watershed moment in California's history. By requiring a sharp reduction of GHG emissions,

California set the stage for its transition to a sustainable, low-carbon future. AB 32 was the first program in the country to take a comprehensive, long-term approach to address climate change and does so in a way that aims to improve the environment and natural resources while maintaining a robust economy.

Assembly Bill 1493

In 2002, recognizing that global warming would impose compelling and extraordinary impacts on California, the legislature adopted and the governor signed AB 1493, Chapter 200, Statutes of 2002, authored by Assembly member Pavley. The bill recognized that global warming (climate change) is a public health concern, that motor vehicles are a major source of the state's GHG emissions, and that reducing these emissions will protect public health and the environment while stimulating the economy and enhancing job opportunities. Among other things, the bill directed the California Air Resources Board (CARB) to adopt regulations that achieve the maximum feasible and cost-effective reduction of GHG emissions from passenger vehicles, beginning with the 2009 model year. CARB approved those regulations, sometimes called the Pavley regulations, at its September 2004 hearing, and they were adopted in their final form in August 2005. In December 2005, CARB submitted a request to the U.S. Environmental Protection Agency (EPA) for a waiver of preemption under the federal Clean Air Act to allow California to enforce its GHG emission standards. EPA granted the waiver in July 2009. However, on May 22, 2025, the U.S. Senate voted to rescind California's waiver under the Congressional Review Act (CRA). On June 12, 2025, California filed suit, arguing the decision is an inappropriate use of the CRA. As of the writing of this document, the legal process is still ongoing, and the face of California's vehicle emissions regulations remains uncertain.

Senate Bill 350

The Clean Energy and Pollution Reduction Act (Senate Bill [SB] 350) established clean energy, clean air, and GHG reduction goals, including reducing GHG to 40 percent below 1990 levels by 2030 and to 80 percent below 1990 levels by 2050. CEC is working with other state agencies to implement the bill.

Senate Bill 100

SB 100 established a landmark policy requiring renewable energy and zero-carbon resources supply 100 percent of electric retail sales to end-use customers by 2045. It requires CEC, CPUC, and CARB to prepare a report. The bill would make the bill's provisions contingent upon an appropriation by the legislature for its purposes.

Senate Bill 1020

SB 1020 builds on the state's 2018 commitment to achieve 100 percent zero-carbon electricity by 2045 (a commitment that Environment California also spearheaded). On top of the state's existing requirement of 60 percent renewable electricity by 2030, SB 1020 sets new benchmarks of 90 percent clean energy by 2035 and 95 percent clean energy by 2040. Codified interim goals will ensure California hits its 100 percent clean energy goals in a timely and organized manner.

Senate Bill 1389

The CEC is responsible for, among other things, forecasting future energy needs of the state and developing renewable energy resources and alternative renewable energy technologies for buildings, industry, and transportation. SB 1389 (Chapter 568, Statutes of 2002) requires the CEC to prepare a biennial integrated energy policy that assesses major energy trends and issues facing the state's electricity, natural gas, and transportation fuel sectors. The report is also intended to provide policy recommendations to conserve resources, protect the environment, and ensure reliable, secure, and diverse energy supplies. The CEC is currently preparing the 2025 Integrated Energy Policy Report.

Senate Bill 375

SB 375 (Chapter 728, Statutes of 2008) directs CARB to set regional targets for reducing GHG emissions. The new law establishes a "bottom up" approach to ensure that cities and counties are involved in the development of regional plans to achieve those targets.

SB 375 builds on the existing framework of regional planning to tie together the regional allocation of housing needs and regional transportation planning in an effort to reduce GHG emissions from motor vehicle trips.

Executive Order N-79-20

On August 25, 2022, CARB approved the Advanced Clean Cars II rule, requiring all new vehicles sold in California to be zero-emission vehicles (ZEV) by 2035. Governor Newsom laid the foundation for the rule with his September 23, 2020, EO N-79-20. The rule accelerates the increased sales percentages of passenger ZEVs and plug-in hybrid electric vehicle automakers are required to meet starting in 2026. This rule is an important component of the State's plan to achieve net-zero emissions by 2045.

Executive Order B-17-12

The governor, through EO B-17-12, calls for agencies statewide to reduce their leased space footprint and consolidate into available state-controlled space.

Executive Order B-16-12

EO B-16-12, signed by Governor Brown, orders state entities, under the direction of the governor, including CARB, CEC, and the California Public Utilities Commission (CPUC), to support rapid commercialization of zero-emissions vehicles. It also directs these entities to achieve various benchmarks related to zero-emissions vehicles.

California Code of Regulations, Title 20, Parts 1600–1608

California's Appliance Efficiency Regulations (California Code of Regulations Title 20, Parts 1600–1608) contain energy performance, energy design, water performance, and water design standards for appliances (including refrigerators, ice makers, vending machines, freezers, water heaters, fans, boilers, washing machines, dryers, air conditioners, pool equipment, and plumbing fittings) that are sold or offered for sale in California. These standards are updated regularly to allow consideration of new energy efficiency technologies and methods.

Title 24, Part 6, Energy Efficiency Standards

Title 24, Part 6, Building Energy Efficiency Standards (the Energy Code), are part of the California Code of Regulations and are included in California's overall Title 24 Building Standards Code. California's Energy Code promotes efficient building energy use to protect people and the environment. The standards are updated every 3 years. The current Energy Efficiency Standards were adopted in 2025 and took effect on January 1, 2026. The 2025 updates focus on making buildings more energy efficient through encouraging the use of energy efficient HVAC equipment and incorporating the use of clean energy through onsite solar panels and battery storage systems.

Title 24, Part 11, Green Building Standards

The California Green Building Standards Code—Part 11, Title 24, California Code of Regulations—known as CALGreen, is the first-in-the-nation mandatory green building standards code. In 2007, California Building Standards Code developed green building standards in an effort to meet the goals of California's landmark initiative AB 32, which established a comprehensive program of cost-effective reductions of GHG to 1990 levels by 2020. CALGreen, which applies to the planning, design, operation, construction, use and occupancy of buildings, requires energy- and water-efficient indoor infrastructure to be installed for all new projects (residential and non-residential) and projects with significant additions or alterations, beginning January 1, 2011. Additionally, CALGreen includes both mandatory and voluntary measures. The mandatory measures apply to all projects and set minimum sustainability goals, while the voluntary measures add additional sustainability requirements beyond the mandatory measures that could be adopted by local jurisdictions.

Advanced Clean Car Program

Advanced Clean Cars combines several regulations into one package including the low-emission vehicle criteria, GHG regulations, and the ZEV regulation. Advanced Clean Cars I was adopted in 2012, and Advanced Clean Cars II was adopted in 2022. These regulations rapidly scale down emissions of light-duty passenger cars, pickup trucks, and sport utility vehicles and require an increased number of ZEVs to meet air quality and climate change emissions goals. In October 2023, staff launched a new effort to consider potential amendments to the Advanced Clean Cars II regulations, including updates to the tailpipe GHG emission standard and limited revisions to the low-emission vehicle and ZEV regulations.

Many of California's vehicle emissions standards are enabled through its CAA waiver, which allows the state to set stricter standards than the federal government. On May 22, 2025, the U.S. Senate voted to rescind California's waiver under the CRA. On June 12, 2025, California filed suit, arguing the decision is an inappropriate use of the CRA. As of the writing of this document, the legal process is still ongoing, and the face of California's vehicle emissions regulations remains uncertain.

California Energy Efficiency Action Plan

The 2019 California Energy Efficiency Action Plan charts progress toward doubling energy efficiency by 2030, explains where current targets are falling short, and makes important recommendations for how the state can achieve its goals.

3.6.4 CEQA Findings

The following sections describe the environmental impacts of the proposed project on energy in accordance with CEQA. The sections describe the thresholds used to determine whether an impact would be significant and methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts for energy in accordance with NEPA is provided separately in Section 4.5.6, *Energy*, in Chapter 4, *Environmental Impact Statement.*

3.6.5 Thresholds of Significance

In accordance with Section 15126.2 and Appendix G of the State CEQA Guidelines, the project would have the potential to have a significant effect on land use and planning if it would result in any of the conditions listed below.

Would the project:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to energy?

3.6.6 Methods for Analysis

Energy impacts associated with construction and operation of the proposed project were assessed and quantified using standard and accepted software tools and techniques, such as the California Emissions Estimator Model (CalEEMod) and the CARB EMFAC2021. The analysis also considered the list of energy impact possibilities and potential conservation measures included in Appendix F of the CEQA Guidelines for determining whether a project would result in the wasteful, inefficient, or unnecessary consumption of energy resources.

3.6.6.1 Construction

Construction activities for the proposed project would use energy, such as electricity for off-road construction equipment and fuel for off-road construction equipment, haul trucks, vendor trips, and workers' trips over the approximately 14-year construction period. Based on current information, it is anticipated that construction would begin, at the earliest, in 2027. However, based on information available at the time of the technical analysis, energy consumption was quantified assuming construction would begin in 2026. It is projected that the intensity of energy consumption of equipment and vehicle operation in 2027 would be the same or lower than under 2026 conditions because of improvements in engine technology and regulations to reduce combustion emissions, and thereby energy consumption. Accordingly, the construction analysis reflects a realistic to conservative representation of energy consumption.

The construction schedule, equipment operating details, trip numbers and lengths, and material quantities were based on project-specific information provided by the Project Proponent for the CEQA Proposed Project and CEQA Reduced Density Alternative. The intensity of construction for the

CEQA Proposed Project and the CEQA Reduced Density Alternative with or without the No Student/Faculty Housing Variant/Sub-Alternative (Variant) would therefore be the same because the Variant does not alter total square footage constructed in either instance. Thus, energy consumption quantified for the CEQA Proposed Project and the CEQA Reduced Density Alternative are representative of conditions with or without the Variant. Construction of the Water Reuse Facility (WRF) Option or Central Utility Plant (CUP) Option would require additional off-road equipment and on-road vehicles, beyond that required for construction of the CEQA Proposed Project.

Assumptions regarding typical construction activities and default values from the California Emissions Estimator Model (CalEEMod) Version 2022.1, which considers a project's location and land use type, were also used. The calculation of energy consumption from equipment and vehicles, in the form of gasoline and diesel fuel use, was converted from estimated carbon dioxide (CO_2) emissions based on the amount of CO_2 emitted per gallon of fuel combusted.[21] Electricity consumption data were provided by the Project Proponent.

Detailed model assumptions and inputs for the analysis of construction CO_2 emissions are provided in Appendix 3.3-1 of this joint EIR/EIS.

3.6.6.2 Operations

The proposed project would remove existing uses on the site that currently use energy. As such, the net effect of the proposed project would be the difference between existing uses and project uses. Energy consumption associated with operation of the existing uses and the proposed project includes building natural gas (existing uses only) and electricity use; diesel, electricity, gasoline, and natural gas use for mobile sources (i.e., vehicles); and fuel for diesel-fueled emergency generators (project uses only).

Based on current information, it is anticipated that the first full year of operations would be 2041. However, based on information available at the time of the technical analysis, energy consumption was quantified assuming project operations would begin in 2040. It is projected that the intensity of energy consumption of some operational sources, such as vehicle operation, in 2041 would be lower than under 2040 conditions because of improvements in engine technology and regulations to reduce combustion emissions, and thereby energy consumption. Accordingly, the operations analysis reflects a conservative representation of energy consumption.

Project energy usage would depend on the mix of land uses ultimately constructed (Section 2.3.2.2, *Buildout Assumptions*, discusses the uses under each alternative identified for EIR analysis purposes). For existing (2024) conditions, electricity and mobile source fuel consumption use was quantified using CalEEMod Version 2022.1 based on the existing land use types and buildings. For full buildout (2041) conditions, electricity consumption was provided by the Project Proponent. As discussed in Chapter 2, under Section 2.3.2.7, *Sustainability Features*, the proposed project would incorporate various sustainability strategies that will minimize potential impacts on energy resources. These sustainability features were included in the calculation of project electricity consumption, including an all-electric design (i.e., no building natural gas).

[21] U.S. Energy Information Administration. 2024. Carbon Dioxide Emissions Coefficients. Release date: September 18, 2024. Available: https://www.eia.gov/environment/emissions/co2_vol_mass.php. Accessed: December 17, 2025.

Fuel consumption associated with vehicle trips to and from the Project Site was quantified using vehicle miles traveled (VMT) data from Fehr & Peers. The VMT data account for benefits from project sustainable transportation features, such as the transportation demand management (TDM) plan, as quantified by the project transportation consultants. Project VMT was converted to diesel, gasoline, electricity, and natural gas consumption based on the countywide vehicle fleet mix and energy consumption factors from the California Air Resources Board's (CARB) EMFAC2021.[22]

Diesel consumption associated with the diesel-powered emergency generators was converted from the estimated CO_2 emissions based on the amount of CO_2 emitted per gallon of diesel fuel.

The Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS includes the CalEEMod output files and fuel use calculations related to the air quality analysis that were used to inform the energy analysis.

3.6.7 Impacts and Mitigation Measures

Impact CEQA-ENE-1: Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

[22] As discussed in the Air Quality, Health Risk Assessment, and Greenhouse Gas Technical Report (Appendix 3.3-1 of this joint EIR/EIS), the air quality analysis (which was used to inform the energy analysis) uses mobile source emission rates from EMFAC2021 with CARB's off-model adjustments. While CARB has released EMFAC2025 version 2.1.0, the tool was not available at the time the Notice of Preparation was issued for this environmental document. EMFAC2025 also has not yet been approved by the EPA. The off-model adjustment factors for EMFAC2021 address Congressional Resolutions that disapproved EPA's decisions to grant California waivers for several regulations, including Advanced Clean Trucks (ACT), Zero-Emission Airport Shuttle, Heavy-Duty Vehicle and Engine Emission Warrant and Maintenance Provisions (Warranty Phase I), and Heavy-Duty Omnibus (Omnibus). While the action is currently being litigated, no injunction has been issued to block the revocation, and California can no longer enforce the regulations.

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

Construction of the CEQA Proposed Project would result in the temporary usage and consumption of energy resources on the Project Site. Construction energy use would include electricity used to power electric construction equipment, mobile offices, or water delivered to construction sites; gasoline and diesel fuel used for transportation of workers and haul trucks to and from construction sites; and fuel used for operation of off-road equipment. Additionally, as discussed in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, the CEQA Proposed Project would require the installation of new connections to the surrounding PG&E grid to provide service to future buildings throughout the Project Site. Construction of the proposed energy infrastructure improvements incorporated into the CEQA Proposed Project would result in ground-disturbing activities that would consume energy.

Construction-related energy usage and consumption would occur intermittently throughout the course of CEQA Proposed Project buildout and would vary substantially depending on the level of activity, length of construction period, specific construction operations, types of equipment, and number of personnel. Table 3.6-3 summarizes construction energy consumption for the CEQA Proposed Project. The CEQA Proposed Project would consume approximately 899,103 million British thermal units (BTU) or approximately 263,704 megawatt hours (MWh) over the 14-year construction period, whereas the CEQA Proposed Project with the CUP Option would consume 914,788 million BTUs or 268,305 MWh, and the CEQA Proposed Project with the WRF Option would consume 911,392 million BTUs or 267,309 MWh. Construction of the CUP in 2035 and 2036 and construction of the WRF in 2038 and 2039 would require additional off-road equipment and on-road vehicles that would consume additional energy beyond what is required for the CEQA Proposed Project. As such, the CEQA Proposed Project with the CUP Option or with the WRF Option would consume more energy than the CEQA Proposed Project.

The types of land uses envisioned for the CEQA Proposed Project would involve construction activities typical of development projects in the surrounding region, and no land uses are expected to require an extraordinary amount of energy consumption during construction, as may occur with large, industrial facilities like new power plants or dams, because no such land uses are proposed within the Project Site. Additionally, construction-related energy consumption would be temporary and would cease upon completion of all construction activities. Furthermore, during construction, waste would be separated by source and tracked to be diverted away from landfills, with the goal of recycling more than 50 percent of construction and demolition waste. This would reduce the amount of energy intensiveness associated with building materials, including discarded construction and demolition waste. Therefore, construction of the CEQA Proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of energy resources. This impact would be less than significant.

Additionally, while not required to reduce the significance of energy impacts during construction of the CEQA Proposed Project, implementation of Mitigation Measure AQ-1, Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction; Mitigation Measure AQ-2, Zero-Emission On-Road Vehicles during Construction; and Mitigation Measure GHG-1, Best Management Practices for Construction-Related GHG Emissions, which would be required to mitigate air quality and greenhouse impacts, respectively, would further reduce construction energy consumption. Specifically, as discussed in Section 3.3, *Air Quality*, of this joint EIR/EIS, Mitigation Measure AQ-1

would require project contractors to use electric-powered lifts, welders, air compressors, and mini-excavators, which would eliminate energy consumption from diesel or fossil-fueled powered lifts, welders, air compressors, and mini-excavators and improve energy efficiency during construction. Similarly, Mitigation Measure AQ-2 would require all on-road vehicles to achieve minimum zero-emission performance standards, such as requiring 25 percent zero-emission light-duty on-road vehicles during Phases 1 and 2 of construction, which would reduce energy consumption and promote energy efficiency. Mitigation Measure GHG-1 would require construction contractors to implement the Bay Area Air District's construction best management practices, which include, but are not limited to, using zero-emission and hybrid-powered equipment to the greatest extent possible; requiring all diesel-fueled off-road construction equipment to be equipped with Tier 4 Final compliant engines or better; requiring all on-road heavy-duty trucks to be zero emissions or meet the most stringent model year emissions standard where available; and using alternative fuels. Implementation of these measures, which would be required to reduce other construction-related impacts, would indirectly reduce the amount of energy consumed during the construction of the CEQA Proposed Project.

Table 3.6-3. Estimated Energy Consumption under Construction of the CEQA Proposed Project

Year	CEQA Proposed Project (Million BTU)	CEQA Proposed Project with CUP Option (Million BTU)	CEQA Proposed Project with WRF Option (Million BTU)
2027	20,628	20,628	20,628
2028	55,611	55,611	55,611
2029	79,071	79,071	79,071
2030	44,019	44,019	44,019
2031	25,223	25,223	25,223
2032	139,024	139,024	139,024
2033	109,079	109,079	109,079
2034	43,617	43,617	43,617
2035	71,401	81,703	71,401
2036	72,915	78,298	72,915
2037	31,686	31,686	31,686
2038	87,581	87,581	96,028
2039	98,773	98,773	102,616
2040	20,473	20,473	20,473
Total	**899,103**	**914,788**	**911,392**

Notes:
BTU= British thermal units; WRF = Water Reuse Facility; CUP = Central Utility Plant

Operation

Once operational, the CEQA Proposed Project would generate vehicle trips, which would consume gasoline, diesel, natural gas, and electricity. The CEQA Proposed Project would also result in the consumption of electricity and diesel for operational uses such emergency generators and landscaping activities.

As discussed in Section 3.6.6, *Methods for Analysis*, and consistent with the requirements of Appendix F of the CEQA Guidelines, the proposed project's operational energy consumption is evaluated under existing (2024) and full buildout year (2041) conditions. Table 3.6-4 presents the results of the operational energy analysis (expressed in terms of million BTU or MMBtu) for the CEQA Proposed Project with and without the CUP Option and WRF Option. The CEQA Proposed Project's net energy consumption is determined by taking the difference in operational energy consumption between "project buildout (2041)" conditions and "existing (2024)" conditions at the Project Site.

As shown in Table 3.6-4, except for stationary sources, energy consumption under the CEQA Proposed Project with the WRF Option would be the same as the CEQA Proposed Project. One additional diesel-powered emergency generator would be maintained to support the WRF. Operation of the CEQA Proposed Project with the WRF Option would consume approximately 492,881 million BTU or 144,561 MWh per year, which is a net increase of approximately 488,696 million BTU or 143,333 MWh per year relative to existing conditions. Similarly, as shown in Table 3.6-4, operation of the CUP Option would reduce electricity and overall energy consumption relative to the CEQA Proposed Project. The CEQA Proposed Project with the CUP Option would result in a net increase of approximately 462,205 million BTU or 135,563 MWh per year, which is approximately 25,809 million BTU or 7,570 MWh per year less than the CEQA Proposed Project.

Table 3.6-4. Estimated Operational Energy Consumption under the CEQA Proposed Project, CUP Option, and WRF Option in Million BTU/Year

Analysis Condition/Source	CEQA Proposed Project (Million BTU/Year)	CEQA Proposed Project with CUP Option (Million BTU/Year)	CEQA Proposed Project with WRF Option (Million BTU/Year)

Energy per Square Foot (Million BTU/sf)			
Existing	0.02	0.02	0.02
Proposed	0.21	0.20	0.21

Source: Air Quality, Health Risk, and GHG Technical Report included in Appendix 3.3-1 of this joint EIR/EIS.
Notes:
BTU = British thermal unit
[a] Mobile sources include energy consumed by diesel, gasoline, natural gas, and electricity-fueled vehicles.
[b] There are no existing stationary sources, such as diesel-fueled generators, on the Project Site.
[c] Landscaping equipment consumes fossil fuels under the unmitigated condition.
[d] Stationary sources include energy consumed by the proposed diesel-fueled emergency generators.

The CEQA Proposed Project would be designed to incorporate environmentally sustainable features using the latest strategies while improving environmental conditions throughout the site, reducing energy consumption, and improving energy efficiency. Specifically, the CEQA Proposed Project would incorporate on-site renewable energy resources, such as photovoltaic systems and battery storage systems that would be distributed throughout building within each Subarea, which would meet or exceed minimum Energy Code compliance requirements and offset the energy use from each proposed building. In addition, the proposed building design would respond to the climate by optimizing thermal comfort through passive cooling and windbreaks and prioritizing daylight within floor plates, buildings, and outdoor spaces, which would increase use of renewable energy and promote energy efficiency and conservation. The CEQA Proposed Project would achieve, at a minimum, a LEED Silver rating, and have an all-electric design for new building systems (e.g., heating, ventilation, and air conditioning; mechanical), which would result in buildings that outperform the current 2022 California Building Energy Title 24 energy efficiency standards. The CEQA Proposed Project would also reduce water use through the use of low-flow and flush fixtures and on-site recycled water systems for drought-friendly landscaping. The CEQA Proposed Project would also include parking spaces designed to meet California Building Code accessible parking, carpool/vanpool, electric vehicle (EV) charging station, and EV-capable requirements.

The CEQA Proposed Project would include a project-specific TDM plan to reduce the vehicle trips and associated VMT generated by the proposed project through a range of design features (e.g., mix of complementary land uses to increase internal trips, on-site amenities to reduce off-site trips, pedestrian and bicycle infrastructure, preferential carpool and vanpool parking, limited automobile parking supply, and ample bicycle parking) and ongoing operational programs (e.g., transit pass/subsidy programs, shuttles, and participation in the NASA Research Park Transportation Management Association) to achieve TDM mode-shift targets and thereby reduce the number of trips made by project-generated employees, students/faculty and visitors. Appendix 2-4 of this joint EIR/EIS includes the project-specific TDM plan.[23] The project-specific TDM plan would reduce VMT and, consequently, the amount of energy consumed through mobile gasoline, diesel, and electricity use. Therefore, given the incorporation of the project sustainability features and project-specific TDM plan, operation of the CEQA Proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of energy resources. This impact would be less than significant.

[23] The project-specific TDM plan is tentative, as transportation-related studies may validate the approach in the TDM Plan or require adjustments to the TDM Plan.

Mitigation Measure TRAN-1 requires implementation of a mitigated TDM plan that further reduces VMT. Mitigation Measure AQ-6 requires the use of electric landscaping equipment during operations. Mitigation Measure TRAN-1 and Mitigation Measure AQ-6 would be required to mitigate transportation and air quality impacts, respectively. These mitigation measures are not required to reduce the significance of energy impacts during operation of the CEQA Proposed Project; however, implementation of these mitigation measures would reduce the amount of energy consumed during operation of the CEQA Proposed Project.

Mitigation Measures

No mitigation is required for this impact.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

Construction

As discussed under *Construction* for the CEQA Proposed Project, the same construction activities proposed and evaluated under the CEQA Proposed Project would occur under the Variant. The intensity of construction for the CEQA Proposed Project with or without the Variant would therefore be the same, and the energy consumption presented in Table 3.6-3 for the CEQA Proposed Project would also occur under the Variant. As shown in Table 3.6-3, construction activities would result in approximately 899,103 million BTUs or 263,704 MWh consumed over the proposed project's approximately 14-year construction period. This impact would be less than significant.

Operation

The same operational sources of energy consumption proposed and evaluated under the CEQA Proposed Project would occur under the Variant. Table 3.6-5 presents estimated operational energy consumption for the Variant under full-buildout conditions. While the Variant would result in an increase in net operational energy consumption of approximately 5,576 million BTU or 1,635 MWh per year due primarily to mobile sources compared to the CEQA Proposed Project, the Variant would use all-electric design and the same sustainability strategies, and project-specific TDM plan described for the CEQA Proposed Project. Therefore, like the CEQA Proposed Project, the Variant would result in a less-than-significant impact.

Table 3.6-5. Estimated Operational Energy Consumption under the CEQA Proposed Project with Variant

Analysis Condition/Source	Energy Consumption in Million BTU/Year
Existing (2024)

[b] There are no existing stationary sources, such as diesel-fueled generators, on the Project Site.
[c] Landscaping equipment consumes fossil fuels under the unmitigated condition.
[d] Stationary sources include energy consumed by the proposed diesel-fueled emergency generators.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Construction

As discussed under *Construction* for the CEQA Proposed Project, the same construction activities proposed and evaluated under the CEQA Proposed Project would occur under the CEQA Reduced Density Alternative, although to a slightly lesser extent due to the reduced size of the alternative. The energy consumption for construction of the CEQA Reduced Density Alternative is provided in Table 3.6-6. As shown in Table 3.6-6, construction activities would result in approximately 862,241 million BTUs or 252,893 MWh consumed over the proposed project's approximately 14-year construction period, compared to approximately 899,103 million BTUs or 263,704 MWh consumed during the CEQA Proposed Project. This impact would be less than significant.

Table 3.6-6. Estimated Energy Consumption under Construction of the CEQA Reduced Density Alternative

Year	CEQA Reduced Density Alternative (Million BTU)
2027	20,630
2028	55,613
2029	75,447
2030	39,402
2031	24,198
2032	137,242
2033	111,440

Year	CEQA Reduced Density Alternative (Million BTU)
2034	32,058
2035	70,100
2036	68,883
2037	27,845

Operation

The same operational sources of energy consumption proposed and evaluated under the CEQA Proposed Project would occur under the CEQA Reduced Density Alternative. Table 3.6-7 presents estimated operational energy consumption for the CEQA Reduced Density Alternative under full-buildout conditions. Compared to the CEQA Proposed Project, the CEQA Reduced Density Alternative would result in reduced net operational increases in energy consumption due primarily to reduced mobile sources and building electricity by approximately 197,278 million BTU or 57,861 MWh per year. The CEQA Reduced Density Alternative would use all-electric design and the same sustainability strategies and project-specific TDM plan as described for the CEQA Proposed Project. Therefore, like the CEQA Proposed Project, the CEQA Reduced Density Alternative would result in a less-than-significant impact.

Table 3.6-7. Estimated Operational Energy Consumption under the CEQA Reduced Density Alternative

Analysis Condition/Source	Energy Consumption in Million BTU/Year
Existing (2024)	
Mobile sources [a]	1,741
Landscaping equipment	10
Electricity	2,434
Stationary sources [b]	0
Total Existing	***4,185***

Analysis Condition/Source	Energy Consumption in Million BTU/Year
Energy per Square Foot (Million BTU/sf)	
Existing	0.02
Proposed	0.21

Source: Air Quality, Health Risk, and GHG Technical Report included in Appendix 3.3-1 of this joint EIR/EIS.
Notes:
BTU = British thermal unit
[a] Mobile sources include energy consumed by diesel, gasoline, natural gas, and electricity-fueled vehicles.
[b] There are no existing stationary sources, such as diesel-fueled generators, on the Project Site.
[c] Landscaping equipment consumes fossil fuels under the unmitigated condition.
[d] Stationary sources include energy consumed by the proposed diesel-fueled emergency generators.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

Construction

As discussed under *Construction* for the CEQA Reduced Density Alternative, the same construction activities proposed and evaluated under the CEQA Reduced Density Alternative would occur under the Variant. The intensity of construction for the CEQA Reduced Density Alternative with or without the Variant would therefore be the same, and the energy consumption presented in Table 3.6-6 for the CEQA Reduced Density Alternative would also occur under the Variant. As shown in Table 3.6-6, construction activities would result in approximately 862,241 million BTUs or 252,893 MWh consumed over the proposed project's approximately 14-year construction period. This impact would be less than significant.

Operation

The same operational sources of energy consumption proposed and evaluated under the CEQA Reduced Density Alternative would occur under the Variant. Table 3.6-8 presents estimated operational energy consumption for the Variant under full-buildout conditions. Compared to the CEQA Reduced Density Alternative, while the Variant would result in increased net operational energy consumption due primarily to mobile sources by approximately 5,808 million BTU or 1,703 MWh per year, the Variant would use all-electric design and the same sustainability strategies and project-specific TDM plan as described for the CEQA Proposed Project and CEQA Reduced Density Alternative. Therefore, like the CEQA Reduced Density Alternative, the Variant would result in a less-than-significant impact.

Table 3.6-8. Estimated Operational Energy Consumption under the CEQA Reduced Density Alternative with Variant

Analysis Condition/Source	Energy Consumption in Million BTU/Year

Mitigation Measures

No mitigation is required for this impact.

Impact CEQA-ENE-2: Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

Federal, state, and local renewable energy and energy efficiency plans applicable to the proposed project are discussed in Section 3.6.3, *Plans, Policies, and Regulations*. Federal and state plans include the Energy Policy and Conservation Act, EOs 13834 and 14154, Assembly Bill 1493 Pavley Rules, California Title 24 energy efficiency standards, EO B-16-12, SB 350, and SB 100. Each of these plans contain required standards related to energy efficiency and renewable energy development. Local plans that address energy efficiency and are designed to achieve the state's RPS mandates include PG&E's 2022 Integrated Resource Plan.

Throughout construction, waste would be source separated and tracked to divert it away from landfills, with a target of recycling more than 50 percent of construction and demolition waste. Diverting and recycling of these materials would reduce the amount of fossil fuel consumed during construction as well as the energy intensity associated with building materials, including discarded construction and demolition waste, consistent with CALGreen.

Operation of the CEQA Proposed Project with the WRF Option would result in the greatest net increase in energy consumption in comparison to existing conditions, and would consume approximately 492,199 million BTU or 144,561 MWh per year. Operation of the CEQA Proposed Project (including both the CEQA Proposed Project with CUP Option and the CEQA Proposed project with the WRF Option)would increase energy use per square foot with the approximately 13-fold increase in building area compared with existing conditions. Although energy use per square foot would increase under the CEQA Proposed Project, the proposed density at the Project Site would minimize the physical footprint where people would stay, work, and socialize, decreasing the amount of water and energy consumed per capita compared with the consumption that would otherwise occur if such uses were spread out over a larger area beyond the Project Site. In addition, by providing a mix of housing/lodging, research and office, conference, and active uses on the site, the CEQA Proposed Project would create a location where amenities would be available in one place, reducing the time needed to travel off-site to other locations, as well as the amount of energy consumed by vehicle trips.

As discussed under Impact CEQA-ENE-1, and consistent with the energy conservation measures recommended in Appendix F of the CEQA Guidelines, the CEQA Proposed Project would incorporate multiple sustainability, energy-saving, and TDM features. The CEQA Proposed Project would achieve, at a minimum, a LEED Silver rating, and have an all-electric design for new building systems (e.g., heating, ventilation, and air conditioning; mechanical), which would result in buildings that outperform the current 2022 California Building Energy Title 24 energy efficiency standards. The CEQA Proposed Project would also meet the applicable CALGreen Tier 2 nonresidential voluntary requirement for EV parking spaces (i.e., 45 percent of all spaces to be EV capable, and 33 percent of the EV spaces to have EV supply equipment). The CEQA Proposed Project would include a project-

specific TDM plan that would reduce energy consumption (e.g., gasoline, diesel, electricity, natural gas). In addition, the CEQA Proposed Project would incorporate on-site renewable energy resources, such as photovoltaic systems and battery storage systems, which would offset some of the CEQA Proposed Project's operational energy consumption. Furthermore, the CEQA Proposed Project would use recycled water for irrigation and non-potable water uses within the proposed buildings.

The CEQA Proposed Project would be required to comply with state and local renewable energy and energy efficiency plans and would benefit from the resulting increases in energy efficiency and renewable energy development. Vehicles and energy use from increased VMT and average daily trips within the area are expected to become increasingly more efficient as a result of the regulations included in Pavley and EO B-16-12, which address average fuel economy and commercialization of zero-emissions vehicles, respectively. Building energy efficiency is also expected to increase as a result of compliance with Title 24 Building Codes, which are expected to move toward zero net energy for newly constructed buildings, and the shift toward 100 percent renewable energy under SB 350 and SB 100 regulations. Additionally, through incorporation of the sustainability and energy-saving project features described previously, the CEQA Proposed Project would be consistent with the provisions of the Energy Policy and Conservation Act and EOs 13834 and 14154, which require implementing measures to reduce water consumption and building energy use and increasing and diversifying energy generating resources, all with the overall goal to reduce energy demand and increase energy efficiency. With the CEQA Proposed Project, PG&E would continue to pursue the procurement of renewable energy sources to meet their RPS portfolio goals and comply with state regulations. Therefore, the CEQA Proposed Project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency, and the impact would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The impact details for the CEQA Proposed Project with the Variant would be the same as described for the CEQA Proposed Project. Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Proposed Project with the Variant. The same sustainability, energy-saving, and TDM features described for the CEQA Proposed Project would be implemented under the Variant. The CEQA Proposed Project with the Variant would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. This impact would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The impact details for the CEQA Reduced Density Alternative would be the same as described for the CEQA Proposed Project. Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Reduced Density Alternative. The same sustainability, energy-saving, and TDM features described for the CEQA Proposed Project

would be implemented under the CEQA Reduced Density Alternative. The CEQA Reduced Density Alternative would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. This impact would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The impact details for the CEQA Reduced Density Alternative with the Variant would be the same as described for the CEQA Proposed Project and the CEQA Reduced Density Alternative. Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project, CEQA Reduced Density Alternative, and the CEQA Reduced Density Alternative with the Variant. The same sustainability, energy-saving, and TDM features described for the CEQA Proposed Project and CEQA Reduced Density Alterntive would be implemented under the CEQA Reduced Density Alternative with the Variant. The CEQA Reduced Density Alternative with the Variant would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. This impact would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

3.6.8 Cumulative Impacts

The discussion of cumulative impacts addresses the topics evaluated in the corresponding project impacts in Section 3.6.7, *Impacts and Mitigation Measures*, above. The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Impact Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. The cumulative geographic context for energy resources is the service area of PG&E (i.e., the electrical and natural gas service area), which comprises the larger Northern California area, including the Project Site.

Impact CEQA-C-ENE-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to energy due to the wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation? (No Significant Cumulative Impact)

Cumultive projects within PG&E's service area could contribute to ongoing increases in demand for electricity and natural gas. These anticipated increases would be countered, in part, by ongoing increases in state and local requirements related to renewable energy and increased energy efficiency. The extent to which cumulative development through 2041, the proposed project's full buildout year, could result in wasteful, inefficient, or unnecessary consumption of energy resources would depend on the specific characteristics of new development. SB 100 obligates utilities to supply 100 percent carbon-free electricity by 2045. PG&E reached California's 2020 renewable energy goal 3 years ahead of schedule and is currently projected to meet the new SB 100 goal, which calls for 100 percent clean energy by 2045. Similarly, the Pavley Standards are expected to lower the demand for fossil fuels by requiring 100 percent of new vehicles sold by 2035 to be zero-emissions

vehicles. It also is anticipated that the state will continue to require the construction of energy efficient buildings through implemention of the State Building Code. Therefore, it is anticipated that future energy users will become more efficient and less wasteful over time.

Furthermore, as discussed above, buildout of the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would increase operational energy consumption on the Project Site when compared to existing conditions. Although energy intensity per square foot would increase, the proposed density at the Project Site would minimize the physical footprint where people would stay, work and socialize (under the CEQA Proposed Project and the CEQA Reduced Density Alternative); the proposed density would minimize the physical footprint where people would work and socialize under the Variant. As a result, the proposed density at the Project Site would decrease the amount of water and energy consumed per capita compared with the consumption that would otherwise occur if such uses were spread out over a larger area beyond the Project Site. Additionally, the sustainable and energy-saving design of the proposed buildings, as well as vehicles, would help to meet the increasingly robust regulations over time to achieve the state's renewable energy mandates. The proposed project would incorporate building design features that would reduce energy consumption, and increase renewable energy generation, which would partially offset some of the proposed project's operational energy demands. Therefore, the impacts of the cumulative projects, combined with the proposed project, would not result in a significant cumulative impact related to the wasteful, inefficient, or unnecessary consumption of energy.

Impact C-ENE-2: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to energy due to conflicts with or obstruction of a state or local plan for renewable energy or energy efficiency? (No Significant Cumulative Impact)

Cumulative projects within PG&E's service area would be required to comply with all adopted state and local renewable energy or energy efficiency regulations and plans. Cumulative projects through 2041 (the proposed project's full buildout year) would incorporate energy-saving features, similar to the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant), which would most likely result in compliance with adopted state and local renewable energy or energy efficiency regulations and plans. The proposed project would incorporate multiple sustainability, energy-saving, and TDM features. In addition, the proposed project would be required to comply with state and local renewable energy and energy efficiency plans and would benefit from the resulting increases in energy efficiency and renewable energy development. Therefore, the impacts of the cumulative projects, combined with the proposed project, would not result in a significant cumulative impact related to energy due to conflicts with or obstruction of plans for renewable energy or energy efficiency.

3.7 Geology, Soils, and Paleontological Resources

3.7.1 Introduction

This section evaluates the potential impacts on geology, soils, and paleontology that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Limits of Work and the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical report prepared for the project:

- *Preliminary Geotechnical Evaluation, Moffett Field NASA Research Park, Master Planning Phase, Mountain View, California* (Preliminary Geotechnical Evaluation) prepared by Langan, March 14, 2023 (Appendix 3.7-1 of this joint environmental impact report/environmental impact statement [EIR/EIS]).

The Preliminary Geotechnical Evaluation included a review of the numerous geotechnical investigations that apply to the Limits of Work and the region, as identified in Appendix 3.7-1 Some of the previous investigations included borings and cone penetrometer tests to evaluate subsurface conditions. The results of the testing are discussed in Section 3.7.2, *Affected Environment/Environmental Setting*, under *Site Topography and Subsurface Conditions*.

The Preliminary Geotechnical Evaluation developed preliminary conclusions and recommendations regarding appropriate foundation types, design parameters, and seismic coefficients for project development based on the previous investigations, some of which directly border the Limits of Work to the northeast (Hanger One) and southwest. The Preliminary Geotechnical Evaluation has been relied on due to site access constraints limiting physical investigations during the environmental review process. The evaluation indicates that a final geotechnical investigation should be performed at the Limits of Work to develop final geotechnical recommendations. Information and conclusions from the Preliminary Geotechnical Evaluation are incorporated into this section. Additional information was obtained from other reports and memoranda as well as government agency documents and websites.

No questions or concerns related to geology, soils, seismicity, and paleontological resources were raised in the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*).

3.7.2 Affected Environment/Environmental Setting

For the purposes of analyzing geology, soils, and seismicity, the study area is defined as the Limits of Work. The study area for paleontological resources is defined by a 150-foot buffer outside the Limits of Work plus underlying units to the maximum depth of excavation, 25 feet below ground surface (bgs) (Paleontological Resources Study Area).

3.7.2.1 Regional Setting

Geology

The Limits of Work are within the Coast Ranges geomorphic province, a relatively geologically young and seismically active region, characterized by northwest-trending mountains and valleys. The mountains and valleys associated with the Coast Ranges run approximately parallel to the San Andreas fault, stretching from the Oregon border to southern California.[1,2] Elevations range between 2,000 and 6,000 feet above sea level. The Limits of Work are located within the only major break in the Coast Ranges, the depression containing the San Francisco Bay Area (Bay Area) and the Santa Clara Valley.

The Limits of Work are principally underlain by alluvial deposits resulting from erosion of the Santa Cruz Mountains and deposition from San Francisco Bay. The alluvial deposits are estimated to be 1,000 feet deep or more before encountering bedrock.[3,4]

Regional Seismicity

The entire Bay Area is within the San Andreas Fault Zone, a complex of active faults. An active fault is one that has experienced displacement within the last 11,700 years and is expected to move again at some point in the future.[5] Numerous historic earthquakes have been generated in Northern California on faults within the San Andreas Fault Zone. This level of active seismicity results in a relatively high seismic risk in the Bay Area.

The Limits of Work are vulnerable to seismic activity, given its proximity to several active faults. The major active faults in the region that are closest to the Limits of Work are the Monte Vista-Shannon, San Andreas, Pilarcitos, and Hayward-Rodgers Creek faults. Table 3.7-1 lists active regional faults, the approximate distance from the Limits of Work, the direction from the Limits of Work, and the mean characteristic moment magnitude.[6]

3.7.2.2 Limits of Work

Site Topography and Subsurface Conditions

The topography at the Limits of Work is relatively level, with site grades ranging from approximate elevations 20 and 30 feet with a general slope downward from the southern boundary to the northern boundary of the site.[7] The site is underlain by alluvial deposits that predominantly consist of medium stiff to hard clay and sandy clay with interbedded lenses and layers of medium dense to very dense sand and gravel with varying amounts and types of fines to the maximum depth explored of 100 feet below ground surface (bgs). The alluvial deposits are estimated to be 1,000 feet or more

[7] Elevations reference World Geodetic SystemDatum of 1984 (WGS84) as shown on Google Earth.

before encountering bedrock.[8] Near-surface clay is stiff to hard silty clay, sandy clay, and clay with silt and varies in thickness from about 5 to 15 feet.

Groundwater

The Limits of Work are within the Santa Clara Valley Groundwater Basin, Santa Clara Subbasin. Groundwater within the Santa Clara Subbasin is generally found in aquifers with high-permeability sand and gravel layers interbedded between low-permeability clay and silt layers. The low-permeability layers confine the aquifers and limit the migration of groundwater between aquifers. Recharge within the Santa Clara Subbasin generally occurs along the margins and southern portion of the subbasin where coarse-grained sediments predominate. The recharge area includes the alluvial fan and fluvial deposits along the edge of the subbasin where high rates of lateral and vertical permeability allow surface water to infiltrate the aquifers. The percolation of surface water in recharge areas replenishes unconfined groundwater within the recharge area and contributes to the recharge of principal aquifers in the confined area through subsurface flow. Previous investigations at or near the site have encountered groundwater at depths ranging from between 6 to 13 feet bgs. However, groundwater levels are expected to fluctuate depending on rainfall and other seasonal conditions. The historic high groundwater level, based on the California Geological Survey (CGS) Seismic Hazard Zone Report for the Mountain View Quadrangle, is approximately 5 feet. [9]

Surface Fault Rupture

Surface rupture occurs when the ground surface is broken by fault movement during an earthquake and can be assumed to occur along an active or potentially active major fault trace. Areas that are most susceptible to fault rupture are delineated by the CGS Alquist-Priolo Earthquake Fault Zones and require specific geological investigations prior to development to reduce the threat to public health and safety and minimize the loss of life and property posed by earthquake-induced ground failure. The Limits of Work are not within an Alquist-Priolo Earthquake Fault Zone, and no known active or potentially active faults exist on the site.10 Therefore, the risk of surface fault rupture at the Limits of Work is considered low.

Ground Shaking

Ground shaking is a general term that refers to all aspects of motion on the Earth's surface resulting from an earthquake and normally the major cause of damage in seismic events. The extent of ground shaking is controlled by the magnitude and intensity of the earthquake, the distance from the epicenter, and local geologic conditions. The Modified Mercalli Intensity (MMI) Scale is the most commonly used scale for measurement of the subjective effects of earthquake intensity. The MMI values range from I (earthquake not felt) to XII (damage nearly total); intensities ranging from VI to XII can cause slight to significant structural damage, as described in Table 3.7-3.[11]

11 California Geological Survey. 2002. *How Earthquakes and Their Effects Are Measured*. Note 32.

Table 3.7-3. Modified Mercalli Intensity (MMI) Scale

MMI Value	Effects of Earthquake Intensity
I	Not felt, except by a very few under especially favorable circumstances.
II	Felt by only a few persons at rest, especially on upper floors of buildings. Delicately suspended objects may swing.
III	Felt quite noticeably indoors, especially on upper floors of buildings; many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibration is like the passing of a truck. Duration estimated.
IV	During the day, felt indoors by many; outdoors, by few. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Felt by nearly everyone; many awakened. Some dishes, windows, etc., broken; a few instances of cracked plaster and unstable objects overturned. Disturbances to trees, poles, and other tall objects sometimes noticed. Pendulum clocks may stop.
VI	Felt by all; many frightened and run outdoors. Some heavy furniture moved; a few instances of fallen plaster or damaged chimneys. Damage slight.
VII	Everybody runs outdoors. Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures and considerable in poorly built or badly designed structures. Some chimneys broken. Noticed by persons driving motor cars.
VIII	Damage slight in specially designed structures and considerable in ordinary substantial buildings, with partial collapse; great in poorly built structures. Panel walls thrown out of frame structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned. Sand and mud ejected in small amounts. Changes in well water. Persons driving motor cars disturbed.
IX	Damage considerable in specially designed structures and well-designed frame structures thrown out of plumb; great in substantial buildings, with partial collapse. Buildings shifted off foundations. Ground cracked conspicuously. Underground pipes broken.
X	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations and ground badly cracked. Rails bent. Landslides considerable from river banks and steep slopes. Shifted sand and mud. Water splashed (slopped) over banks.
XI	Few, if any, (masonry) structures remain standing. Bridges destroyed. Broad fissures in ground. Underground pipelines completely out of service. Earth slumps, and land slips in soft ground. Rails bent greatly.
XII	Damage total. Practically all works of construction are damaged greatly or destroyed. Waves seen on ground surface. Lines of sight and level are distorted.

Source: California Geological Survey. 2002. *How Earthquakes and Their Effects Are Measured*. Note 32.

Due to the proximity of active faults, the Limits of Work could experience strong to violent ground shaking in the event of an earthquake.[12] The mapping of earthquake shaking scenarios by the Association of Bay Area Governments indicates that a large earthquake would produce very strong shaking in the vicinity of the Limits of Work (MMI VII).[13]

Liquefaction

Liquefaction is the temporary transformation of loose, saturated granular sediments from a solid state to a liquefied state as a result of seismic ground shaking. In the process, the soil undergoes a transient loss of strength, which commonly causes ground displacement or ground failure to occur. Because saturated soils are a necessary condition for liquefaction, soil layers in areas where the groundwater table is near the surface have higher liquefaction potential than those in which the groundwater table is at greater depths. The potential for liquefaction-induced ground failure (e.g., loss of bearing strength, ground fissures, sand boils) depends on the thickness of the liquefiable soil layer relative to the thickness of the overlying non-liquefiable material. The Limits of Work are mapped within a liquefaction hazard zone as designated by the CGS seismic hazard zone map for the area titled State of California Seismic Hazard Zones, Mountain View Quadrangle, Official Map, released October 18, 2006.[14]

Site-specific analysis indicates that isolated layers of liquefiable soils varying in thickness from approximately 2 to 6 feet are present at the Limits of Work between depths of 5 and 49 feet bgs. The potentially liquefiable soil layers underlying the Limits of Work are not continuous. Liquefaction-induced settlement can occur during a seismic event, when the loose, granular soils can lose their strength and densify, leading to building tipping or ground failure. Modelling suggests that liquefaction-induced settlement of these layers could be on the order of 0.5 to 2 inches, with up to 1.5 inches of differential (i.e., unequal) settlement.

Lateral Spreading

Lateral spreading is a form of horizontal displacement of soil toward an open channel or other "free" face, such as an embankment or excavation boundary. In a lateral spread failure, a layer of ground at the surface is carried on an underlying layer of liquefied material over a nearly flat surface toward the free face. The lateral spreading hazard tends to mirror the liquefaction hazard for an area, assuming a free face is nearby. As the Limits of Work are approximately 4,000 feet east of Stevens Creek (the nearest free face) and the potentially liquefiable soil layers underlying the Limits of Work are not continuous, the potential for lateral spreading at the Limits of Work is considered low.

Seismic Settlement

Seismic settlement (also referred to as *cyclic densification*) can occur when non-saturated, cohesionless sand or gravel soil is densified by earthquake vibrations. When the degree of cyclic densification varies, based on different soil types, differential (i.e., unequal) settlement may occur, which can result in greater damage to structures compared to relatively equal settlement. Site-specific analysis of subsurface conditions indicates that soil above the groundwater table is predominantly medium stiff to hard clay; therefore, the potential for seismic densification is considered low.

[14] Langan. 2023. *Preliminary Geotechnical Evaluation, Moffett Field NASA Research Park Master Planning Phase Mountain View, California*. March 14.

Static Settlement and Subsidence

Static settlement is the lowering of the land surface elevation as a result of loading (i.e., placement of heavy loads, typically fill material or structures), which often occurs with the development of a site. Static settlement occurs when buildings or other improvements are built on low-strength subsurface materials such as compressible soils. Differential settlement can occur when buildings or other improvements straddle the boundary between different types of subsurface materials (e.g., a boundary between native material and/or new engineered fill or a boundary between bedrock and soil). Although static settlement generally occurs slowly enough that its effects are not dangerous to inhabitants, it can cause significant damage to buildings and other improvements over time.

Subsidence is the lowering of the land-surface elevation. The mechanism for subsidence is generally related to groundwater pumping and subsequent consolidation of loose aquifer sediments. Subsidence may also be related to static settlement. The primary hazards associated with subsidence are increased flooding hazards and damage to underground utilities as well as aboveground structures. Other effects of subsidence include changes in the gradients of stormwater and sanitary sewer drainage systems for which the flow is gravity driven. Minor subsidence and recovery due to seasonal variation in groundwater levels is considered elastic subsidence. Historical groundwater pumping in the Santa Clara Plain resulted in a decline of groundwater levels by as much as 200 feet. Fluid pressure in the aquifers was reduced, resulting in the compression of fine-grained materials (e.g., clays) and a broad sagging of the land surface. Approximately 6 feet of inelastic (permanent) subsidence was observed in the vicinity of the Limits of Work between 1934 and 1967. Significant inelastic subsidence in the vicinity of the Limits of Work was essentially halted around 1970 through the Santa Clara Valley Water District's expanded conjunctive management programs, which allowed groundwater levels to recover substantially. Some amount of elastic (temporary) subsidence occurs annually in response to seasonal pumping.[15]

Expansive Soils

Expansion and contraction of soil volume can occur when expansive soils undergo alternating cycles of wet conditions (causing swelling) and dry conditions (causing shrinking). During these cycles, the volume of the soil changes markedly. Shrink-swell potential is influenced by the amount and type of clay minerals present and measured by the percent change of the soil volume. Shrink-swell potential is also influenced by the location of the soils; soils below the groundwater table maintain a steady moisture content and therefore would not be subject to shrink-swell effects. As a consequence of volume changes due to expansive soils, structural damage to buildings and infrastructure can occur if potentially expansive soils are not considered in the design and during construction. The near-surface clay at the Limits of Work have a high expansion potential.[16]

15 Santa Clara Valley Water District. 2021. *Groundwater Management Plan for the Santa Clara and Llagas Subbasins*. November.

16 Langan. 2023. *Preliminary Geotechnical Evaluation, Moffett Field NASA Research Park Master Planning Phase Mountain View, California*. March 14.

Landslide Hazards

The Limits of Work are relatively flat, with no significant slopes on or near the site. The Limits of Work are not located within a CGS-designated Landslide Hazard Zone. The nearest Landslide Hazard Zone is approximately 5 miles south of the Limits of Work.[17]

Paleontological Resources

The Paleontological Resources Study Area is located on Quaternary alluvium of the Santa Clara Valley (Q).[18] The alluvial deposits are estimated to extend to depths of a thousand feet or more.[19] As the maximum depth of construction is 25 feet bgs, construction would disturb only the Quaternary alluvium and would not disturb any geologic unit underlying this unit.[20]

Quaternary Alluvium of the Santa Clara Valley (Q)

Pleistocene vertebrate fossils have been found from multiple localities in Quaternary alluvium across the Santa Clara Valley, including Lawrence Expressway East, San José; Santa Clara Valley Water District lands of the Guadalupe River in San José; Sunnyvale Sewer, Sunnyvale; Calabaza Creek, Sunnyvale; and Milpitas, as well as multiple localities farther north. All of these fossil localities occur in units that have been mapped as surficial Holocene deposits.[21] Radiocarbon dating of the mapped Holocene sediments where the Pleistocene remains were found shows Pleistocene age for two of these finds (11 feet and 30 feet below ground surface); for the others, no dating was performed. Some of these finds may have washed down from the mountains and been deposited in Holocene waterways, but the two radiocarbon-dated finds very likely originated where they were found. These occurrences "demonstrate that older sediments and fossils (more than 10 thousand years before present) occur at or near the surface in these areas," particularly because the amount, association, and orientation of the fossils from these localities indicate that the sediments in which they occur had not been reworked through subsequent geologic or artificial processes.[22] Accordingly, Pleistocene alluvium may be more widespread and shallower in the Santa Clara Valley than was previously thought, and Pleistocene fossils resources are very likely present in the Santa Clara Valley below units mapped as Holocene alluvium. Vertebrate fossils documented include extinct species of mammoth, bear, horse, bison, and camel.

3.7.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance. For the purposes of CEQA, UC Berkeley elected to use the Santa Clara Valley Urban Runoff Pollution Prevention Program for the analysis of geology, soils, and paleontological resources associated with the project.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies. For the purposes of NEPA, NASA has elected to apply the standards identified in the California Building Code, Seismic Hazards Mapping Act, California Geological Survey (CGS)-designated Liquefaction Hazard Zone, State Water Resources Control Board's Construction General Permit, and Santa Clara Valley Urban Runoff Pollution Prevention Program for the analysis of geology, soils, and paleontological resources associated with the project.

This section summarizes plans, policies, and regulations considered in the analysis.

3.7.3.1 Federal Regulations

National Earthquake Hazards Reduction Program

The National Earthquake Hazards Reduction Program (NEHRP) agencies pursue the goals of the program through collaboration with each other and numerous partners. In addition to other federal agencies, program partners include state and local governments, universities, research centers, professional societies, trade associations and businesses, as well as associated councils, commissions and consortia.

NEHRP's work encompasses research, development and implementation activities. Program research helps to advance our understanding of why and how earthquakes occur and impact the natural and built environments. The program develops strategies, tools, techniques, and other measures that can reduce the adverse effects of earthquakes and facilitates and promotes implementation of these measures, thereby strengthening earthquake resilience among at-risk communities.

3.7.3.2 State Regulations

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act was signed into California law on December 22, 1972, to mitigate the hazard of surface faulting to structures for human occupancy.

The act in its current form has three main provisions:

1. It directs the state's California Geological Survey agency (then known as the California Division of Mines and Geology) to compile detailed maps of the surface traces of known active faults. These maps include both the best known location where faults cut the surface and a buffer zone around the known trace(s);
2. It requires property owners (or their real estate agents) to formally and legally disclose that their property lies within the zones defined on those maps before selling the property; and
3. It prohibits new construction of houses within these zones unless a comprehensive geologic investigation shows that the fault does not pose a hazard to the proposed structure.

The act was one of several that changed building codes and practices to improve earthquake safety. These changes are intended to reduce the damage from future earthquakes.

Seismic Hazard Mapping Act

The Seismic Hazards Mapping Act (SHMA) of 1990 (Public Resources Code [PRC] Chapter 7.8, Section 2690–2699.6) directs the Department of Conservation, California Geological Survey, to identify and map areas prone to earthquake hazards of liquefaction, earthquake-induced landslides and amplified ground shaking.

California Building Standards Code

The California Building Standards Code is the building code for California, and Title 24 of the California Code of Regulations (CCR). It is maintained by the California Building Standards Commission, which is granted the authority to oversee processes related to the California building codes by California Building Standards Law. The California building codes under Title 24 are established based on several criteria: standards adopted by states based on national model codes, national model codes adapted to meet California conditions, and standards passed by the California legislature that address concerns specific to California.

Government Codes for Specific Building Types

The California Building Standards Code (CBC) is the building code for California and Title 24 of the CCR. It is maintained by the California Building Standards Commission, which is granted the authority to oversee processes related to the California building codes by California Building Standards Law. The CBC is updated every 3 years and provides minimum standards to protect property and public safety by regulating the design and construction of excavations, foundations, building frames, retaining walls, and other building elements to mitigate the effects of seismic shaking and adverse soil conditions. The CBC also contains provisions for earthquake safety based on factors including occupancy type, the types of soil and rock on-site, and the strength of ground shaking with specified probability of occurring at a site.

California PRC Sections 5097.5 and 30244

PRC Section 5097.5 prohibits the removal, destruction, injury, or defacement of archaeological and paleontological features on any lands under the jurisdiction of state or local authorities.

PRC Section 30244 states that where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required.

California Division of Occupational Safety and Health

The Division of Occupational Safety and Health of California (DOSH, but more commonly known as Cal/OSHA) is an agency of the Government of California established by the California Occupational Safety and Health Act of 1973. Construction activities, such as excavation, shoring, and trenching, are subject to occupational safety standards as specified in California Division of Occupational Safety and Health regulations in the CCR, Title 8.

University of California Seismic Safety Policy

The purpose of the University of California Seismic Safety Policy is to provide an acceptable level of earthquake safety for students, employees, and the public who occupy University Facilities located in California. For structures located in other states or outside the United States, the Responsible Official must take reasonable steps to manage the seismic life safety risk, if any, and comply with the applicable building code.

3.7.3.3 Local Regulations

Santa Clara Valley Urban Runoff Pollution Prevention Program

The Santa Clara Valley Urban Runoff Pollution Prevention Program is an association of 13 cities and towns in Santa Clara Valley, the County of Santa Clara, and the Santa Clara Valley Water District that share a common NPDES municipal stormwater permit to discharge stormwater to South San Francisco Bay. The program and member agencies implement pollution prevention, source control, monitoring, and outreach programs aimed at reducing pollution in stormwater runoff, protecting water quality, and protecting beneficial uses of San Francisco Bay and Santa Clara Valley creeks and rivers. The program also promotes valuing stormwater as an important resource. Since 1993, the program and member agencies have received a variety of national awards in recognition of their programs and efforts.

3.7.4 CEQA Findings

The following sections describe the environmental impacts of the proposed project on geology, soils, and paleontological resources in accordance with CEQA. The sections describe the thresholds used to determine whether an impact would be significant and methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts on geology, soils, and paleontological resources in accordance with NEPA is discussed separately in Section 4.5.7, *Geology, Soils, and Paleontological Resources*, in Chapter 4, *Environmental Impact Statement.*

3.7.5 Thresholds of Significance

In accordance with Appendix G of the State CEQA Guidelines, the project would have the potential to have a significant effect on geology, soils, and paleontological resources if it would result in any of the conditions listed below.

Would the project:

- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
    - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault.
    - Strong seismic ground shaking.
    - Seismic-related ground failure, including liquefaction.
    - Landslides.
- Result in substantial soil erosion or the loss of topsoil?
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?
- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of wastewater?
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to geology and soils?

3.7.6 Methods for Analysis

3.7.6.1 Geology, Soils, and Seismicity

The Preliminary Geotechnical Evaluation (Appendix 3.7-1) was prepared to provide preliminary evaluation of the Limits of Work and identify potential geotechnical issues associated with the various proposed construction and building types and to develop preliminary conclusions and recommendations regarding appropriate foundation types, design parameters, and seismic coefficients for project development. The Preliminary Geotechnical Evaluation provides the information that supports the analysis and impact conclusions related to geology, soils, and paleontology.

3.7.6.2 Paleontological Resources

The fossil-yielding potential of geologic units in a particular area depends on the geologic age and origin of the units as well as on the processes they have undergone, both geologic and anthropogenic.[23] The methods used to analyze potential impacts on paleontological resources and develop mitigation for the identified impacts involved the following steps:

- Identify the geologic units in the Paleontological Resources Study Area.
- Evaluate the potential of the identified geologic units to contain significant fossils (their *paleontological sensitivity*).
- Identify the geologic units that would be affected by the project, based on proposed depth of excavation—either at the ground surface or below the ground surface, defined as at least 5 feet bgs.
- Assess the likelihood of the geologic units affected by the proposed project containing scientifically important, nonrenewable paleontological resources that could be directly affected.
- Identify and evaluate impacts on paleontologically sensitive geologic units as a result of construction and operation that involve ground disturbance.
- Evaluate impact significance.
- According to the identified degree of sensitivity, formulate and implement measures to mitigate potential impacts.

The potential of the proposed project to affect paleontological resources relates to ground disturbance. Ground disturbance caused by the proposed project would take place only during construction phases; therefore, this impact analysis addresses construction impacts.

To identify the geologic units in the Paleontological Resources Study Area, the *Geologic Map of the San Francisco-San José Quadrangle, California* was consulted.[24] The Paleontological Resources Study Area is located on Quaternary alluvium of the Santa Clara Valley (Q).[25] Pleistocene vertebrate fossils have been found from multiple localities in Quaternary alluvium across the Santa Clara Valley, indicating the potential for paleontological resources.

The Impact Mitigation Guidelines Revisions Committee of the Society of Vertebrate Paleontology (SVP) has published standard guidelines[26] for the investigation, collection, preservation, and cataloging of fossil-bearing sites (SVP Guidelines and defines the level of potential as one of four sensitivity categories for sedimentary rocks: High, Undetermined, Low, and No Potential.[27]

---

23 *Anthropogenic* means caused by human activity.

26 Society of Vertebrate Paleontology. 2010. *Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources.* Available: https://vertpaleo.org/wp-content/uploads/2021/01/SVP_Impact_Mitigation_Guidelines.pdf. Accessed: September 11, 2025.

27 Ibid.

Based on the scientific literature,[28] each geologic unit in the Paleontological Resources Study Area was assigned a paleontological sensitivity according to the SVP Guidelines. To evaluate impacts on paleontologically sensitive geologic units as a result of the proposed project, geologic mapping was used to identify the geologic unit(s) that would be disturbed by construction-related ground-disturbing activities with respect to the location of geologic units with high potential and undetermined potential.

Paleontological Sensitivity of Geologic Units at the Paleontological Resources Study Area

The paleontological sensitivity of the geologic units exposed at ground surface in the Paleontological Resources Study Area is shown in Table 3.7-4.

Table 3.7-4. Geologic Units in the Paleontological Resources Study Area and Paleontological Sensitivity

Symbol	Geologic Unit	Epoch	Paleontological Sensitivity [a]	Notes
Q	Alluvium[29]	Holocene	High	Quaternary units are generally too young to contain fossils;[b] however, as recent research suggests that some Quaternary alluvium of the Santa Clara Valley may be more paleontologically sensitive than previously recognized,[30] this analysis takes a conservative approach and designates the unit as having high potential.

Notes:

a. Based on SVP Guidelines[31].

b. Geologic units younger than 5,000 years old are not generally considered old enough to contain fossils (Wagner et al. 1991).

3.7.7 Impacts Not Evaluated in Detail

Soils Incapable of Adequately Supporting the Use of Septic Tanks or Alternative Waste Water Disposal Systems

The proposed project would connect to the existing sewer and stormwater collection and treatment system. Only the CEQA Proposed Project includes the Water Reuse Facility Option; the facility would process all the CEQA Proposed Project's wastewater and divert water from wastewater disposal systems. The facility would produce recycled water to serve the proposed buildings and irrigated

areas; the facility is not considered an alternative wastewater system. The proposed project would not use a septic or alternative water disposal system, resulting in no impact. This topic is not evaluated further.

3.7.8 Impacts and Mitigation Measures

Impact CEQA-GEO-1: Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

a) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault.

b) Strong seismic ground shaking.

c) Seismic-related ground failure, including liquefaction.

d) Landslides.

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	GEO-1. Design-Level Geotechnical Investigation	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Rupture of a Known Earthquake Fault

As discussed under *Surface Fault Rupture* in Section 3.7.2.2, *Limits of Work*, the Limits of Work are not within a Alquist-Priolo Earthquake Fault Zone and no known active or potentially active faults exist on the Limits of Work. Therefore, fault rupture at the Limits of Work during construction or operation is highly unlikely. This impact would be less than significant.

Ground Shaking and Liquefaction

As discussed under *Ground Shaking* in Section 3.7.2.2, *Limits of Work*, the Limits of Work is located in a seismically active region and due to the proximity of active faults could experience strong to violent ground shaking in the event of an earthquake. Ground shaking during construction and operation of the proposed project could damage structures and increase the risk of loss, injury, or death for occupants of the structures.

As discussed under *Liquefaction* in Section 3.7.2.2, *Limits of Work*, the Project Site is located within a California Geological Survey (CGS)-designated Liquefaction Hazard Zone.[32] Liquefaction-induced settlement on the order of 0.5 to 2 inches (with up to 1.5 inches of differential settlement) could occur at the Limits of Work.[33] Settlement due to liquefaction could damage foundations and utilities, increasing the risk of loss, injury, or death for occupants of the Limits of Work.

The risk to structures and improvements from seismic ground shaking and liquefaction is reduced through adherence to the design and materials standards set forth in the California Building Code However, based on the above, the CEQA Proposed Project would have a potentially significant impact related to ground shaking and liquefaction before mitigation.

The Preliminary Geotechnical Evaluation provides preliminary recommendations to address seismic ground shaking and liquefaction, including preliminary recommendations for ground improvements and various foundation design options, and deep foundations.

Landslides

Construction and Operation

As discussed under *Landslide Hazards* in Section 3.7.2.2, *Limits of Work*, the Limits of Work are relatively flat and is not located within a CGS-designated Landslide Hazard Zone. The nearest area of landslide risk is approximately five miles south of the Limits of Work. Accordingly, the construction and operation of the CEQA Proposed Project would have no impact related to landsliding.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

Once site development plans are final, the Project Proponent or its contractor(s) shall coordinate the preparation of a design-level geotechnical investigation by a licensed geotechnical engineer. The design-level investigation findings shall be used to address all the geotechnical concerns described in the *Preliminary Geotechnical Evaluation, Moffett Field NASA Research Park, Master Planning Phase, Mountain View, California*. The recommendations of the *Preliminary Geotechnical Evaluation, Moffett Field NASA Research Park, Master Planning Phase, Mountain View, California* and any recommendations included in the design-level geotechnical investigation for the project shall be incorporated into all applicable design and engineering plans including, but not limited to, site preparation, grading, fill placement, foundations, pavement design, seismic design, etc. Because the Limits of Work are in a California Geological Survey-designated Liquefaction Hazard Zone, the design-level geotechnical investigation must include recommendations to mitigate seismic hazards in accordance with the guidelines of California Geological Survey Special Publication 117A. Prior to the issuance of permits by NASA for the proposed project, a qualified geotechnical expert shall review the design and engineering plans to verify the recommendations have been addressed and incorporated. NASA ARC EMD will then review the expert's findings and confirm that input has been addressed

[32] Langan. 2023. Preliminary Geotechnical Evaluation, Moffett Field NASA Research Park Master Planning Phase Mountain View, California. March 14.

[33] Ibid.

Significance after Mitigation

Impacts related to seismic ground shaking and liquefaction would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project with the Variant would not change the basic characteristic of the CEQA Proposed Project. The CEQA Proposed Project with the Variant would be constructed and operated within the same project footprint. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Significance after Mitigation

Impacts related to seismic ground shaking and liquefaction would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristic of the CEQA Proposed Project. The CEQA Reduced Density Alternative would be constructed and operated within the same project footprint. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Significance after Mitigation

Impacts related to seismic ground shaking and liquefaction would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical

Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative with the Variant would not change the basic characteristic of the CEQA Proposed Project. The CEQA Reduced Density Alternative would be constructed and operated within the same project footprint. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Significance after Mitigation

Impacts related to seismic ground shaking and liquefaction would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

Impact CEQA-GEO-2: Would the project result in substantial soil erosion or the loss of topsoil?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

The CEQA Proposed Project would include ground-disturbing activity, including excavation and grading, that could result in soil erosion or the loss of topsoil. The CEQA Proposed Project would include the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP),

including, but not limited to, the following best management practices: employee training, erosion and sediment controls, good housekeeping, material handling and waste management, preventive maintenance, quality assurance and recordkeeping, and spill and leak prevention and response. Therefore, construction of the CEQA Proposed Project would result in less-than-significant impacts related to erosion or loss of topsoil.

Operation

The CEQA Proposed Project would increase impervious surface area to approximately 79 percent, a 9 percent increase over existing conditions. The Limits of Work would be built out with landscaped areas, trees, shrubs, and manicured lawn, along with the buildings and pavement. The built-out nature of the proposed project would minimize the potential for post-development erosion. In addition, as part of the proposed project, swale and riprap would be installed at the eastern diked marsh outfall and typical maintenance activities at the eastern diked marsh outfall would include removal of accumulated sediment, removal of trash and debris to maintain storage capacity, vegetation control, and inspection and repair of the embankments and dewatering devices. Therefore, operation and maintenance of the CEQA Proposed Project would result in less-than-significant impacts related to erosion or loss of topsoil.

Mitigation Measures

No mitigation is required for this impact.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project with the Variant would not change the basic characteristic of the CEQA Proposed Project. The Variant would require similar ground-disturbing activities, including excavation and grading, which could result in soil erosion or the loss of topsoil. As described for the CEQA Proposed Project, the Variant would include the development and implementation of a SWPPP. Operation of the Variant would also include landscaped areas, buildings, and pavements, which would minimize the potential for post-development erosion. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristic of the CEQA Proposed Project. The CEQA Reduced Density Alternative would require similar ground-disturbing activities, including excavation and grading, which could result in soil erosion or the loss of topsoil. As described for the CEQA Proposed Project, the CEQA Reduced Density Alternative would include the development and implementation of a SWPPP. Operation of the CEQA Reduced Density Alternative would also include landscaped areas, buildings, and pavements, which would minimize the potential for post-development erosion. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative with the Variant would not change the basic characteristic of the CEQA Proposed Project. The Variant would require similar ground-disturbing activities, including excavation and grading, which could result in soil erosion or the loss of topsoil. As described for the CEQA Proposed Project, the CEQA Reduced Density Alternative with the Variant would include the development and implementation of a SWPPP. Operation of the CEQA Reduced Density Alternative with the Variant would also include landscaped areas, buildings, and pavements, which would minimize the potential for post-development erosion. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

Impact CEQA-GEO-3: Would the project be located on a geologic unit or soil that is unstable, or that would become unstable, as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	GEO-1. Design-Level Geotechnical Investigation HAZ-1. Implement the Environmental Issues Management Plan	Less than Significant with Mitigation
CEQA Proposed Project No Student/Faculty Housing Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Potential impacts related to liquefaction are discussed under Impact GEO-1. As discussed under *Lateral Spreading* in Section 3.7.2.2, *Limits of Work*, the nearest free face is approximately 4,000 feet from the Limits of Work, and the potentially liquefiable soil layers underlying the Project Site are not

continuous, the potential for lateral spreading would be less than significant. As discussed under *Landslide Hazards* in Section 3.7.2.2, *Limits of Work*, the Limits of Work are relatively flat and located approximately 5 miles from the nearest Landslide Hazard Zone. Therefore there would be no impact related to landslide hazards.

The Preliminary Geotechnical Evaluation indicates that static and seismic settlement could occur at the Limits of Work. The CEQA Proposed Project would have a potentially significant impact related to settlement before mitigation. Settlement amounts vary depending on foundation system type, final building loads, the presence of highly expansive near-surface soil, liquefaction-induced settlement, and the presence of compressible soil. The Preliminary Geotechnical Evaluation indicates that settlement would affect various aspects of the project, including the foundation design, utilities, streets, building entrances, and sidewalks; however, Preliminary Geotechnical Evaluation also provides preliminary recommendations to deal with and reduce risks associated with settlement at the Limits of Work, such as deep foundations and the use of precast, pre-stressed concrete piles, drilled displacement piles, or drilled displacement columns.

Construction of the proposed project would require excavation up to a maximum depth of 25 feet, which is below the historic groundwater level of 5 feet; therefore, shoring and dewatering may be required to restrain the sidewalls of the excavations laterally, ensuring that they would not collapse, and limit the movement of adjacent improvements. Appropriate shoring that meets applicable regulatory standards will be specified in the detailed construction documents prepared for the proposed project. The Preliminary Geotechnical Evaluation includes recommendations for temporary shoring.

Operation of the proposed project would not create new significant loads that could trigger additional settlement or unstable soil conditions.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Impacts related to settlement would be less than significant with implementation of Mitigation Measure GEO-1, which would require the preparation of a design-level geotechnical investigation, and implementation of Mitigation Measure HAZ-1, which would require ongoing monitoring and remediation during dewatering activities. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project with the Variant would not change the basic characteristic of the CEQA Proposed Project. As the Variant share the same location with CEQA Proposed Project, it would have the same impacts related to potentially unstable geologic units and soils. As described for the CEQA Proposed Project, the risk of lateral spreading for the Variant would be less than significant. There would be no impact related to landsliding risk. Other risks related to unstable geologic units such as settlement would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Impacts related to settlement would be less than significant with implementation of Mitigation Measure GEO-1, which would require the preparation of a design-level geotechnical investigation, and implementation of Mitigation Measure HAZ-1, which would require ongoing monitoring and remediation during dewatering activities. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristic of the CEQA Proposed Project. As the CEQA Reduced Density Alternative would share the same location with CEQA Proposed Project, it would have the same impacts related to potentially unstable geologic units and soils. As described for the CEQA Proposed Project, the risk of lateral spreading for the CEQA Reduced Density Alternative would be less than significant. There would be no impact related to landsliding risk. Other risks related to unstable geologic units such as settlement would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Impacts related to settlement would be less than significant with implementation of Mitigation Measure GEO-1, which would require the preparation of a design-level geotechnical investigation, and implementation of Mitigation Measure HAZ-1, which would require ongoing monitoring and remediation during dewatering activities. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative with the Variant would not change the basic characteristic of the CEQA Proposed Project. As the Variant would share the same location with CEQA Proposed Project, it would have the same impacts related to potentially unstable geologic units and soils. As described for the CEQA Proposed Project, the risk of lateral spreading for the Variant would be less than significant. There would be no impact related to landsliding risk. Other risks related to unstable geologic units such as settlement would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Impacts related to settlement would be less than significant with implementation of Mitigation Measure GEO-1, which would require the preparation of a design-level geotechnical investigation, and implementation of Mitigation Measure HAZ-1, which would require ongoing monitoring and remediation during dewatering activities and that protocols be implemented that would address potential exposure to impacted groundwater resulting from project implementation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

Impact CEQA-GEO-4: Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	GEO-1. Design-Level Geotechnical Investigation	Less than Significant with Mitigation
CEQA Proposed Project No Student/Faculty Housing Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

As discussed under *Expansive Soils* in Section 3.7.2.2, *Limits of Work*, the near-surface clay underlying the Limits of Work have a high expansion potential. Expansive soils have the potential to damage proposed foundations/floor slabs, utilities, and pavement due to moisture fluctuations if appropriate engineering is not incorporated into the project design. Potential causes of moisture fluctuations in soil could include drying during construction as well as subsequent wetting from rain, capillary rise, landscape irrigation, poor drainage, and plant selection. Therefore, impacts related to expansive soils would be potentially significant before mitigation.

The Preliminary Geotechnical Evaluation provides preliminary recommendations including the design and construction of new foundations, exterior slabs, and concrete flatwork to resist the effects of the expansive soil. The effects of expansive soils can be mitigated by moisture conditioning the expansive soil, providing select, non-expansive fill below the flatwork and other at-grade improvements, and providing additional reinforcing steel.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Significance after Mitigation

Impacts related to expansive soil would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the

recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project with the Variant would not change the basic characteristic of the CEQA Proposed Project. The Variant would be constructed and operated within the same project footprint and would therefore be subject to the same risks related to underlying expansive soils. As described for the CEQA Proposed Project, impacts related to expansive soils would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Significance after Mitigation

Impacts related to expansive soil would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristic of the CEQA Proposed Project. The CEQA Reduced Density Alternative would be constructed and operated within the same project footprint and would therefore be subject to the same risks related to underlying expansive soils. As described for the CEQA Proposed Project, impacts related to expansive soils would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Significance after Mitigation

Impacts related to expansive soil would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

Construction and Operation

The CEQA Reduced Density Alternative with the Variant would not change the basic characteristic of the CEQA Proposed Project. The Variant would be constructed and operated within the same project footprint and would therefore be subject to the same risks related to underlying expansive soils. As described for the CEQA Proposed Project, impacts related to expansive soils would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-1. Design-Level Geotechnical Investigation

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-1.

Significance after Mitigation

Impacts related to expansive soil would be less than significant with implementation of Mitigation Measure GEO-1, which requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans.

Impact CEQA-GEO-5: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	GEO-2. Paleontological Resources Discovery Protocols	Less than Significant with Mitigation
CEQA Proposed Project No Student/Faculty Housing Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

The CEQA Proposed Project would be located in an area underlain by Quaternary alluvium of the Santa Clara Valley (Q), which has yielded scientifically important fossil finds at depths greater than 9 feet below surface, including vertebrate remains and is considered highly sensitive to paleontological resources. Disturbance of, damage to, or loss of paleontological resources with high paleontological potential would constitute a significant impact. While most ground disturbing activities would not be deeper than 5 feet bgs and would therefore occur in younger, previously disturbed sediments with a low paleontological sensitivity, some project excavation could reach a maximum depth of 25 feet bgs; therefore, it is possible that this deeper excavation could encounter significant paleontological resources. The CEQA Proposed Project would have a potentially significant impact on significant paleontological resources before mitigation.

Mitigation Measures

Mitigation Measure GEO-2. Paleontological Resources Discovery Protocols

For all ground-disturbing activities within the Limits of Work that extend more than 5 feet below ground surface, the Project Proponent or its contractor(s) shall implement the following protocols. "Ground-disturbing activities" include soil removal, parcel grading, utility trenching, and foundation-related excavation in those areas that extend into previously undisturbed soils:

- A paleontological resources awareness training program by a qualified paleontologist shall be provided to all construction personnel active within the Limits of Work during ground-disturbing activities. The first training shall be provided at the start of each construction phase, prior to the start of ground disturbing activities in a work area for the current construction phase. The training will include relevant information regarding fossils and fossil-bearing formations that may be encountered. The training shall also describe appropriate avoidance and minimization measures for resources that have the potential to be located within the Limits of Work.
- If any paleontological resources are encountered during ground-disturbing activities, the Project Proponent or its contractor(s) shall ensure that activities in the immediate area of the find are halted and inform NASA Ames Research Center Environmental Management Division (NASA ARC EMD). The Project Proponent or its contractor(s) shall retain a qualified paleontologist to evaluate the discovery and recommend appropriate treatment options pursuant to guidelines developed by the Society of Vertebrate Paleontology, including development and implementation of a paleontological resource impact mitigation program by a qualified paleontologist for treatment of the particular resource, if applicable. These measures may include, but not be limited to the following:
    - Salvage of unearthed fossil remains and/or traces (e.g., tracks, trails, burrows);
    - Screen washing to recover small specimens;
    - Preparation of salvaged fossils to a point of being ready for curation (e.g., removal of enclosing matrix, stabilization and repair of specimens, and construction of reinforced support cradles); and
    - Identification, cataloging, curation, and provision for repository storage of prepared fossil specimens.

Significance After Mitigation

Impacts related to paleontological resources would be less than significant with implementation of Mitigation Measure GEO-2, which requires a paleontological resources awareness training program and identifies protocols if any paleontological resources are encountered during ground-disturbing activities.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project with the Variant would not change the basic characteristics of the CEQA Proposed Project and would have a potentially significant impact on significant paleontological resources before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-2. Paleontological Resources Discovery Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-5.

Significance After Mitigation

Impacts related to paleontological resources would be less than significant with implementation of Mitigation Measure GEO-2, which requires a paleontological resources awareness training program and identifies protocols if any paleontological resources are encountered during ground-disturbing activities.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristic of the CEQA Proposed Project and would have a potentially significant impact on significant paleontological resources before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-2. Paleontological Resources Discovery Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-5.

Significance After Mitigation

Impacts related to paleontological resources would be less than significant with implementation of Mitigation Measure GEO-2, which requires a paleontological resources awareness training program and identifies protocols if any paleontological resources are encountered during ground-disturbing activities.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative with the Variant would not change the basic characteristic of the CEQA Proposed Project and would have a potentially significant impact on significant paleontological resources before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GEO-2. Paleontological Resources Discovery Protocols

See discussion for the CEQA Proposed Project under Impact CEQA-GEO-5.

Significance After Mitigation

Impacts related to paleontological resources would be less than significant with implementation of Mitigation Measure GEO-2, which requires a paleontological resources awareness training program and identifies protocols if any paleontological resources are encountered during ground-disturbing activities.

3.7.9 Cumulative Impacts

Cumulative impacts are addressed only for those thresholds that would result in a project-related impact. If the proposed project would result in no impact with respect to a particular threshold, it would not contribute to a cumulative impact. As discussed in Section 3.7.7, *Impacts Not Evaluated in Detail*, the proposed project would result in no impact related to the use of septic tanks or alternative wastewater disposal systems, and no cumulative analysis is required. The discussion of cumulative impacts addresses the topics evaluated in the corresponding project impacts in Section 3.7.8, *Impacts and Mitigation Measures*.

The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Impact Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. The cumulative geographic context for geology and soils is site-specific due to the fact that a project's potential impacts are individual and localized, depending on the Limits of Work, the underlying soils, and the different levels of excavation, cut-and-fill work, and grading. The geographic context for paleontological resources is the full extent of geologic unit, in this case the Quaternary alluvium, with high paleontological sensitivity that underlie the Limits of Work.

Impact CEQA-C-GEO-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to geology or soils? (No Significant Cumulative Impact)

Cumulative development would require various levels of excavation or cut-and-fill, which would affect local geologic conditions. As discussed above, impacts related to geology and soils are generally site-specific and are not cumulative; each cumulative project would be required to go through environmental and regulatory review and comply with local and state building codes. In addition, each cumulative project would also be required to have a site-specific geotechnical investigation performed, which would provide design recommendations to reduce each project's

impacts related to geologic and seismic safety. As discussed above, ground shaking during construction and operation of the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) could damage structures and increase the risk of loss, injury, or death for occupants of the structures. In addition, settlement due to liquefaction could damage foundations and utilities, increasing the risk of loss, injury, or death for occupants of the Project Site. Implementation of Mitigation Measure GEO-1 requires the preparation of a design-level geotechnical investigation. The geotechnical concerns described in the Preliminary Geotechnical Evaluation and the recommendations in the design-level geotechnical investigation would be incorporated into all applicable design and engineering plans. Furthermore, the proposed project would include the development and implementation of a SWPPP and operation would include landscaped areas, buildings, and pavements, which would minimize the potential for post-development erosion. Therefore, because impacts related to geology and soils are generally site-specific, the impacts of the cumulative projects, combined with the proposed project, would not result in a significant cumulative impact related to geology and soils.

Impact CEQA-C-GEO-2: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to paleontological resources? (Less than Cumulatively Considerable with Mitigation)

The geologic unit underlying the Limits of Work is Quaternary alluvium of the Santa Clara Valley (Q), which has high paleontological potential; therefore, cumulative projects on this geologic unit that involve excavation into Quaternary alluvium could affect paleontological resources during ground-disturbing activities. The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would be located in an area underlain by Quaternary alluvium of the Santa Clara Valley (Q), which has yielded scientifically important fossil finds, including vertebrate remains and is considered highly sensitive to paleontological resources. The project involves excavation to a maximum depth of 25 feet bgs; therefore, it is possible that project-related excavation could encounter significant paleontological resources. Therefore, the impacts of cumulative projects, combined with the proposed project, would result in a significant cumulative impact related to paleontological resources.

Implementation of Mitigation Measure GEO-2 requires a paleontological resources awareness training program and identifies protocols if any paleontological resources are encountered during ground-disturbing activities. Therefore, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would not result in a cumulatively considerable contribution to significant environmental impacts on paleontological resources.

3.8 Greenhouse Gas Emissions

3.8.1 Introduction

This section evaluates the potential impacts on greenhouse gas (GHG) emissions that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Project Site as well as the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical study prepared for the proposed project:

- *Berkeley Space Center at NASA Research Park Air Quality, Health Risk Assessment, and Greenhouse Gas Technical Report* (Air Quality, Health Risk, and GHG Technical Report) prepared by ICF, April 2026 (Appendix 3.3-1 of this joint environmental impact report/ environmental impact statement [EIR/EIS]).

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. The NOP/NOI comments pertaining to GHG emissions include the following recommendations by the U.S. Environmental Protection Agency (EPA), Region 9:

- Identify project design features to reduce GHG emissions and increase energy efficiency and reliance on renewable energy. This issue is addressed in Section 3.8.7, *Impacts and Mitigation Measures*, under Impact CEQA-GHG-1, and Section 4.5.8.4, *Environmental Consequences*, under Impact NEPA-GHG-1.
- Identify and quantify sources of carbon dioxide (CO_2) emissions during project construction and operation. This issue is addressed in Section 3.8.7, *Impacts and Mitigation Measures*, under Impact CEQA-GHG-1, and Section 4.5.8.4, *Environmental Consequences*, under Impact NEPA-GHG-1.
- Implement actions to reduce GHG emissions, including Tier 4 Final construction engines, low carbon materials, and compliance with Leadership in Energy and Environmental Design (LEED). This issue is addressed in Section 3.8.7, *Impacts and Mitigation Measures*, under Impact CEQA-GHG-1, and Section 4.5.8.4, *Environmental Consequences*, under Impact NEPA-GHG-1.

Similar to EPA, an individual commenter recommended the project design maximize the use of renewable resources and minimize the use of fossil fuels. Carpenters Union Local 405 also requested analysis and mitigation (if necessary) of construction workers' vehicle trips to and from the Project Site. This issue is addressed under Impact CEQA-GHG-1 and under Impact NEPA-GHG-1 in Chapter 4, *Environmental Impact Statement*, of this joint EIR/EIS.

3.8.2 Affected Environment/Environmental Setting

3.8.2.1 Greenhouse Gases

The principal anthropogenic (human-made) GHGs contributing to global warming are CO_2, methane (CH_4), nitrous oxide (N_2O), and fluorinated compounds, including sulfur hexafluoride,

hydrofluorocarbons (HFCs), and perfluorocarbons. Water vapor, the most abundant GHG, is not included in this list because its natural concentrations and fluctuations far outweigh its anthropogenic sources.

The primary GHGs of concern associated with the proposed project are CO_2, CH_4, N_2O, and HFCs. Additional information on these pollutants is provided in the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. Sulfur hexafluoride and perfluorocarbons are not discussed because these gases are primarily generated by industrial and manufacturing processes, which are not part of the proposed project.

Methods have been set forth to describe emissions of GHGs in terms of a single gas to simplify reporting and analysis. The most accepted method to compare GHG emissions is the global warming potential (GWP) methodology defined in Intergovernmental Panel on Climate Change (IPCC) reference documents. IPCC defines the GWP of various GHG emissions on a normalized scale that recasts all GHG emissions in terms of carbon dioxide equivalent (CO_2e), which compares the gas in question to that of the same mass of CO_2 (CO_2 has a GWP of 1 by definition).

Table 3.8-1 lists the GWP of CO_2, CH_4, N_2O, and HFCs and their lifetimes in the atmosphere. The GWPs are from the IPCC's fourth assessment report (AR4). Common metrics adopted at the 27th United Nations Framework Convention on Climate Change Conference of Parties (COP27) require Parties to use 100-year GWP values from IPCC's fifth assessment report (AR5) in their national GHG reporting by the end of 2024.[1] EPA's most recent national GHG inventory uses the AR5 GWPs.[2] Although national GHG reporting is moving toward use of the AR5 GWPs, this analysis uses the AR4 GWP consistent with statewide GHG reporting.[3]

Table 3.8-1. Lifetimes and Global Warming Potentials of Key Greenhouse Gases

Greenhouse Gas	Global Warming Potential (100 years)	Lifetime (years)
CO_2	1	–
CH_4	25	12
N_2O	298	114
HFCs	124–14,800	1–270

Source: California Air Resources Board. 2025. *GHG Global Warming Potentials*. Available: https://ww2.arb.ca.gov/ghg-gwps. Accessed: April 9, 2025.
CH_4 = methane; CO_2 = carbon dioxide; N_2O = nitrous oxide; HFCs = hydrofluorocarbons.

3.8.2.2 Emissions Inventories

A *GHG inventory* is a quantification of all GHG emissions and sinks in a selected physical and/or economic boundary. Table 3.8-2 outlines the most recent global, national, state, and county GHG inventories. The table also includes inventories for the cities of Mountain View and Sunnyvale, which border the NASA Ames Research Center (ARC) and Project Site, as well as the inventory for the UC Berkeley main campus and NASA ARC.

3.8.2.3 Global Warming and Climate Change

The process known as the *greenhouse effect* keeps the atmosphere near Earth's surface warm enough for the successful habitation of humans and other life forms. The greenhouse effect is created by sunlight that passes through the atmosphere. Some of the sunlight striking Earth is absorbed and converted to heat, which warms the surface. The surface emits a portion of this heat as infrared radiation, some of which is re-emitted back toward the surface by GHGs in the atmosphere, and some of which results in warming of the atmosphere. Human activities that generate GHGs increase the amount of infrared radiation absorbed by the atmosphere, thus enhancing the greenhouse effect and amplifying the warming of Earth.

Increases in fossil fuel combustion and deforestation have exponentially increased concentrations of GHGs in the global atmosphere since the Industrial Revolution.[4] Rising atmospheric concentrations of GHGs in excess of natural levels result in increasing global surface temperatures—a process

[4] Intergovernmental Panel on Climate Change. 2018. *Global Warming of 1.5°C.* Chapter 1, Framing and Context. Summary for Policymakers. M.R. Allen, O.P. Dube, W. Solecki, F. Aragón-Durand, W. Cramer, S. Humphreys, M. Kainuma, J. Kala, N. Mahowald, Y. Mulugetta, R. Perez, M. Wairiu, and K. Zickfeld.

commonly referred to as *global warming*. Higher global surface temperatures, in turn, result in changes to Earth's climate system, including increased ocean temperature and acidity, reduced sea ice, variable precipitation, and increased frequency and intensity of extreme weather events.[5] Large-scale changes to Earth's system are collectively referred to as *climate change.*

The Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS summarizes anticipated changes to the global, statewide, and local climate systems based on the most recent scientific, technical, and socioeconomic information relevant to understanding climate change.

3.8.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance. For the purposes of CEQA, UC Berkeley has elected to use guidance from the Bay Area Air District (Air District) for the analysis of greenhouse gas emissions associated with the project.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies. For the purposes of NEPA, NASA has elected to use guidance from the state and the Air District, supplemented with federal standards, for the analysis of greenhouse gas emissions associated with the proposed project.

Plans, policies, and regulations considered in the analysis of the proposed project's potential impacts related to GHG emissions are identified in the Air Quality, Health Risk, and GHG Technical Report (Appendix 3.3-1 of this joint EIR/EIS). A list of plans, policies, and regulations considered in the analysis is provided below.

- State Legislative Reduction Targets
- Vehicle Efficiency and Zero-Emissions Standards
- Low-Carbon Fuel Standard
- Sustainable Land Use Planning and Vehicle Miles Traveled
- Senate Bill (SB) 100 and 1020

[5] Ibid.

- Building Efficiency and Green Building Design
- Air District Regulations, CEQA Air Quality Guidelines
- Metropolitan Transportation Commission and Association of Bay Area Governments Sustainable Communities Strategy

3.8.4 CEQA Findings

This section describes the environmental impacts of the proposed project on GHG emissions in accordance with CEQA. It describes the thresholds used to determine whether an impact would be significant and methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts on GHG emissions in accordance with NEPA is provided separately in Section 4.5.8, *Greenhouse Gas Emissions*, in Chapter 4, *Environmental Impact Statement*.

3.8.5 Thresholds of Significance

In accordance with Appendix G of the CEQA Guidelines, the proposed project would have the potential to have a significant effect on GHG emissions if it would result in any of the following conditions.

Would the project:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Both conditions are evaluated based on guidance outlined in the Air District's *CEQA Air Quality Guidelines*.[6] The Air District's guidelines do not identify a GHG emission threshold for construction-related emissions. Instead, they recommend that GHG emissions from construction be quantified and disclosed. The Air District further recommends incorporation of best management practices (BMP) to reduce GHG emissions during construction, as feasible and applicable.[7]

The Air District recommends that lead agencies evaluate operational GHG emissions from land use projects consistent with guidance from the California Supreme Court in *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) (62 Cal. 4th 204), which specifies that a project must evaluate its effect on California's efforts to meet the State's long-term climate goals. As the California Supreme Court held in that case, a project that meets the State's long-term climate goals can be found to have a less-than-significant impact on climate change under CEQA. Specifically, if a project contributes a "fair share"[8] toward what will be required to achieve long-term climate goals,

6 Bay Area Air District. 2023. *California Environmental Quality Act Air Quality Guidelines*. April.

7 Ibid.

8 The Air District (2023:6-2) defines *fair share* as the design elements that need to be incorporated into a project to lay the foundation for achieving carbon neutrality by 2045. These design elements are elements that the project has influence or control over. For example, becoming carbon neutral by 2045 will require California's electrical power generators to shift to 100 percent carbon-free energy resources, which is not something that can be controlled through the design of new land use projects and would not be a part of a project's fair share.

then a reviewing agency can find that the impact will not be significant because the project will help to solve the problem of global climate change (62 Cal. 4th 220–223). Applying this approach, the Air District has found that a new land use development project being built today needs to incorporate the design elements shown in Table 3.8-3 to do its fair share toward meeting the Senate Bill (SB) 32 target for 2030 and the goal of carbon neutrality by 2045. If a project incorporates the design elements listed in Table 3.8-3 (Threshold Option A) or is consistent with a local GHG reduction strategy under Section 15183.5 of the State CEQA Guidelines (Threshold Option B), then it will contribute a portion to what will be necessary to achieve California's long-term climate goals (i.e., its fair share) and will not result in a cumulatively considerable contribution to global climate change. If a project does not incorporate the design elements or is not consistent with an applicable local GHG reduction strategy, then it should be found to be a project with a significant climate impact because it will hinder the State's efforts to address climate change.[9]

Table 3.8-3. Air District Operational GHG Thresholds for Land Use Projects

Thresholds for Land Use Projects (Must Include A or B)
A. Projects must include, at a minimum, the following project design elements: 1. Buildings a. The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development). b. The project will not result in any wasteful, inefficient, or unnecessary electrical usage, as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines. 2. Transportation a. Achieve compliance with EV requirements in the most recently adopted version of CALGreen Tier 2. b. Achieve a reduction in project-generated VMT to a level below the regional average, consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent), or meet a locally adopted SB 743 VMT target, reflecting the recommendations provided in OPR's Technical Advisory on Evaluating Transportation Impacts in CEQA: i. Residential projects: 15 percent below existing VMT per capita, ii. Office projects: 15 percent below existing VMT per employee, and iii. Retail projects: no net increase in existing VMT.
B. Projects must be consistent with a local GHG reduction strategy that meets the criteria under State CEQA Guidelines Section 15183.5(b).

Source: Bay Area Air District. 2023. California Environmental Quality Act Air Quality Guidelines. April.
EV = electric vehicle; SB = Senate Bill; VMT = vehicle miles traveled

The Project Site is on federal land within NASA ARC. Neither NASA nor UC Berkeley has a qualified GHG reduction strategy that applies to the Project Site. The proposed project is also outside the planning boundaries of the local climate action plans (Cities of Mountain View and Sunnyvale), and, as such, Threshold Option B is not used. This analysis, therefore, evaluates consistency with the Air District operational threshold for land use projects by comparing this project to Threshold Option A,

Other sources that would not be part of the fair share are vehicle fleet mix and indirect off-site emissions (e.g., methane emissions from wastewater or solid waste).

9 Ibid.

as defined in Table 3.8-3. GHG emissions generated by the proposed project would not be considered significant under CEQA if the following criteria were met:

- Incorporates BMPs to reduce construction emissions
- Consistent with the Air District land use design elements (Threshold Option A in Table 3.8-3)

This analysis also discusses the proposed project's compliance with regulatory programs designed to reduce GHG emissions. Applicable plans adopted for the purpose of reducing GHG emissions are CARB's *2022 Scoping Plan*, MTC's *Plan Bay Area 2050*, and the Air District's *2017 Clean Air Plan*.

3.8.6 Methods for Analysis

This section summarizes the methods used to analyze potential GHG impacts. The Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS, provides additional detail on the analysis, including specific modeling assumptions and outputs.

The GHG analysis uses mobile source emission rates from EMFAC2021 with CARB's off-model adjustments. While CARB has released EMAFC2025 version 2.1.0, the tool was not available at the time the Notice of Preparation was issued for the environmental document. EMFAC2025 also has not yet been approved by EPA. As discussed in Section 3.3.6, *Methods for Analysis*, in Section 3.3, *Air Quality*, Congressional resolutions signed on June 12, 2025, disapproved EPA's decisions to grant California waivers for the ACT, Warranty Phase 1, and Omnibus regulations. Although CARB published factors for removing the effects of these regulations from the ROG, NO_X, and PM emissions rates produced by EMFAC2021, which are used by CalEEMod to estimate mobile-source emissions, equivalent adjustment factors for GHG emissions rates for EMFAC2021 were not developed by CARB. Potential implications of the Congressional resolutions on the GHG emissions analysis are discussed in Section 3.8.7, *Impacts and Mitigation Measures*.

3.8.6.1 Construction

The buildout of the CEQA Proposed Project or CEQA Reduced Density Alternative would occur over four phases, spanning a total of approximately 14 years. Based on current information, it is anticipated that construction would begin, at the earliest, in 2027. However, based on information available at the time of the technical analysis, emissions were quantified assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be the same or lower than under 2026 conditions because of improvements in engine technology and regulations to reduce combustion emissions. Accordingly, the construction analysis reflects a realistic to conservative representation of emissions.

Construction activities have the potential to create GHG emissions through the use of heavy-duty construction equipment, along with construction workers' vehicle trips, on-road truck trips, and consumption of electricity. GHG emissions from construction activities were estimated using the California Emissions Estimator Model (CalEEMod), version 2022, and project-specific construction data (e.g., schedule, equipment, on-site and off-site truck volumes) provided by the project engineering team. The intensity of construction for the CEQA Proposed Project and the CEQA Reduced Density Alternative with or without the Variant would therefore be the same, except for architectural coatings. However, the application of architectural coatings does not result in fugitive GHG emissions. Thus, GHG emissions quantified for the CEQA Proposed Project and the CEQA Reduced Density Alternative are representative of conditions with or without the Variant.

Construction of the Water Reuse Facility (WRF) Option or Central Utility Plant (CUP) Option would require additional off-road equipment and on-road vehicles beyond that required for construction of the CEQA Proposed Project.

3.8.6.2 Operations

Operations would generate GHG emissions from mobile sources, landscaping equipment (area source), electricity consumption (energy source/area source [residential electric fireplace]), water consumption, waste generation, refrigeration and air condition equipment (fugitive source), and emergency generators (stationary source). Emissions from these sources were modeled using CalEEMod, guidance from the Air District,[10] and project-specific operating data provided by the project engineering team, Fehr & Peers,[11] and EKI.[12] As discussed in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, the proposed project would incorporate various sustainability strategies that will minimize potential impacts on air quality. The operational air quality analysis accounts for an all-electric design (i.e., no natural gas); water, energy, and waste conservation measures; and vehicle miles traveled (VMT) benefits from sustainable transportation, as quantified by the project transportation consultants.

Implementation of CEQA Proposed Project or CEQA Reduced Density Alternative would remove 227 existing trees during construction and plant 1,283 new trees. Tree removal results in carbon storage loss and results in long-term reductions in carbon sequestration. Conversely, tree planting would lead to emissions reductions from long-term annual carbon sequestration and storage. Because changes in vegetation (removal and planting) affect GHG emissions over the life of the tree, they are considered as part of the operational emissions analysis. Carbon storage and sequestration from tree removal and planting was modeled using U.S. Department of Agriculture Forest Service's i-Tree Planting Calculator (i-Tree), version 2.7.2.[13]

As described in Section 3.3.6.1, *Mass Emissions Modeling*, in Section 3.3, *Air Quality*, operational modeling was conducted for full buildout. Based on current information, it is anticipated that the first full year of operation would be 2041. However, based on information available at the time of the technical analysis, emissions were quantified assuming project operations would begin in 2040. It is projected that the emissions intensity of some operational sources, such as vehicle operation, in 2041 would be lower than under 2040 conditions because of improvements in engine technology and regulations to reduce combustion emissions. Accordingly, the operations analysis reflects a conservative representation of emissions.

Partial operational emissions were also quantified for the land uses constructed during the first three phases. Emissions were quantified for the first year following completion of construction for each phase and held constant for all future years through 2040. This approach is conservative because annual operational emissions for each phase are likely to decrease each year due to declining emissions rates from deployment of renewable energy and potential improvements in

[13] Trees planted proximate to buildings may achieve GHG reductions from energy savings (e.g., kilowatt hours). The distances of specific trees to individual buildings are not currently known. Accordingly, this analysis only accounts for changes in carbon sequestration associated with tree plantings and removals.

vehicle technologies and emissions controls. As noted above, the emissions results likely are also conservative because the modeling was conducted assuming construction and operations would begin one year sooner than anticipated, based on current information.

3.8.7 Impacts and Mitigation Measures

Impact CEQA-GHG-1: Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	GHG-1. Best Management Practices for Construction-Related GHG Emissions AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction AQ-2. Zero-Emission On-Road Vehicles during Construction TRAN-1. Require a Mitigated TDM Plan that Further Reduces VMT	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Significant and Unavoidable with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

Construction of the CEQA Proposed Project (with or without the CUP Option or WRF Option) would generate GHG emissions through the use of heavy-duty construction equipment, construction workers' vehicle trips, on-road truck trips, and electricity consumption. Emissions from these sources were calculated using the methods described in Section 3.8.6.1, *Construction*, and in the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. However, emissions are not compared to a numeric threshold because the Air District has not adopted construction-related GHG thresholds. As discussed in Section 3.8.5, *Thresholds of Significance*, the significance of construction-generated GHG emissions is qualitatively assessed

based on implementation of BMPs. Uncontrolled construction GHG emissions would be inconsistent with the Air District's recommendation, as discussed further under *Conclusion*.

Table 3.8-4 summarizes the results of the informational emissions modeling for the CEQA Proposed Project. The table presents emissions with and without implementation of Mitigation Measure AQ-1. The mitigation measure is considered because it is required to address air quality impacts, as discussed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impact AIR-2. The construction air quality analysis also requires Mitigation Measures AQ-2 through AQ-4 and GHG-1. Mitigation Measure AQ-3 requires fugitive dust control, and Mitigation Measure AQ-4 requires low-VOC paints. Neither measure would reduce GHG emissions. Although Mitigation Measure AQ-2 would reduce GHG emissions from fossil fuel vehicles, reductions are not specifically quantified because the measure establishes fleetwide performance standards, as opposed to individual vehicle mandates. Thus, construction contractors have flexibility in meeting the standards and can select various combinations of zero-emission vehicles and fossil-fuel vehicles across their fleets, based on commercial availability and cost effectiveness. Mitigation Measure GHG-1 is discussed further in this section, although emissions benefits are not fully quantified in Table 3.8-4. This is because specific details required to quantify emissions reductions from most BMPs are not currently available or known. For example, the measure outlines standards for use of equipment, based on the availability of grid power at the time of construction, which cannot be currently known. Another BMP promotes carpooling, which is something the Project Proponent can encourage but not enforce, and thus, the exact penetration of the BMP is not known. The analysis of Mitigation Measure GHG-1 includes benefits from off-road engine electrification, use of Tier 4 Final engines, and use of renewable diesel. Emissions are presented for each year of construction to capture the sum of emissions from the multiple activity categories occurring within the same year.

Table 3.8-4. Estimated GHG Emissions from Construction of the CEQA Proposed Project (metric tons) [a]

	Unmitigated					With Air Quality Mitigation [b]				
Year	**CO_2**	**CH_4**	**N_2O**	**HFC**	**CO_2e**	**CO_2**	**CH_4**	**N_2O**	**HFC**	**CO_2e**

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.
Note: As noted in Section 3.8.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026.

It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the ROG, NO_X, and PM adjustment factors across all construction air quality analyses for the proposed project resulted in a less than 1 percent increase in affected emissions, due largely to the fact that construction emissions are generated primarily by off-road equipment. It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] Emissions results include implementation of Mitigation Measure AQ-1 (Mitigation Measure AQ-2 is not quantified), which is required to address air quality impacts.

CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; HFCs = hydrofluorocarbons; N_2O = nitrous oxide

Construction of the WRF in 2038 and 2039 or construction of the CUP in 2035 and 2036 would require additional off-road equipment and on-road vehicles beyond what is required for construction of the CEQA Proposed Project, resulting in additional short-term emissions during these years. Tables 3.8-5 and 3.8-6 summarize estimated emissions for the CEQA Proposed Project with the WRF Option and CUP Option, respectively. Tables 3.8-5 and 3.8-6 present emissions with and without implementation of Mitigation Measure AQ-1, which is required to address air quality impacts. Only emissions for those years during which the WRF and CUP would be constructed (i.e., 2038 to 2039 for the WRF Option and 2035 to 2036 for the CUP Option) would differ from the CEQA Proposed Project. However, Tables 3.8-5 and 3.8-6 include emissions for all construction years to enable a total emissions summation.

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.8.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the ROG, NO_X, and PM adjustment factors across all construction air quality analyses for the proposed project resulted in a less than 1 percent increase in affected emissions, due largely to the fact that construction emissions are generated primarily by off-road equipment. It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] The CUP would be constructed in 2035 and 2036. Emissions during all other construction years would be the same as the CEQA Proposed Project; they are included in the table to enable a total emissions summation.

[c] Emissions results include implementation of Mitigation Measure AQ-1 (Mitigation Measure AQ-2 is not quantified), which is required to address air quality impacts.

CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; HFCs = hydrofluorocarbons; N_2O = nitrous oxide

As shown in Table 3.8-4, it is estimated that construction of the CEQA Proposed Project would generate approximately 65,472 metric tons CO_2e over the entire construction period (unmitigated). The emissions generated during construction would result primarily from the use of diesel-powered construction equipment (e.g., excavators) and on-road vehicles (e.g., haul trucks, workers' vehicles).

Construction emissions would cease once construction of the proposed project is complete and, therefore, are considered short term. Construction of the CUP Option or WRF Option would generate slightly more emissions (unmitigated) than the CEQA Proposed Project (66,628 metric tons and 66,378 metric tons (unmitigated), respectively) due to additional equipment and vehicles (see Tables 3.8-5 and 3.8-6).

Operations

Operation of the CEQA Proposed Project (with or without the CUP Option or WRF Option) would generate GHG emissions from mobile, energy, area, water, waste, stationary, and fugitive sources. Tree removal and planting would result in emissions changes from carbon sequestration and storage. Emissions from these sources were quantified according to the methods summarized in Section 3.8.6.2, *Operations*, and the Air Quality, Health Risk, and GHG Technical Report, included as Appendix 3.3-1 of this joint EIR/EIS. However, as discussed in Section 3.8.5, *Thresholds of Significance*, the significance of operations-generated GHG emissions is qualitatively assessed based on consistency with the Air District's land use design elements.

Table 3.8-7 summarizes the results of the informational emissions modeling for the CEQA Proposed Project. Emissions were modeled under full-build conditions, which assumes all buildings developed under the proposed project are fully occupied immediately following construction. Table 3.8-7 presents emissions with and without implementation of Mitigation Measures AQ-6 and TRAN-1. The mitigation measures are considered because they are required to address air quality impacts, as discussed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impact AIR-2 (Mitigation Measure AQ-5 would not reduce operational GHG emissions).

Table 3.8-7 also presents total emissions under the CEQA No Project Alternative (existing conditions, 2024); refer to Table 5-6 in Chapter 5, *Other CEQA Information and Alternatives*, Section 5.5.5.1 CEQA *No-Project/Existing Conditions Alternative*, for additional detail. The net increase in operational emissions of the CEQA Proposed Project under CEQA is determined by subtracting existing (2024) operational emissions from the proposed project's estimated operational emissions at full buildout. Net emissions are not compared to a numeric threshold. As discussed in Section 3.8.5, *Thresholds of Significance*, the significance of operations-generated GHG emissions is qualitatively assessed based on consistency with the Air District's land use design elements.

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.8.6, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. *Methods for Analysis*, CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the adjustment factors across all operational air quality analyses for the proposed project resulted in a less than 1 percent to 22 percent increase in mobile source emissions, depending on the analysis year and pollutant (i.e., ROG, NO_X, or PM). It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] Emissions results include implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts.

[c] Sequestration benefits from the proposed planting of 1,283 trees. Emissions results are annualized over a 40-year tree lifetime.

[d] Refer to Table 5-6 for emissions by source.

[e] Net change is the total project (2041) emissions minus total existing (2024) emissions.

CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; CH_4 = methane; N_2O = nitrous oxide; HFCs = hydrofluorocarbons

Except for stationary and water sources, operational emissions under the CEQA Proposed Project with the WRF Option would be the same as presented in Table 3.8-7 for the CEQA Proposed Project. One additional emergency generator would be maintained to support the WRF. The WRF would also consume a small amount of water for system backwashing/flushing. The generator and additional water consumption would result in 38 metric tons CO_2e per year. When added to unmitigated emissions estimated for the CEQA Proposed Project (Table 3.8-7), operation of the CEQA Proposed Project with the WRF Option would result in 20,111 metric tons CO_2e per year, which is a net change of 19,931 metric tons CO_2e relative to existing conditions. When air quality mitigation is considered, the CEQA Proposed Project with the WRF Option would result in a net change of 18,604 metric tons CO_2e relative to existing conditions.

Operation of the CUP Option would reduce emissions from energy, water consumption, and fugitive sources relative to the CEQA Proposed Project but increase emissions from stationary (i.e., generators) sources. Table 3.8-8 presents estimated operational emissions for the CEQA Proposed Project with the CUP Option under full-build conditions. Table 3.8-8 presents emissions with and without implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts (Mitigation Measure AQ-5 would not reduce operational GHG emissions). Table 3.8-8 includes emissions from mobile, area, waste, and vegetation sources, which would be the same as estimated for the CEQA Proposed Project, to enable a total emissions summation. Table 3.8-8 also presents total emissions under existing (2024) conditions; refer to Table 5-8 for additional detail. Compared to the CEQA Proposed Project, the CUP Option would slightly increase net operational emissions due to operation of the additional standby generator.

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.8.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the adjustment factors across all operational air quality analyses for the proposed project resulted in a less than 1 percent to 22 percent increase in mobile source emissions, depending on the analysis year and pollutant (i.e., ROG, NO_X, or PM). It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] Emissions results include implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts.

[c] Sequestration benefits from the proposed planting of 1,283 trees. Emissions results are annualized over a 40-year tree lifetime.

[d] Refer to Table 5-6 for emissions by source.

[e] Net changes is the total project (2041) emissions minus total existing (2024) emissions.

CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; HFCs = hydrofluorocarbons; N_2O = nitrous oxide

As noted above, the significance of operations-generated GHG emissions is qualitatively assessed based on consistency with the Air District's land use design elements. The Air District's land use design elements are established to ensure that projects meet their fair share contribution and help the State meet its long-term climate goals (SB 32 and AB 1279). These design elements and metrics include prohibiting natural gas infrastructure in the project design, avoiding wasteful use of electricity, promoting electric-vehicle use and charging consistent with CALGreen Tier 2 requirements, and reducing VMT in accordance with the 2022 Scoping Plan. Table 3.8-9 analyzes the consistency of the CEQA Proposed Project (with or without the CUP Option or WRF Option) with the Air District's land use design elements.

Table 3.8-9. CEQA Proposed Project Consistency with the Air District's Land Use Design Elements (Option A)

Sector	Air District Threshold Option A (refer to Table 3.8-3)	Project Consistency
Buildings	a) The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).	**Consistent.** The project would not install any natural gas appliances—rather, the proposed project would use an all-electric design for new building systems (e.g., HVAC, mechanical). Moreover, no new natural gas plumbing would be installed by the proposed project. Future tenants may use various gases to support research. It is not known what gases will be used as part of future research activities. If natural gas is used in future research, it would be combusted in small quantities in tabletop research burners. As such, the proposed project meets the Air District's design element in that it will not include natural gas appliances or natural gas plumbing.
	b) The project will not result in any wasteful, inefficient, or unnecessary electrical usage, as determined by the analysis required under CEQA Section 21100(b)(2) and Section 15126.2(b) of the State CEQA Guidelines.	**Consistent.** The CEQA Proposed Project would achieve, at a minimum, a LEED Silver rating. The project design promotes energy efficiency by optimizing thermal comfort through passive cooling, windbreaks, and prioritizing daylight within floor plates buildings and outdoor spaces. These passive design strategies take advantage of the proposed project's location and relatively mild climate to help naturally regulate building temperatures and ventilation. The project would also utilize all-electric design for new building systems (e.g., HVAC, mechanical). Finally, the proposed project would install photovoltaic systems to generate on-site renewable energy. Compared to the CEQA Proposed Project, the WRF Option would reuse water on site, which in turn reduces the need to transport water over long distances and associated energy consumption (although this benefit is not quantitatively modeled). The CUP Option would also optimize local energy generation and distribution, which in turn improves overall system generation and energy conservation. As such, the proposed project would not waste energy or use energy in an inefficient or unnecessary manner and would be consistent with this Air District design element.
Transportation	a) Achieve compliance with electric-vehicle requirements in the most recently adopted version of CALGreen Tier 2.	**Consistent.** The CEQA Proposed Project would meet the applicable CALGreen Tier 2 nonresidential voluntary requirement (i.e., 45 percent of all spaces to be EV capable and 33 percent of the EV spaces to have electric-vehicle supply equipment). As such, the proposed project would be consistent with this Air District design element.

Sector	Air District Threshold Option A (refer to Table 3.8-3)	Project Consistency
Transportation	b) Achieve a reduction in project-generated vehicle miles traveled (VMT) to a level below the regional average, consistent with the current version of the California Climate Change Scoping Plan, or meet a locally adopted SB 743 VMT target, reflecting the recommendations provided in the Governor's Office of Planning and Research Technical Advisory on Evaluating Transportation Impacts in CEQA: i. Residential projects: 15 percent below the existing VMT per capita, ii. Office projects: 15 percent below the existing VMT per employee, and iii. Retail projects: no net increase in existing VMT	**Inconsistent before Mitigation.** Consistent with the transportation impact analysis, this analysis uses "total VMT per service population" rather than separate per capita and per employee metrics to account for all the VMT generated by the CEQA Proposed project and better capture the interaction and trip internalization between the various project components. The estimated total VMT per service population for the San Francisco Bay Area region under existing (2024) conditions is estimated to be 22.3. Thus, the threshold of significance, which is 15 percent below the existing total VMT per service population for the Bay Area region, is 19.0.[14] The project would develop mixed-use, research, and education uses in a transit priority area with well-connected bicycle and pedestrian infrastructure, thereby reducing the demand for travel by single-occupancy vehicles. The project would include a project-specific TDM plan to reduce the vehicle trips and associated VMT generated by the proposed project through a range of design features. The 22 percent TDM reduction aligns with the TDM requirements in the 2002 PEIS. However, total VMT per service population is estimated to be 20.3, which is above the threshold of significance of 19.0. As such, the proposed project would be inconsistent with this Air District design element prior to mitigation.

EV = electric vehicle; HVAC = heating, ventilation, and air-conditioning; LEED = Leadership in Energy and Environmental Design; TDM = transportation demand management; VMT = vehicle miles traveled

Conclusion

As discussed in Section 3.8.5, *Thresholds of Significance*, the Air District recommends BMPs to minimize construction GHG emissions. Uncontrolled construction GHG emissions would be potentially significant before mitigation. Table 3.8-9 demonstrates that the CEQA Proposed Project (with or without the CUP Option or WRF Option) meets all Air District operational land use design elements for buildings but would be inconsistent with the Air District's VMT criteria for transportation. Accordingly, project operations would be potentially significant before mitigation.

[14] Tan, Valerie. Senior transportation planner, Fehr & Peers. July 19, 2025—email message to ICF regarding Berkeley Space Center Moffett (air quality and noise coordination regarding transportation data).

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

All project contractor(s) shall comply with the Air District's current best management practices (BMPs) for construction-related GHG emissions. The Air District's current BMPs are drawn from their 2023 CEQA Guidelines, Table 6-1, and are identified below, as applicable. Where relevant, air quality mitigation that requires actions equal to or greater than the recommended BMPs are referenced in place of the specific BMP language. The requirement to comply with the control measures included in this mitigation will be identified in construction bids.

- Per Mitigation Measure AQ-1, use zero-emission and hybrid-powered equipment. Require Tier 4 Final compliant engines and renewable diesel for remaining diesel off-road equipment. Prohibit off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.
- Minimize diesel equipment idling time either by shutting equipment off when not in use or reducing the time of idling to no more than 2 minutes (A 5-minute limit is required by the state airborne toxics control measure [Title 13, Sections 2449(d)(3) and 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site and develop an enforceable mechanism to monitor idling time to ensure compliance with this measure.
- Require all construction equipment is maintained and properly tuned in accordance with manufacturer's specifications. Equipment should be checked by a certified mechanic and determined to be running in proper condition prior to operation.
- Require compliance with Mitigation Measure AQ-2 regarding use of zero-emission on-road vehicles during construction, including vehicles used for deliveries and hauling.
- Implement the TDM Plan and comply with the expanded requirements per Mitigation Measure TRAN-1.
- Where grid power is available, provide electrical hook ups for electric construction tools, such as saws, drills and compressors, and using electric tools whenever feasible. Prioritize the use of use alternative fuels, such as propane or solar electrical power where feasible, for generators at construction sites.
- Reduce electricity use in the construction office by using efficient lighting technologies, including, but not limited, to LED technology, powering off computers every day, and utilizing efficient heating and cooling units.
- Minimize energy used during site preparation by deconstructing existing structures to the greatest extent feasible
- Use locally sourced or recycled materials for construction as commercially and financially available and feasible at the time of construction. Wood products used should be certified through a sustainable forestry program.

- Use low-carbon concrete, minimize the amount of concrete used and produce concrete on-site if it is more efficient and lower emitting than transporting ready-mix, as commercially and financially available and feasible at the time of construction.
- Develop a plan to efficiently use water for adequate dust control since substantial amounts of energy can be consumed during the pumping of water.
- Include all requirements in applicable bid documents, purchase orders, and contracts, with successful contractors demonstrating the ability to supply the compliant on- or off-road construction equipment for use prior to any ground-disturbing and construction activities.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2 in Section 3.3, *Air Quality*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure GHG-1 outlines the Air District BMPs that will be implemented to reduce construction GHG emissions. Mitigation Measures AQ-1 and AQ-2 support compliance with the Air District's BMPs for off-road equipment and on-road vehicles. As shown in Table 3.8-4, Mitigation Measure AQ-1 would reduce total construction GHG emissions from the CEQA Proposed Project to 47,709 metric tons CO_2e, or by about 27 percent from the unmitigated scenario. Additional GHG reductions that are not quantifiable would be achieved by Mitigation Measures AQ-2 and GHG-1. With implementation of Mitigation Measures GHG-1, AQ-1, and AQ-2, the CEQA Proposed Project (with or without the CUP Option or WRF Option) would be consistent with the Air District's recommendation to implement BMPs to minimize construction GHG emissions.

Mitigation Measure TRAN-1 would require implementation of additional transportation demand management (TDM) measures. This measure is required to address inconsistencies with State CEQA Guidelines 15064.3, subdivision (b), related to VMT, as described in Section 3.16, *Transportation and Traffic.* With Mitigation Measure TRAN-1, the CEQA Proposed Project would achieve the regional per service population threshold of 19.0 (refer to Impact CEQA-TRAN-2 in Section 3.16 for additional information).[15] The CEQA Proposed Project (with or without the CUP Option or WRF Option) would be consistent with Air District Threshold Option A with implementation of Mitigation Measure TRAN-1.

After implementation of Mitigation Measures GHG-1, AQ-1, AQ-2, and TRAN-1, the CEQA Proposed Project (with or without the CUP Option or WRF Option) will not result in a cumulatively considerable contribution to global climate change. This impact is less than significant with mitigation.

[15] Ibid.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and research and development (R&D) uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project.

Construction

As discussed in Section 3.8.6.1, *Construction*, the same construction activities proposed and evaluated under the CEQA Proposed Project would occur under the No Student/Faculty Housing Variant (Variant). The intensity of construction for the CEQA Proposed Project with or without the Variant would therefore be the same, and the emissions presented in Table 3.8-4 for the CEQA Proposed Project would also occur under the Variant. As shown in Table 3.8-4, construction activities would generate approximately 65,472 metric tons CO_2e over the entire construction period (unmitigated). Uncontrolled construction GHG emissions would be inconsistent with the Air District's recommendation to implement BMPs, as discussed further under *Conclusion.*

Operations

The same operational sources proposed and evaluated under the CEQA Proposed Project would occur under the Variant. Table 3.8-10 presents estimated operational emissions for the Variant under full-build conditions. The table presents emissions with and without implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts, as discussed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impact AIR-2 (Mitigation Measure AQ-5 would not reduce operational GHG emissions). Table 3.8-10 includes emissions from energy, area, waste, and vegetation sources, which would be the same as estimated for the CEQA Proposed Project, to enable a total emissions summation. Table 3.8-10 also presents total emissions under existing (2024) conditions; refer to Table 5-8 for additional detail.

Source: Appendix 3.3-1

Note: As noted in Section 3.8.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the adjustment factors across all operational air quality analyses for the proposed project resulted in a less than 1 percent to 22 percent increase in mobile-source emissions, depending on the analysis year and pollutant (i.e., ROG, NO_X, or PM). It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] Emissions results include implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts.

[c] Sequestration benefits from the proposed planting of 1,283 trees. Emissions results are annualized over a 40-year tree lifetime.

[d] Refer to Table 5-8 for emissions by source.

[e] Net change is the total project (2041) emissions minus total existing (2024) emissions.

CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; HFCs = hydrofluorocarbons; N_2O = nitrous oxide

Compared to the CEQA Proposed Project, the Variant would increase net operational emissions due primarily to greater VMT and trip generation. As discussed in Section 3.8.5, *Thresholds of Significance*, the significance of operations-generated GHG emissions is qualitatively assessed based on consistency with the Air District's land use design elements. Implementation of the Variant would not change the consistency findings of the CEQA Proposed Project with respect to the Air District's land use design elements (see Table 3.8-9). The Variant would utilize all-electric design and implement the same sustainability strategies as described above for the CEQA Proposed Project. The Variant would meet the CALGreen Tier 2 nonresidential EV voluntary requirement but total VMT per service population is estimated to be 20.3, which would exceed the Air Districts' threshold of significance of 19.0 (see Impact CEQA-TRAN-1 in Section 3.16, *Transportation and Traffic*).

Conclusion

Overall, there would be no difference in the impact conclusion between the CEQA Proposed Project and the CEQA Proposed Project with the Variant. Uncontrolled construction GHG emissions would be potentially significant before mitigation. The Variant would meet all Air District operational land use design elements for buildings but would be inconsistent with the Air District's VMT criteria for transportation. Accordingly, project operations would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact GHG-1.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2 in Section 3.3, *Air Quality*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure GHG-1 outlines the Air Districts BMPs that will be implemented to reduce construction GHG emissions. Mitigation Measures AQ-1 and AQ-2 support compliance with the Air District's BMPs for off-road equipment and on-road vehicles. As shown in Table 3.8-2, Mitigation Measure AQ-1 would reduce total construction GHG emissions from the CEQA Proposed Project with the Variant to 47,709 metric tons CO_2e, or by about 27 percent from the unmitigated scenario. Additional GHG reductions that are not quantifiable would be achieved by Mitigation Measures AQ-2 and GHG-1. With implementation of Mitigation Measures GHG-1, AQ-1, and AQ-2, the CEQA Proposed Project with the Variant would be consistent with Air District's recommendation to implement BMPs to minimize construction GHG emissions.

Mitigation Measure TRAN-1 would require implementation of additional TDM measures. With Mitigation Measure TRAN-1, the CEQA Proposed Project with the Variant would achieve the regional per service population threshold of 19.0 (refer to Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, for additional information).[16] The Variant would therefore be consistent with Air District Threshold Option A with implementation of Mitigation Measure TRAN-1.

After implementation of Mitigation Measures GHG-1, AQ-1, AQ-2, and TRAN-1, the CEQA Proposed Project with the Variant would not result in a cumulatively considerable contribution to global climate change. This impact is less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Construction

The same construction activities proposed and evaluated under the CEQA Proposed Project would occur under the CEQA Reduced Density Alternative. The intensity of construction for the CEQA Proposed Project and the CEQA Reduced Density Alternative would be the same except for a slight reduction in the duration of the "core and shell" and "architectural coating" sub-phases for research buildings under the CEQA Reduced Density Alternative. Table 3.8-11 presents estimated construction emissions for the CEQA Reduced Density Alternative. Specifically, Table 3.8-11 presents emissions with and without implementation of Mitigation Measure AQ-1, which is required to address air quality impacts, as discussed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impact AIR-2.

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.8.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming construction would begin in 2026. It is projected that the emissions intensity of equipment and vehicle operation in 2027 would be lower than under 2026 conditions. Accordingly, the construction analysis reflects a conservative representation of emissions. CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the ROG, NO_X, and PM adjustment factors across all construction air quality analyses for the proposed project resulted in a less than 1 percent increase in affected emissions, due largely to the fact that construction emissions are generated primarily by off-road equipment. It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] Emissions results include implementation of Mitigation Measure AQ-1 (Mitigation Measure AQ-2 is not quantified), which is required to address air quality impacts.

CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; HFCs = hydrofluorocarbons; N_2O = nitrous oxide

Table 3.8-11 indicates that construction of the CEQA Reduced Density Alternative would generate approximately 62,740 metric tons CO_2e over the entire construction period (unmitigated). Compared to the CEQA Proposed Project, construction emissions would be slightly less under the CEQA Reduced Density Alternative due to slightly shorter durations for some sub-phases. Uncontrolled construction GHG emissions would be inconsistent with the Air District's recommendation to implement BMPs, as discussed further under *Conclusion*.

Operations

The same operational sources proposed and evaluated under the CEQA Proposed Project would occur under the CEQA Reduced Density Alternative. Table 3.8-12 presents estimated operational emissions for the CEQA Reduced Density Alternative under full-build conditions. Specifically, Table 3.8-12 presents emissions with and without implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts, as discussed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impact AIR-2 (Mitigation Measure AQ-5 would not reduce operational

GHG emissions). Table 3.8-12 also presents total emissions under existing (2024) conditions; refer to Table 5-8 for additional detail.

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.8.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the adjustment factors across all operational air quality analyses for the proposed project resulted in a less than 1 percent to 22 percent increase in mobile-source emissions, depending on the analysis year and pollutant (i.e., ROG, NO_X, or PM). It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] Emissions results include implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts.

[c] Sequestration benefits from the proposed planting of 1,283 trees. Emissions results are annualized over a 40-year tree lifetime.

[d] Refer to Table 5-8 for emissions by source.

[e] Net change is the total project (2041) emissions minus total existing (2024) emissions.

CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; HFCs = hydrofluorocarbons; N_2O = nitrous oxide

Compared to the CEQA Proposed Project, the CEQA Reduced Density Alternative would reduce net operational emissions due primarily to reduced VMT and trip and waste generation. As discussed in Section 3.8.5, *Thresholds of Significance*, the significance of operations-generated GHG emissions is qualitatively assessed based on consistency with the Air District's land use design elements. Implementation of the CEQA Reduced Density Alternative would not change the consistency findings of the CEQA Proposed Project with respect to the Air District's land use design elements (see Table 3.8-9). The CEQA Reduced Density Alternative would utilize all-electric design and implement the same sustainability strategies as described for the CEQA Proposed Project. The CEQA Reduced Density Alternative would meet the CALGreen Tier 2 nonresidential EV voluntary requirement but total VMT per service population would exceed the Air Districts' threshold of significance of 19.0 (see Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*).

Conclusion

Overall, there would be no difference in the impact conclusion before mitigation between the CEQA Proposed Project and the CEQA Reduced Density Alternative. Uncontrolled construction GHG emissions would be potentially significant before mitigation. The CEQA Reduced Density Alternative would meet all Air District operational land use design elements for buildings but would be inconsistent with the Air District's VMT criteria for transportation. Accordingly, project operations would be potentially significant under before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2 in Section 3.3, *Air Quality*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure GHG-1 outlines the Air Districts BMPs that will be implemented to reduce construction GHG emissions. Mitigation Measures AQ-1 and AQ-2 support compliance with the Air District's BMPs for off-road equipment and on-road vehicles. As shown in Table 3.8-11, Mitigation Measure AQ-1 would reduce total construction GHG emissions from the CEQA Reduced Density Alternative to 45,998 metric tons CO_2e, or by about 27 percent from the unmitigated scenario. Additional GHG reductions that are not quantifiable would be achieved by Mitigation Measures AQ-2 and GHG-1. With implementation of Mitigation Measures GHG-1, AQ-1, and AQ-2, the CEQA Reduced Density Alternative would be consistent with Air District's recommendation to implement BMPs to minimize construction GHG emissions.

Mitigation Measure TRAN-1 would require implementation of additional TDM measures. To achieve the regional per service population VMT threshold of 19.0, VMT per service population would need to be reduced by an additional 17 percentage points beyond the 22 percent achieved by the TDM Plan (39 percent total). Mitigation Measure TRAN-1 would achieve a maximum of a 31 percent reduction and not meet the mitigation requirements of 39 percent under the CEQA Reduced Density Alternative (refer to Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, for additional information).[17] Additional VMT reductions would not be considered feasible for the CEQA Reduced Density Alternative, as achieving such a reduction would require fundamental changes to the project

[17] Ibid.

description to mitigate the impact. As such, the CEQA Reduced Density Alternative would not be consistent with Air District Threshold Option A, and after implementation of Mitigation Measures GHG-1, AQ-1, AQ-2, and TRAN-1, the CEQA Reduced Density Alternative will result in a cumulatively considerable contribution to global climate change from mobile sources. This impact is significant and unavoidable.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative.

Construction

As discussed in Section 3.8.6.1, *Construction*, the same construction activities proposed and evaluated under the CEQA Reduced Density Alternative would occur under the Variant. The intensity of construction for the CEQA Reduced Density Alternative with or without the Variant would therefore be the same, and the emissions presented in Table 3.8-11 for the CEQA Reduced Density Alternative would also occur under the Variant. As shown in Table 3.8-11, construction activities would generate approximately 62,740 metric tons of CO_2e over the entire construction period (unmitigated). Uncontrolled construction GHG emissions would be inconsistent with the Air District's recommendation to implement BMPs, as discussed further under *Conclusion*.

Operations

The same operational sources proposed and evaluated under the CEQA Reduced Density Alternative would occur under the Variant. Table 3.8-13 presents estimated operational emissions for the CEQA Reduced Density Alternative with the Variant under full-build conditions. Specifically, Table 3.8-13 presents emissions with and without implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts, as discussed in Section 3.3.7, *Impacts and Mitigation Measures*, under Impact AIR-2 (Mitigation Measure AQ-5 would not reduce operational GHG emissions). Emissions from energy, area, waste, and vegetation sources would be the same as estimated for the CEQA Reduced Density Alternative; such emissions are included in the table to enable a total emissions summation. Table 3.8-13 also presents total emissions under existing (2024) conditions; refer to Table 5-8 for additional detail.

Net Change [e]	12,308	17	< 1	179	13,039	11,374	16	< 1	178	12,093

Source: Air Quality, Health Risk, and GHG Technical Report in Appendix 3.3-1 of this joint EIR/EIS.

Note: As noted in Section 3.8.6, *Methods for Analysis*, based on information available at the time the Air Quality, Health Risk, and GHG Technical Report was prepared, emissions were quantified by assuming operation would begin in 2040. It is projected that the emissions intensity of equipment and vehicle operation in 2041 would be lower than under 2040 conditions. Accordingly, the analysis reflects a conservative representation of emissions. CARB has not published GHG adjustment factors for EMFAC2021 to account for congressional disapproval of the ACT, Warranty Phase 1, and Omnibus regulations. Application of the adjustment factors across all operational air quality analyses for the proposed project resulted in a less than 1 percent to 22 percent increase in mobile-source emissions, depending on the analysis year and pollutant (i.e., ROG, NO_X, or PM). It is reasonable to conclude removal of the regulations may affect estimated GHG emissions by the same magnitude.

[a] Values are rounded to the nearest whole number.

[b] Emissions results include implementation of Mitigation Measures AQ-6 and TRAN-1, which are required to address air quality impacts.

[c] Sequestration benefits from the proposed planting of 1,283 trees. Emissions results are annualized over a 40-year tree lifetime.

[d] Refer to Table 5-8 for emissions by source.

[e] Net change is the total project (2041) emissions minus total existing (2024) emissions.

CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; HFCs = hydrofluorocarbons; N_2O = nitrous oxide

Compared to the CEQA Reduced Density Alternative, the Variant would increase net operational emissions due primarily to greater VMT and trip generation. Implementation of the Variant would not change the consistency findings of the CEQA Proposed Project and the CEQA Reduced Density Alternative with respect to the Air District's land use design elements (see Table 3.8-9). The Variant would utilize all-electric design and implement the same sustainability strategies as described for CEQA Proposed Project and the CEQA Reduced Density Alternative. The Variant would meet the CALGreen Tier 2 nonresidential EV voluntary requirement but total VMT per service population would exceed the Air Districts' threshold of significance of 19.0 (see Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*).

Conclusion

Overall, there would be no difference in the impact conclusion before mitigation between the CEQA Proposed Project and CEQA Reduced Density Alternative with Variant. Uncontrolled construction

GHG emissions would be potentially significant before mitigation. The Variant would meet all Air District operational land use design elements for buildings but would be inconsistent with the Air District's VMT criteria for transportation. Accordingly, project operations would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure GHG-1. Best Management Practices for Construction-Related GHG Emissions

See discussion for the CEQA Proposed Project under Impact CEQA-GHG-1.

Mitigation Measure AQ-1. Electric Equipment and Emissions Controls for Off-Road Diesel Engines during Construction

Mitigation Measure AQ-2. Zero-Emission On-Road Vehicles during Construction

See discussion for the CEQA Proposed Project under Impact CEQA-AIR-2 in Section 3.3, *Air Quality*, of this joint EIR/EIS.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure GHG-1 outlines the Air Districts BMPs that will be implemented to reduce construction GHG emissions. Mitigation Measures AQ-1 and AQ-2 support compliance with the Air District's BMPs for off-road equipment and on-road vehicles. As shown in Table 3.8-11, Mitigation Measure AQ-1 would reduce total construction GHG emissions from the CEQA Reduced Density Alternative with the Variant to 45,998 metric tons CO_2e, or by about 27 percent from the unmitigated scenario. Additional GHG reductions that are not quantifiable would be achieved by Mitigation Measures AQ-2 and GHG-1. With implementation of Mitigation Measures GHG-1, AQ-1, and AQ-2, the CEQA Reduced Density Alternative with the Variant would be consistent with Air District's recommendation to implement BMPs to minimize construction GHG emissions.

Mitigation Measure TRAN-1 would require implementation of a mitigated TDM plan that further reduces VMT. To achieve the regional per service population VMT threshold of 19.0, VMT per service population would need to be reduced by an additional 19 percentage points beyond the 22 percent achieved by the TDM Plan (41 percent total). Mitigation Measure TRAN-1 would achieve a maximum of a 31 percent reduction and not meet the mitigation requirements of 41 percent under the Variant (refer to Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, for additional information).[18] Additional VMT reductions would not be considered feasible for the Variant, as achieving such a reduction would require fundamental changes to the project description to mitigate the impact. As such, the Variant would not be consistent with Air District Threshold Option A, and after implementation of Mitigation Measures GHG-1, AQ-1, AQ-2, and TRAN-1, the Variant will result

[18] Ibid.

in a cumulatively considerable contribution to global climate change from mobile sources. This impact is significant and unavoidable.

Impact CEQA-GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	TRAN-1. Require a Mitigated TDM Plan that Further Reduces VMT	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Significant and Unavoidable with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

2022 Scoping Plan (Senate Bill 32 and Assembly Bill 1279)

SB 32 outlines the State's GHG emissions reduction targets for 2030. AB 1279 sets a more ambitious State goal of net-zero GHG emissions by 2045 and an 80 percent reduction in anthropogenic emissions from 1990 levels by 2045.

CARB's *2022 Scoping Plan* assesses progress toward the statutory 2030 target while laying out a path to achieving carbon neutrality no later than 2045. It outlines the main strategies for achieving the SB 32 GHG reduction target (i.e., reduce GHG emissions to at least 40 percent below 1990 levels by 2030), achieving carbon neutrality by 2045, and reducing anthropogenic emissions to 85 percent below 1990 levels.[19] Appendix D to CARB's *2022 Scoping Plan*, Local Actions, identifies key project attributes that empirical evidence has shown to reduce operational GHG emissions while simultaneously advancing fair housing. CARB concludes that "[r]esidential and mixed-use projects that have all of the key project attributes in Table 3 [Key Residential and Mixed-Use Project Attributes that Reduce GHGs] should accommodate growth in a manner consistent with State GHG reduction and equity prioritization goals."[20] Table 3.8-14 evaluates consistency of the CEQA Proposed Project (with or without the CUP Option or WRF Option) with the scoping plan–identified key project attributes.

[19] California Air Resources Board. 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. November.

[20] Ibid.

Table 3.8-14. CEQA Proposed Project Consistency with CARB 2022 Scoping Plan Key Project Attributes

Sector	Scoping Plan Project Attribute	Project Consistency
Transportation Electrification	Provides EV charging infrastructure that, at a minimum, meets the most ambitious voluntary standard in the California Green Building Standards Code at the time of project approval.	**Consistent.** See Table 3.8-9. The CEQA Proposed Project meets the CALGreen Tier 2 nonresidential voluntary requirement and would be consistent with this attribute.
VMT Reduction	Is located on infill sites that are surrounded by existing urban uses and reuses or redevelops previously undeveloped or underutilized land that is presently served by existing utilities and essential public services (e.g., transit, streets, water, sewer).	**Consistent**. The CEQA Proposed Project includes mixed-use infill development in an existing urbanized area, thereby supporting local, regional, and state mobility and GHG reduction objectives to reduce VMT and infrastructure costs. As discussed in Section 3.16, *Transportation and Traffic*, most of the Project Site is within 0.5 mile of a light rail station. The project would not provide excessive parking or demolish affordable residential units. It would include a TDM plan and be consistent with Plan Bay Area. Accordingly, the proposed project meets OPR's Near Transit Stations criterion and has characteristics that indicate it may not generate significant levels of VMT. The project would be consistent with this and other VMT reduction attributes, as explained further in this table.
	Does not result in the loss or conversion of natural and working lands.	**Consistent**. The Project Site is in an existing urbanized area and currently occupied by buildings and parking lots. As such, the proposed project would not result in the loss or conversion of natural or working lands. The CEQA Proposed Project would remove approximately 227 existing trees during construction and plant approximately 1,283 new trees, resulting in a net addition of approximately 1,056 trees. As such, the proposed project would be consistent with this attribute.
	Consists of transit-supportive densities (minimum of 20 residential dwelling units per acre) or is in proximity to existing transit stops (within a half mile) or satisfies more detailed and stringent criteria specified in the region's SCS.	**Consistent**. As noted above, most of the Project Site is within 0.5 mile of the Bayshore/NASA VTA light rail station and therefore within walking and biking distance. As such, the CEQA Proposed Project would be consistent with this attribute because it is proximate to existing transit stops (within a half mile).
	Reduces parking requirements by eliminating parking requirements or including maximum allowable parking ratios (i.e., the ratio of parking spaces to residential units or square feet) or providing a residential parking supply at a ratio of	**Consistent**. Minimum parking requirements in the local zoning ordinance are not applicable to the CEQA Proposed Project. As noted above, The project would not provide excessive parking. Specifically, the proposed project would provide automobile parking at the maximum ratios established in the Berkeley Space Center Development Guidelines. The Development Guidelines establish a maximum of 1.5 spaces per 1,000 square feet for office and research uses. By comparison,

Sector	Scoping Plan Project Attribute	Project Consistency
	less than one parking space per dwelling unit or, for multi-family residential development, requiring parking costs to be unbundled from costs to rent or own a residential unit.	the ITE *Parking Generation* includes an average peak parking demand of 1.95 parking spaces per 1,000 square feet for office uses. The project maximum parking ratio is also lower than the typical parking demand for single-use sites in suburban settings where minimal non-automobile infrastructure is available. The project is a nonresidential project. The proposed Student/Faculty Housing would be used by UC students or faculty on a short-term basis (i.e., academic calendar year, semester, or summer). For these units, the Development Guidelines establish a maximum of 1.0 parking spaces per unit. In comparison, the ITE *Parking Generation* includes an average peak parking demand of 1.23 to 1.27 parking spaces per unit for suburban multifamily developments.
	At least 20 percent of units included are affordable to lower-income residents.	**N/A**. The CEQA Proposed Project is a nonresidential project. The proposed Student/Faculty Housing would be used by UC students or faculty on a short-term basis (i.e., academic calendar year, semester, or summer). Housing would prioritize the UC students and faculty affiliated with the CEQA Proposed Project or the CEQA Reduced Density Alternative as well as on-site federal employees and student interns, per the Project Proponent's Enhanced Use Lease requirements. A minimum of 10 percent of the Student/Faculty Housing units would be affordable (i.e., affordable to households with 80 percent of Area Median Income, as adjusted for household size). These priorities serve to reduce VMT, consistent with Scoping Plan goals. The units would not be available on the public housing market. This attribute does not apply to the proposed project.
	Results in no net loss of existing affordable units.	**Consistent**. The Project Site is currently occupied by office, military, recreation, and industrial buildings and parking lots. The CEQA Proposed Project would therefore not result in a net loss in existing affordable units and would be consistent with this attribute.
Building Decarbonization	Uses all-electric appliances without natural gas connections and does not use propane or other fossil fuels for space heating, water heating, or indoor cooking.	**Consistent.** See Table 3.8-9. The CEQA Proposed Project would build all-electric buildings; natural gas would not be used for space heating, water heating, or indoor cooking. As such, the proposed project would be consistent with this attribute.

EV = electric vehicle; HVAC = heating, ventilation, and air-conditioning; ITE = Institute of Transportation Engineers; LEED = Leadership in Energy and Environmental Design; TDM = transportation demand management; VMT = vehicle miles traveled; VTA = Santa Clara Valley Transportation Authority

Table 3.8-14 demonstrates that the CEQA Proposed Project would incorporate all applicable scoping plan–identified key project attributes. Compared to the CEQA Proposed Project, the WRF Option would further support the *2022 Scoping Plan* by reusing water on-site, which in turn reduces the need to transport water over long distances and associated energy consumption (although this

benefit is not quantitatively modeled). The CUP Option would also optimize local energy generation and distribution, which in turn improves overall system generation and energy conservation.

The CEQA Proposed Project's (with or without the CUP Option or WRF Option) consistency with the scoping plan–identified key project attributes provides evidence that the proposed project would not conflict with implementation of CARB's *2022 Scoping Plan* or attainment of the statewide GHG targets for 2030 and 2045 mandated by SB 32 and AB 1279, respectively. As such, the CEQA Proposed Project (with or without the CUP Option or WRF Option) aligns with the GHG emissions reduction strategies outlined in CARB's *2022 Scoping Plan*.

Plan Bay Area

Plan Bay Area is consistent with SB 375, which requires the Metropolitan Transportation Commission (MTC) and the Association of Bay Area Governments to adopt a sustainable communities strategy that outlines policies to reduce per capita GHG emissions from automobiles and light trucks. Environment and transportation are two of four elements discussed in MTC's *Plan Bay Area*. Both elements comprise a set of strategies that aim to reduce both VMT and emissions. The strategies include a mix of measures that encourage compact growth patterns, alternative transportation, transit, mobility and access, network expansion, and transportation investment.

The CEQA Proposed Project (with or without the CUP Option or WRF Option) would improve conditions for walking and biking by providing on-street bicycle racks and long-term bicycle storage for students and workers, as well as orienting buildings to be sidewalk facing and have multiple pedestrian entrances. The project is an infill development that would involve redevelopment and densification of the site. The Project Site is identified by MTC as a Transit Priority Area because of its proximity to the Bayshore/NASA Santa Clara Valley Transportation Authority light rail station.[21] Investing in transit priority sites will help achieve the climate and equity goals of *Plan Bay Area 2050*.[22] Overall, the CEQA Proposed Project would incorporate TDM features, which would reduce trip generation by at least 22 percent.[23] However, total VMT per service population is estimated to be 20.3, which is above the per service population VMT target for the San Francisco Bay Area (Bay Area). As such, the CEQA Proposed Project (with or without the CUP Option or WRF Option) would not fully align with *Plan Bay Area* before mitigation.

2017 Clean Air Plan

The Air District's 2017 Clean Air Plan contains the following primary GHG goal:

- **Protect the Climate**. Reduce Bay Area GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050.

Attaining this goal will require aggressive and rapid decarbonization across the San Francisco Bay Area. The CEQA Proposed Project (with or without the CUP Option or WRF Option) is

[21] Metropolitan Transportation Commission. 2024. *Transit Priority Areas (2021).* Available: https://opendata.mtc.ca.gov/datasets/MTC::transit-priority-areas-2021-1/ explore?location=37.408035%2C-122.048308%2C15.97. Accessed: May 22, 2024.

[22] Metropolitan Transportation Commission and Association of Bay Area Governments. 2024. *What Is Transit Priority?* Last revised: March 26, 2024. Available: https://blog.bayareametro.gov/posts/ what-transit-priority. Accessed: May 22, 2024.

[23] Tan, Valerie. Senior transportation planner, Fehr & Peers. July 19, 2025—email message to ICF regarding Berkeley Space Center Moffett (air quality and noise coordination regarding transportation data).

designed around the concept of sustainability and will directly support long-term regional emission reductions by developing energy-efficiency and resilient buildings and infrastructure. As discussed above, all buildings will achieve a minimum LEED Silver rating, incorporate passive climate design features, and exclude any natural gas connections for buildings operations. The project also would install photovoltaic systems as a strategy for generating power on-site and offsetting the energy use from each proposed building. The project is strategically located near transit and includes numerous TDM elements that will support active and alternative transportation. Beyond energy and transportation, the CEQA Proposed Project incorporates features to conserve water, reduce waste, and increase urban tree planting. Collectively, the project design features align with larger regional and State strategies to reduce GHG emissions. However, the CEQA Proposed Project (with or without the CUP Option or WRF Option) is not fully consistent with BAAQMD Threshold Option A (see Table 3.8-3) and therefore would not fully align with the 2017 Clean Air Plan and regional attainment of long-term climate goals before mitigation.

Conclusion

The CEQA Proposed Project (with or without the CUP Option or WRF Option) would be consistent with CARB's *2022 Scoping Plan*–identified key project attributes applicable to the proposed project. However, while the proposed project's sustainable design features support emission reduction, VMT estimated for the CEQA Proposed Project (with or without the CUP Option or WRF Option) exceeds the per service population VMT target for the Bay Area. Accordingly, the proposed project would conflict with *Plan Bay Area*, the applicable regional plan for reducing mobile-source emissions in the San Francisco Bay Area, and the overall emission reduction goals of the *2017 Clean Air Plan*. This impact would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure TRAN-1 would require implementation of a mitigated TDM plan that further reduces VMT. With Mitigation Measure TRAN-1, the CEQA Proposed Project would achieve the per service population VMT target for the Bay Area, achieving consistency with *Plan Bay Area* and *2017 Clean Air Plan* (refer to Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, for additional information).[24] Therefore, the CEQA Proposed Project (with or without the CUP Option or WRF Option) would not conflict with State, regional, or local plans designed to achieve the GHG reduction goals mandated by SB 32 and AB 1279 for 2030 and 2045, respectively. This impact is less than significant with mitigation.

[24] Ibid.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project.

Overall, there would be no difference in the impact mechanism or conclusion between the CEQA Proposed Project and the CEQA Proposed Project with Variant. The same sustainability strategies described above for the CEQA Proposed Project would be implemented under the Variant. The Variant would be consistent with CARB's 2022 Scoping Plan–identified key project attributes applicable to the proposed project but exceed the per service population VMT target for the Bay Area, conflicting with *Plan Bay Area* and *2017 Clean Air Plan*. This impact would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure TRAN-1 requires implementation of a mitigated TDM plan that further reduces VMT. With Mitigation Measure TRAN-1, the CEQA Proposed Project with the Variant would achieve the per service population VMT target for the Bay Area, achieving consistency with *Plan Bay Area* and *2017 Clean Air Plan* (refer to Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, for additional information).[25] Therefore, the Variant would not conflict with State, regional, or local plans designed to achieve the GHG reduction goals mandated by SB 32 and AB 1279 for 2030 and 2045, respectively. This impact is less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

Overall, there would be no difference in the impact conclusion before mitigation between the CEQA Proposed Project and the CEQA Reduced Density Alternative. The same sustainability strategies described above for the CEQA Proposed Project would be implemented under the CEQA Reduced Density Alternative. The CEQA Reduced Density Alternative would be consistent with CARB's *2022 Scoping Plan*–identified key project attributes applicable to the proposed project but exceed the per service population VMT target for the Bay Area, conflicting with *Plan Bay Area* and *2017 Clean Air Plan*. This impact would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

[25] Ibid.

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure TRAN-1 requires implementation of a mitigated TDM plan that further reduces VMT. With Mitigation Measure TRAN-1, the CEQA Reduced Density Alternative would not achieve the per service population VMT target for the Bay Area, and would not be consistent with *Plan Bay Area* or *2017 Clean Air Plan* (refer to Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, for additional information).[26] Therefore, the CEQA Reduced Density Alternative would conflict with State, regional, or local plans designed to achieve the GHG reduction goals mandated by SB 32 and AB 1279 for 2030 and 2045, respectively. This impact is significant and unavoidable.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative.

Overall, there would be no difference in the impact mechanism or conclusion before mitigation between the CEQA Proposed Project and the CEQA Reduced Density Alternative compared to the CEQA Reduced Density Alternative with the Variant. The same sustainability strategies described above for the CEQA Proposed Project and the CEQA Reduced Density Alternative would be implemented under the Variant. The Variant would be consistent with CARB's 2022 Scoping Plan–identified key project attributes applicable to the proposed project but exceed the per service population VMT target for the Bay Area, conflicting with *Plan Bay Area* and *2017 Clean Air Plan*. This impact would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure TRAN-1. Mitigated TDM Plan that Further Reduces VMT

See discussion for the CEQA Proposed Project under Impact CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS.

Significance After Mitigation

Mitigation Measure TRAN-1 would require implementation of a mitigated TDM plan that further reduces VMT. With Mitigation Measure TRAN-1, the CEQA Reduced Density Alternative with the Variant would not achieve the per service population VMT target for the Bay Area, and would not be consistent with *Plan Bay Area* or *2017 Clean Air Plan* (refer to Impact CEQA-TRAN-2 in Section 3.16,

[26] Ibid.

Transportation and Traffic, for additional information).[27] Therefore, the Variant would conflict with State, regional, or local plans designed to achieve the GHG reduction goals mandated by SB 32 and AB 1279 for 2030 and 2045, respectively. This impact is significant and unavoidable.

3.8.8 Cumulative Impacts

The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Impact Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. Climate change is a global problem, and GHG impacts are inherently cumulative. This is because GHGs contribute to global climate change, regardless of where they are emitted. Climate change is the result of the individual contributions of countless past, present, and future sources. Thus, the analysis and conclusions presented in Section 3.8.7, *Impacts and Mitigation Measures*, characterize the cumulative impacts of the proposed project.

Impact CEQA-C-GHG-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to greenhouse gas emissions or conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases? (Less than Cumulatively Considerable with Mitigation for CEQA Proposed Project; Cumulatively Considerable Contribution with Mitigation for CEQA Reduced Density Alternative)

Construction and operation of the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would generate GHG emissions that could have short and long-term impacts on global GHG concentrations. Uncontrolled construction GHG emissions would be inconsistent with the Air District's recommendation to implement BMPs to reduce construction generated emissions. The project meets all Air District operational land use design elements for buildings but would be inconsistent with the Air District's VMT criteria for transportation, conflicting with *Plan Bay Area* and *2017 Clean Air Plan*. Thus, cumulative construction emissions and mobile-source emissions from implementation of the proposed project would be potentially significant before mitigation.

Mitigation Measure GHG-1 outlines the Air Districts BMPs that will be implemented to reduce construction GHG emissions. Mitigation Measures AQ-1 and AQ-2 support compliance with the Air District's BMPs for off-road equipment and on-road vehicles. With implementation of Mitigation Measures GHG-1, AQ-1, and AQ-2, the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would be consistent with Air District's recommendation to implement BMPs to minimize construction GHG emissions.

Mitigation Measure TRAN-1 would require implementation of a mitigated TDM plan that further reduces VMT. With Mitigation Measure TRAN-1, the CEQA Proposed Project with or without the Variant or WRF or CUP Options would achieve the regional per service population VMT threshold, achieving consistency with the District Threshold Option A, *Plan Bay Area*, and *2017 Clean Air Plan* (refer to Impacts CEQA-GHG-1 and CEQA-GHG-2 in Section 3.8.7, *Impacts and Mitigation Measures*, as well as CEQA-TRAN-2 in Section 3.16, *Transportation and Traffic*, for additional information).[28] After implementation of Mitigation Measures GHG-1, AQ-1, AQ-2, and TRAN-1, the CEQA Proposed Project with or without the Variant or WRF or CUP Options would not result in a cumulatively

[27] Ibid.

[28] Ibid.

considerable contribution to global climate change, or conflict with State, regional, or local GHG reduction plans. With respect to the CEQA Reduced Density Alternative, Mitigation Measure TRAN-1 would not achieve the required VMT reductions to achieve the regional VMT threshold or District Threshold Option A. Accordingly, the CEQA Reduced Density Alternative with or without the Variant would result in a cumulatively considerable contribution to global climate change, or conflict with State, regional, or local GHG reduction plans.

3.9 Hazards and Hazardous Materials

3.9.1 Introduction

This section evaluates the potential impacts related to hazards and hazardous materials that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Project Site as well as the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical studies prepared for the project:

- *Environmental Issues Management Plan Berkeley Space Center Premises Parcels 1A, 3, 5A, 5B, and 6A Former NAS Moffett Field, California* (Spring 2026 project-specific EIMP) prepared by EKI, Spring 2026[1] (Appendix 2-2 of this joint environmental impact report/environmental impact statement [EIR/EIS]).
- *Berkeley Space Center at NASA Research Park—Hazardous Material Conditions* (Hazardous Material Conditions Memorandum) prepared by EKI, January 2026 (Appendix 3.9-1 of this joint EIR/EIS).

In addition, this analysis uses the following technical studies and reports:

- *CY2023 Annual Progress Report NASA Ames Regional Groundwater Remediation Program NASA Area of Responsibility and Site 28 WATS Area* (Groundwater Monitoring and Remediation Report) prepared by BB&E Consulting Engineers and Professionals, April 2024.
- *2024 Annual Progress Report Middlefield-Ellis-Whisman Fairchild (MEW) and Regional Groundwater Remediation Programs Mountain View, California* (Groundwater Monitoring and Remediation Report) prepared by Geosyntec Consultants, April 2025.
- *2024 Annual Vapor Intrusion Progress Report Former Fairchild and Regional Groundwater Remediation Program Properties Middlefield-Ellis-Whisman Vapor Intrusion Study Area Mountain View, California* (Vapor Intrusion Progress Report) prepared by Geosyntec Consultants, April 2025.

In addition to a review of the technical documents listed above, ICF conducted a supplemental online review to search for site listings within the Limits of Work that may have been newly added between preparation/ publishing of the reports listed above and preparation of this section. Details are provided in Section 3.9.2, *Affected Environment/Environmental Setting*.

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. The NOP/NOI comments pertaining to hazards and hazardous materials include a recommendation by the U.S. Environmental Protection Agency (EPA) to incorporate analyses consistent with National Environmental Policy Act (NEPA) requirements, along with a discussion of project implementation in relation to ongoing cleanup activities, contamination to be encountered during the construction phase, and project

[1] The Spring 2026 project-specific EIMP is currently under review by the EPA and San Francisco Bay Regional Water Quality Control Board, the regulatory agencies that will approve of the EIMP. NASA has previously reviewed and provided comments on the Spring 2026 project-specific EIMP.

cleanup activities to occur during project implementation. These issues are addressed under Impact CEQA-HAZ-2.

The NOP/NOI comments pertaining to hazards and hazardous materials include a recommendation by the Department of Toxic Substances Control (DTSC) to incorporate a discussion regarding oversight and coordination with the San Francisco Bay Regional Water Quality Control Board Regional Water Board (Regional Water Board) and to also include the need for hazardous building materials surveys and the testing of imported fill. These issues are addressed under Impact CEQA-HAZ-2. Lastly, the Carpenters Union Local 405 includes a recommendation to evaluate direct impacts on construction workers (as well as the indirect costs) associated with the exposure to hazards and hazardous materials. The section does not include a cost analysis; however, the potential impacts to construction workers are discussed under Impact CEQA-HAZ-2.

3.9.2 Affected Environment/Environmental Setting

3.9.2.1 Project Site

The Project Site is located within the NRP portion of the Naval Air Station Moffett Field Superfund Site (NAS) Superfund Site and soil and groundwater within the Project Site have been impacted by historical use by the Navy, as well as by the migration of groundwater containing chlorinated volatile organic compounds (VOCs) originating south of the Project Site from the portion of the MEW Superfund Site located in the City of Mountain View.[2] The Project Proponent would not be responsible for remediation of NAS Superfund Site or MEW Superfund Site groundwater.

Numerous potential sources of contamination within the Project Site have been investigated and remediated. These contaminant sources are primarily associated with historical use of underground storage tanks (USTs) and sumps that contained petroleum hydrocarbon products and/or chlorinated VOCs. Additional details related to on-site contamination can be found in Section 3.9.2.2, *Historical Hazardous Materials Impacts and Prior Environmental Investigations*.

In addition, a large regional plume of chlorinated VOCs is present on-site and is associated with portions of the MEW Superfund Site located south of U.S. 101. The plume has commingled with groundwater contamination from Navy chlorinated solvent sources located within the NRP and NASA sources within National Aeronautics and Space Administration Ames Research Center (NASA ARC). In addition, petroleum hydrocarbons and fuel-related constituents, such as benzene, toluene, ethylbenzene and xylenes (BTEX), have affected on-site groundwater from sources at Moffett Field. To address groundwater impacts in the vicinity of the Project Site, two groundwater extraction and treatment facilities are currently operating near the Project Site, the NASA West-Side Aquifers Treatment System (WATS) and the MEW Groundwater Treatment System. The West Side Aquifers, which underlies the Project Site, was identified as one of the original Operable Units for NAS Moffett Field. In October 1992, EPA determined that the aquifers within this area were affected by regional groundwater contamination migrating from a group of companies located within an area south of Moffett Field and bounded by East Middlefield Road, Ellis Street, Whisman Road, and U.S. Highway 101; this area is commonly referred to as the MEW Superfund Site. In 1997, the Navy began

[2] The portion of the MEW Vapor Intrusion Area that is located in the vicinity of the Project Site is shown on Figures 3.9-2 and 3.9-4. The MEW Vapor Intrusion Study Area represents the boundary of the MEW Superfund Site VOC groundwater plume where trichloroethene concentrations are greater than 5 micrograms per liter. The project would not be responsible for MEW Superfund Site groundwater remediation.

construction of the WATS to extract and treat groundwater impacted by VOCs and petroleum hydrocarbons. The WATS is now owned and operated by NASA and associated with the NAS Superfund Site area. The WATS is approximately 1,000 feet north of the Project Site. None of the piping associated with the WATS nor the WATS itself are located within the Project Site. Some of the monitoring wells are located within the Project Site. Treated groundwater from the WATS is discharged into NASA's stormwater retention pond at the northernmost portion of NASA ARC. The Navy began operating the WATS in 1998, which currently treats groundwater pumped from six A1-aquifer zone extraction wells, three A2-aquifer zone wells, and the storm drain sumps. The MEW extraction and treatment system is directly adjacent to the Project Site, with some of its associated infrastructure located within the Project Site. Remediation system infrastructure (found on-site) associated with the MEW extraction and treatment system includes several recovery wells and underground piping. Treated water from the MEW facility is discharged into San Francisco Bay.

3.9.2.2 Historical Hazardous Materials Impacts and Prior Environmental Investigations[3]

As mentioned, Project Site soil and groundwater are affected by contamination associated with the MEW Companies past activities and U.S. Navy's past operations at Naval Air Station Moffett Field. The Project Site is within the footprints of both the MEW Superfund Site and former NAS Superfund Site. The MEW Superfund Site has undergone multiple environmental investigations along with soil and groundwater remediation for approximately three decades. Groundwater remediation associated with the site has been assigned to the MEW Regional Groundwater Remediation Program (RGRP), the Navy, and NASA. Remediation activities in the vicinity of the Project Site continue to be implemented under the jurisdictions of the EPA and the Regional Water Board. As the operator and property owner, NASA is also performing cleanup of the portions of the Naval Air Station Moffett Field where NASA was responsible for contamination. Also, NASA is responsible for implementing Land Use Controls at the site. Long-term remedies to address Naval Air Station Moffett Field contamination include sediment and soil excavation, treatment, and off-site disposal.

As a result of investigations and remedial actions that have been performed within the Project Site, the identified environmental conditions and primary chemicals of potential concern (COPCs) that need to be considered during redevelopment are:

- The presence of chlorinated VOCs in groundwater, soil gas, and soil within the Project Site, predominantly resulting from the migration of contaminated groundwater from the upgradient MEW Superfund Site as well as NASA sources within NASA ARC; the primary chlorinated VOC COPCs associated with the MEW Superfund Site are trichloroethene (TCE) and cis-1,2-dichloroethene, although several other VOCs are frequently detected; as of September/October 2024, the maximum concentration of TCE detected in groundwater within the Project Site was 570 micrograms per liter (ug/L) at location REG-4A;[4]

[3] Prior environmental investigation summaries were included in the EIR/EIS to provide the most current environmental condition information available when describing the Project Site's environmental setting. These annual vapor intrusion and groundwater remediation progress reports are routine and ongoing. Moreover, the information in these annual progress reports (up through the versions that were publicly available prior to the publication of the joint EIR/EIS) do not change the conclusions or recommendations in the Berkeley Space Center at NASA Research Park - Hazardous Material Conditions technical memorandum prepared by EKI in November of 2025.

[4] Geosyntec. 2025. *2024 Annual Progress Report – Middlefield-Ellis-Whisman Fairchild and Regional Groundwater Remediation Programs, Mountain View, California*. April 15.

- Fuel oil and solvent tanks associated with the former dry cleaning facility (Tanks 67 and 68, respectively) in 1990 and the mid-1990s, respectively; tetrachloroethene was detected in a confirmation soil sample at a maximum concentration of 0.13 milligram per kilogram (mg/kg); Tank 67 was closed with a No Further Action letter from the Regional Water Board in 2000; Tank 68 and associated Sump 91 have not received regulatory closure and are considered to be part of IR Site 28, an active Navy remediation site; and
- The presence of total petroleum hydrocarbons (TPH) and other fuel-related constituents, including BTEX compounds, in groundwater and in soil within the Project Site, including, but not limited to:
    - TPH associated with Tanks 86A and 86B, two USTs that were removed in 1993 and closed with a No Further Action letter from the Regional Water Board in 2000; TPH as gasoline was not present in groundwater above the reporting limit of 50 ug/L at the time of closure;
    - TPH and BTEX associated with Tank 110, a former diesel UST located north of Building 109, were reportedly not detected in soil and groundwater samples collected at this UST; Tank 110 was closed with a No Further Action letter from the Regional Water Board in 2000;
    - TPH associated with Tanks 33 through 40 (eight USTs) and Sump 42 at and near the NEX Service Station, which were removed from 1990 to 1993 and closed in a No Further Action letter with use restrictions from the Regional Water Board in 2011;
    - TPH associated with hydraulic lifts, a hydraulic oil reservoir tank, a waste oil line, and a subgrade clarifier at the NEX Service Station, which were closed in a No Further Action letter with use restrictions from the Regional Water Board in 2015; the confirmation soil samples collected in the vicinity of the hydraulic lifts contained up to 22,000 mg/kg TPH as hydraulic oil, but the extent of impact was limited based on follow-up soil samples collected in 2012; TPH as hydraulic oil and as motor oil in groundwater were 300 ug/L and 220 ug/L, respectively, at the time of closure in 2015;
    - TPH associated with Sump 25 at IR Site 15, which was closed in a No Further Action letter with use restrictions from the Regional Water Board in 2011; the confirmation soil sample contained purgeable TPH as jet fuel at a concentration of 5,800 mg/kg and TPH as diesel at 9,500 mg/kg and the grab groundwater sample from the excavation pit contained purgeable TPH as jet fuel at 100 ug/L and TPH as motor oil at 3,300 ug/L;
- The presence of per- and polyfluoroalkyl substances (PFAS) compounds in groundwater within the Project Site[5] resulting from multiple historical site uses, including:
    - Perfluorooctanoic acid at up to 7.3 nanograms per liter (ng/L);
    - Perfluorooctanesulfonic acid at up to 14 ng/L; and
    - Perfluorobutanesulfonic acid at up to 16 ng/L;
- The potential presence of elevated concentrations of polychlorinated biphenyls (PCBs) in soil surrounding buildings or transformers;
- The potential presence of elevated concentrations of lead in soil surrounding buildings;
- Existing subsurface structures (e.g., sumps or tanks) that may need to be removed; and

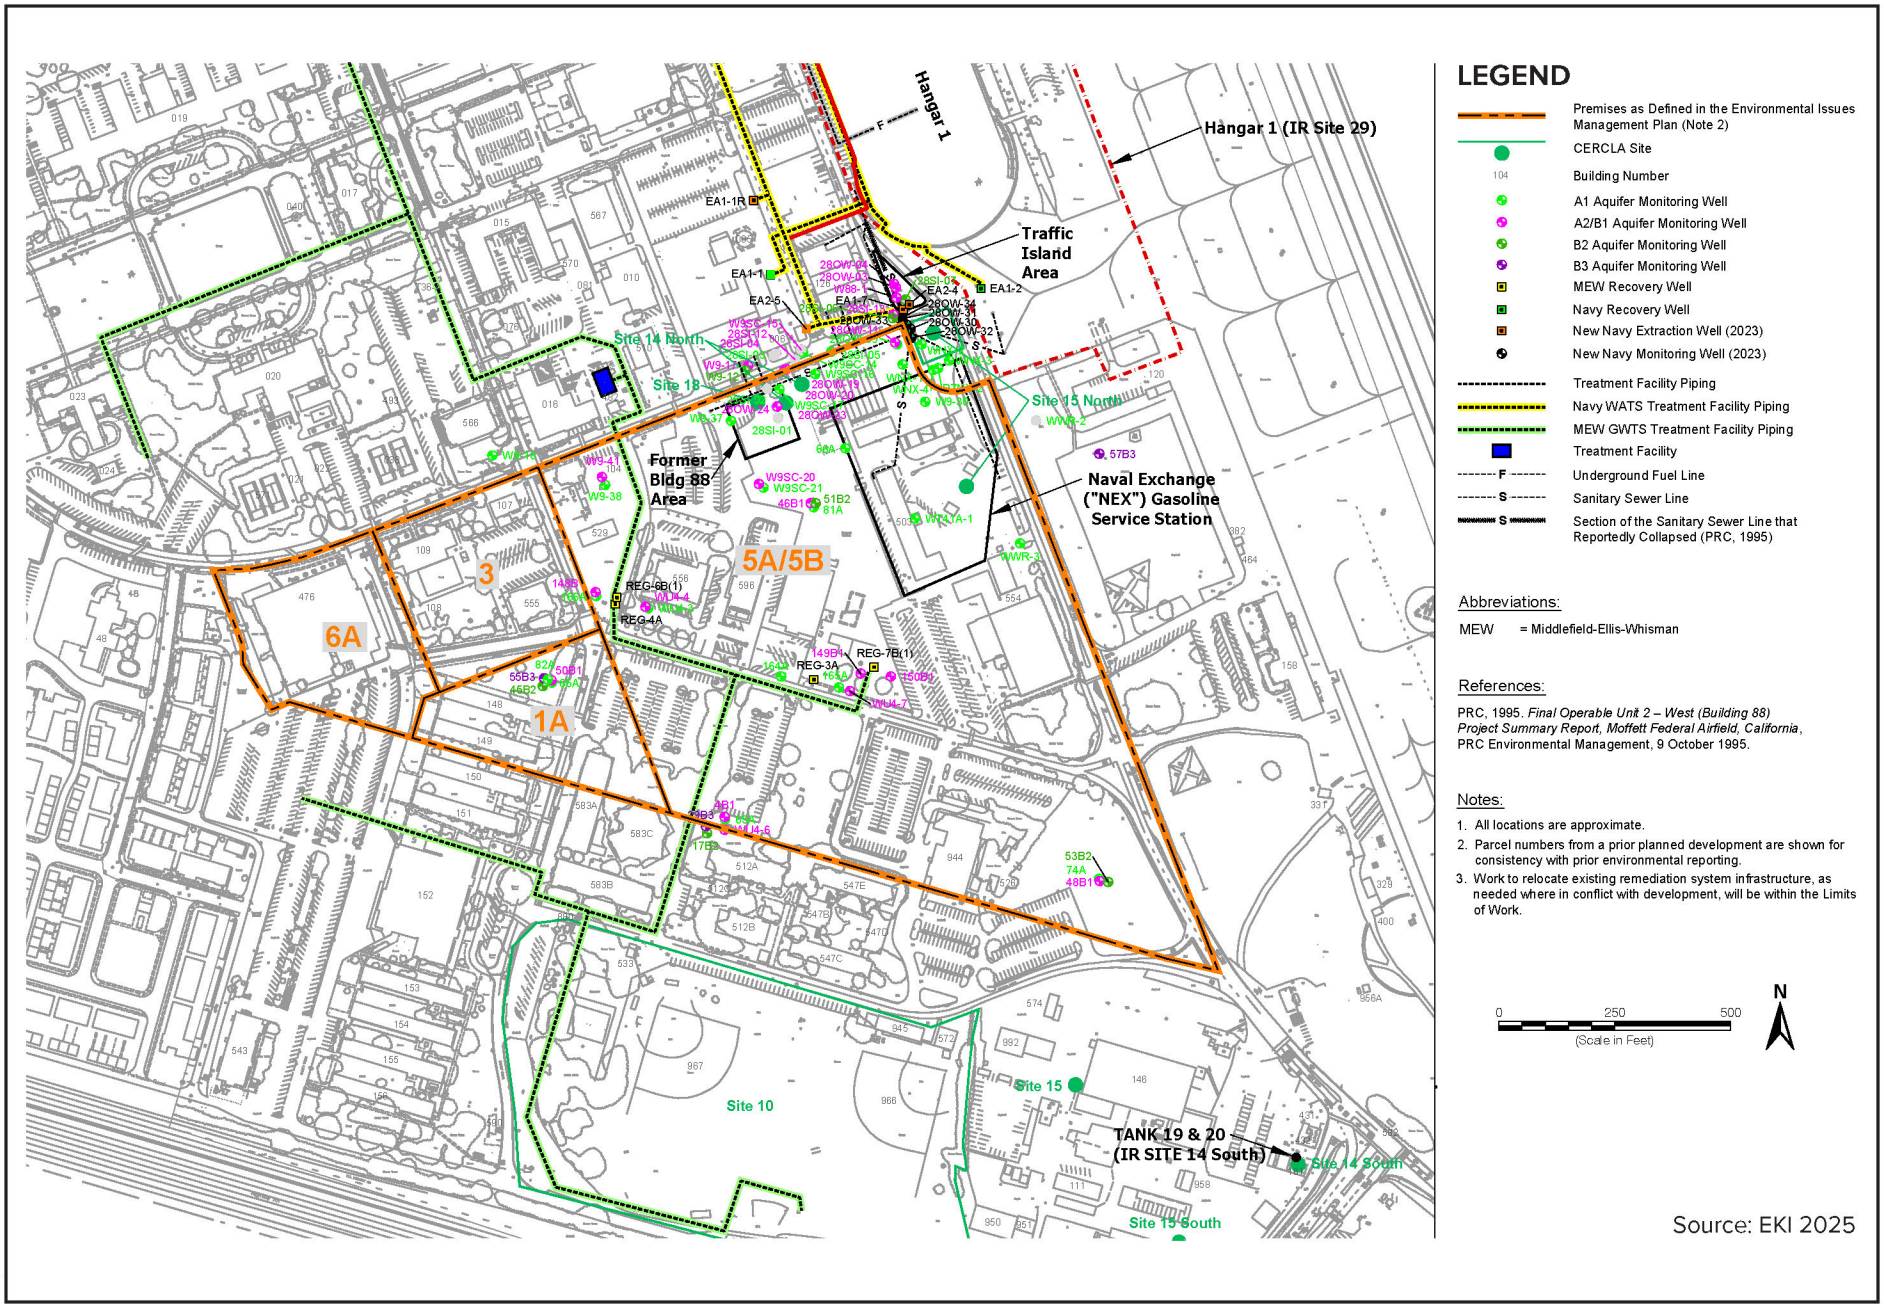
5 Tetra Tech. 2023. *Per- and Polyfluoroalkyl Substances, Site Inspection Report for NASA Ames Research Center.* April.

- Building materials containing hazardous materials (e.g., asbestos-containing materials, lead-based paint, and PCB-containing materials in existing buildings).

Responsible Parties and Oversight

The Navy began conducting a remedial investigation/feasibility study for Naval Air Station (NAS) Moffett Field, coordinating its actions through a Federal Facility Agreement (FFA) with EPA; the California Environmental Protection Agency (CalEPA), including DTSC; and the Regional Water Board. Nearly all of the area known as Moffett Field, with the exception of two housing areas, was transferred to NASA in 1994. In accordance with the transfer documents and a 1994 amendment to the Navy Moffett Field FFA, the Navy retained all Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) response authority for Moffett Field, while NASA became responsible for ongoing environmental operations. In addition, as the land manager at Moffett Field after 1994, NASA is responsible for implementation of institutional controls for Navy response actions. In 2014, EPA, the Regional Water Board, and NASA entered into a NASA-specific Moffett Field FFA which includes NASA's responsibilities at Moffett Field for addressing contamination within areas of contamination where NASA itself is responsible and for implementing institutional controls for the areas where it has responsibility as the land manager of NRP.[6]

Remediation Activities Undertaken by Responsible Parties



As indicated above, the MEW Companies have installed and are operating a groundwater remediation system on the Project Site that includes groundwater monitoring wells for groundwater remediation systems for both the MEW Companies and the Navy[7,8] as part of ongoing Remediation Activities (Project Site remediation is described in Section 3.9.2.2, *Historical Hazardous Materials Impacts and Prior Environmental Investigations*, and under *Existing Environmental Conditions* in the Spring 2026 project-specific EIMP). Figure 3.9-1, Locations of MEW and NAVY Monitoring Wells, Recovery Wells, and Treatment System Piping-Existing Layout, shows the locations of existing monitoring wells, recovery wells, and treatment system piping. The MEW Companies will continue operation of the groundwater remediation system; however, as discussed below, the Project Proponent is required to coordinate with the Responsible Parties if these systems need to be re-located to accommodate the development. Such relocations are required to be approved by EPA and the Regional Water Board to ensure that the impacts to the efficacy of the system are minimized. The cost of such equipment relocation is typically borne by the Project Proponent; the re-location activities will be performed either by the Responsible Parties or the Project Proponent depending on agreements between the parties.

6 The Project Proponent's ground lease with NASA requires "Tenant [receiving] from EPA a Bona Fide Prospective Lessee Agreement or Prospective Lessee Agreement in form and substance satisfactory to Tenant." Tenant/Project Proponent is currently engaged in negotiations with EPA for this agreement referred to as the Covenant Not to Sue for the Project Site.

Berkeley Space Center at NASA Research Park

2024 Annual Vapor Intrusion Progress Report Former Fairchild and Regional Groundwater Remediation Program Properties Middlefield-Ellis-Whisman Vapor Intrusion Study Area Mountain View, California

An annual vapor intrusion progress report was prepared by Geosyntec Consultants in April 2025 to summarize activities performed in 2024 related to vapor intrusion (VI) investigation, VI control system remedial design and construction, and the operation, maintenance, and monitoring (OM&M) of VI control systems operating at buildings located on the former Fairchild properties and properties within the RGRP at the MEW Superfund study area. It should be noted that the study area covered in the 2024 progress report includes structures located within the Project Site, but it also includes areas both to the north and south. The 2024 progress report provided updates on several of the structures within the study area; however, none of the updates included buildings within the Project Site. Sites within the Project Site were identified in the progress report as Moffett Field buildings B503, B554, B556 and B596.

An update was provided for Moffett Field building 20, located approximately 500 feet to the west of the Project Site. From March 28 to May 13, a basement ventilation system was shut down to address potential safety issues related to the ventilation system fans. During the shutdown, one fan was replaced and NASA assessed and upgraded the electrical service to both fans. A subsequent annual inspection (July 10) confirmed the basement ventilation system was operating adequately. Ongoing OM&M of the VI control systems listed in the report, along with required reporting, would continue in 2025.

2024 Annual Progress Report Middlefield-Ellis-Whisman Fairchild and Regional Groundwater Remediation Programs Mountain View, California

An annual progress report was prepared by Geosyntec Consultants in April 2025 to summarize activities and progress associated with the ongoing groundwater remediation programs associated with the former Fairchild Semiconductor Corporation facilities within the MEW Superfund study area and the MEW RGRP.

Groundwater remedies currently employed in the study area include slurry wall containment (at some source sites) and/or groundwater extraction and treatment. The groundwater extraction and treatment systems are designed to protect local water supplies, remediate or control groundwater that contains elevated concentrations of constituents of concern, and control discharge of such groundwater to surface water. Groundwater extracted from the regional plume north of U.S. 101 (including groundwater from the Project Site) is conveyed to the North 101 Treatment System, located at the corner of Wescoat Road and McCord Avenue on Moffett Field, directly adjacent to the Project Site. As stated above under *Historical Hazardous Materials Impacts*, remediation system infrastructure (on the Project Site) associated with this extraction and treatment system includes several recovery wells and underground piping. Treated North 101 Treatment System water is monitored, sampled and discharged to Stevens Creek directly. Effectiveness of the treatment systems are evaluated using a network of monitoring and recovery wells.

According to the progress report:

- Remediation systems are functioning as intended.

- Groundwater capture is adequate. Groundwater elevations and gradients, graphical flow net analysis, capture zone width calculations, and VOC concentration trends provide evidence that groundwater remediation is achieving adequate horizontal and vertical capture of the MEW plume.
- VOC concentrations are decreasing over time.
- Horizontal and vertical gradients are generally consistent with historical observations.

In 2023, the North 101 Treatment System removed 225 pounds of VOCs from 44.8 million gallons of extracted groundwater. Extraction and treatment of groundwater, sampling and reporting would continue in 2025.

CY2024 Annual Progress Report NASA Ames Regional Groundwater Remediation Program NASA Area of Responsibility and Site 28 WATS Area

An annual progress report was prepared by BB&E Consulting in April 2025 to summarize activities and progress associated with the ongoing groundwater remediation programs associated with the NASA Ames Groundwater Area of Responsibility to the MEW Regional Plume and the Navy Site 28 WATS Area. NASA Ames operates the NASA groundwater treatment system within NASA Ames' Groundwater Area of Responsibility. As of 2016, NASA assumed operational, maintenance, monitoring and reporting responsibilities for the Navy Site 28 WATS Area from the Navy (who originally installed and operated the system). The WATS is located within the Navy Site 28 Area, west of Hangar 1 in Building 45A on Cummins Avenue (and is the closest system to the Project Site, located approximately 980 feet to the northwest).

Groundwater remedies currently employed in the study area include groundwater extraction and treatment with the objective of mass removal and hydraulic containment of VOC-contaminated groundwater. The remediation approach is designed to protect local water supplies by remediating and controlling groundwater that contains elevated concentrations of MEW contaminants of concern (COCs), including control of discharge of such groundwater to surface water. In the southern portion of the NASA RGRP area (the Project Site is part of this portion of the NASA RGRP area), 12 extraction wells located within Site 28 pump water to the WATS. It should be noted that in August 2024, the WATS was retrofitted with a larger ozone generator in preparation for the removal and bypass of the Navy Pretreatment System (which operated concurrently with the WATS since 2022). The effectiveness of the systems is monitored using a network of RGRP monitoring wells.

According to the progress report:

- Remediation systems are functioning as intended.
- Graphical flow net analysis, capture zone width calculations, spatial distribution analysis, chemical concentration trends and contour mapping provide evidence that groundwater remediation is achieving adequate capture and hydraulic control of targeted treatment zones.
- Total VOCs concentrations in the core of the plume have decreased significantly since 1999. In the A1 Aquifer, core concentrations in Site 28 have decreased by 81 percent. In the A2/B1 Aquifer, core concentrations in Site 28 have decreased by 83.5 percent.

In 2024, the WATS removed 160.6 pounds of VOCs from 28.5 million gallons of extracted groundwater. Extraction and treatment of groundwater, groundwater level measurements, sampling, and reporting would continue in 2025.

Supplemental Environmental Database Review

ICF conducted a supplemental environmental database review in August 2025 on the State Water Resources Control Board's (SWRCB's) GeoTracker[9] and the DTSC's EnviroStor[10] websites to search for site listings (with the potential to impact project implementation) within the Limits of Work that may have been newly added between the preparation/publishing of the reports discussed above and the preparation of this EIR/EIS. Several Military Cleanup Site and Military UST Site listings were identified within the Project Site; however, all were listed with a *Case Closed* status, indicating that they have been remediated to the satisfaction of the applicable oversight agency. Only one *active* Military Privatized Site was identified within the Project Site. It was listed as: "Berkeley Space Center Project Site – Edquiba Road Parcels 1A, 3, 5A, 5B, and 6A (SWRCB ID T10000013875)," with a status of *Open - Long Term Management as of 9/30/2020*. Potential contaminants of concern and potential media of concern were not disclosed. The Military Privatized Site listing was generated in 2019 when the case begin date was recorded in GeoTracker. As such, no newly listed sites not already considered in the previous investigations (presented above) were identified as a result of the supplemental environmental database review.

3.9.2.3 Spring 2026 Project-Specific Environmental Issues Management Plan

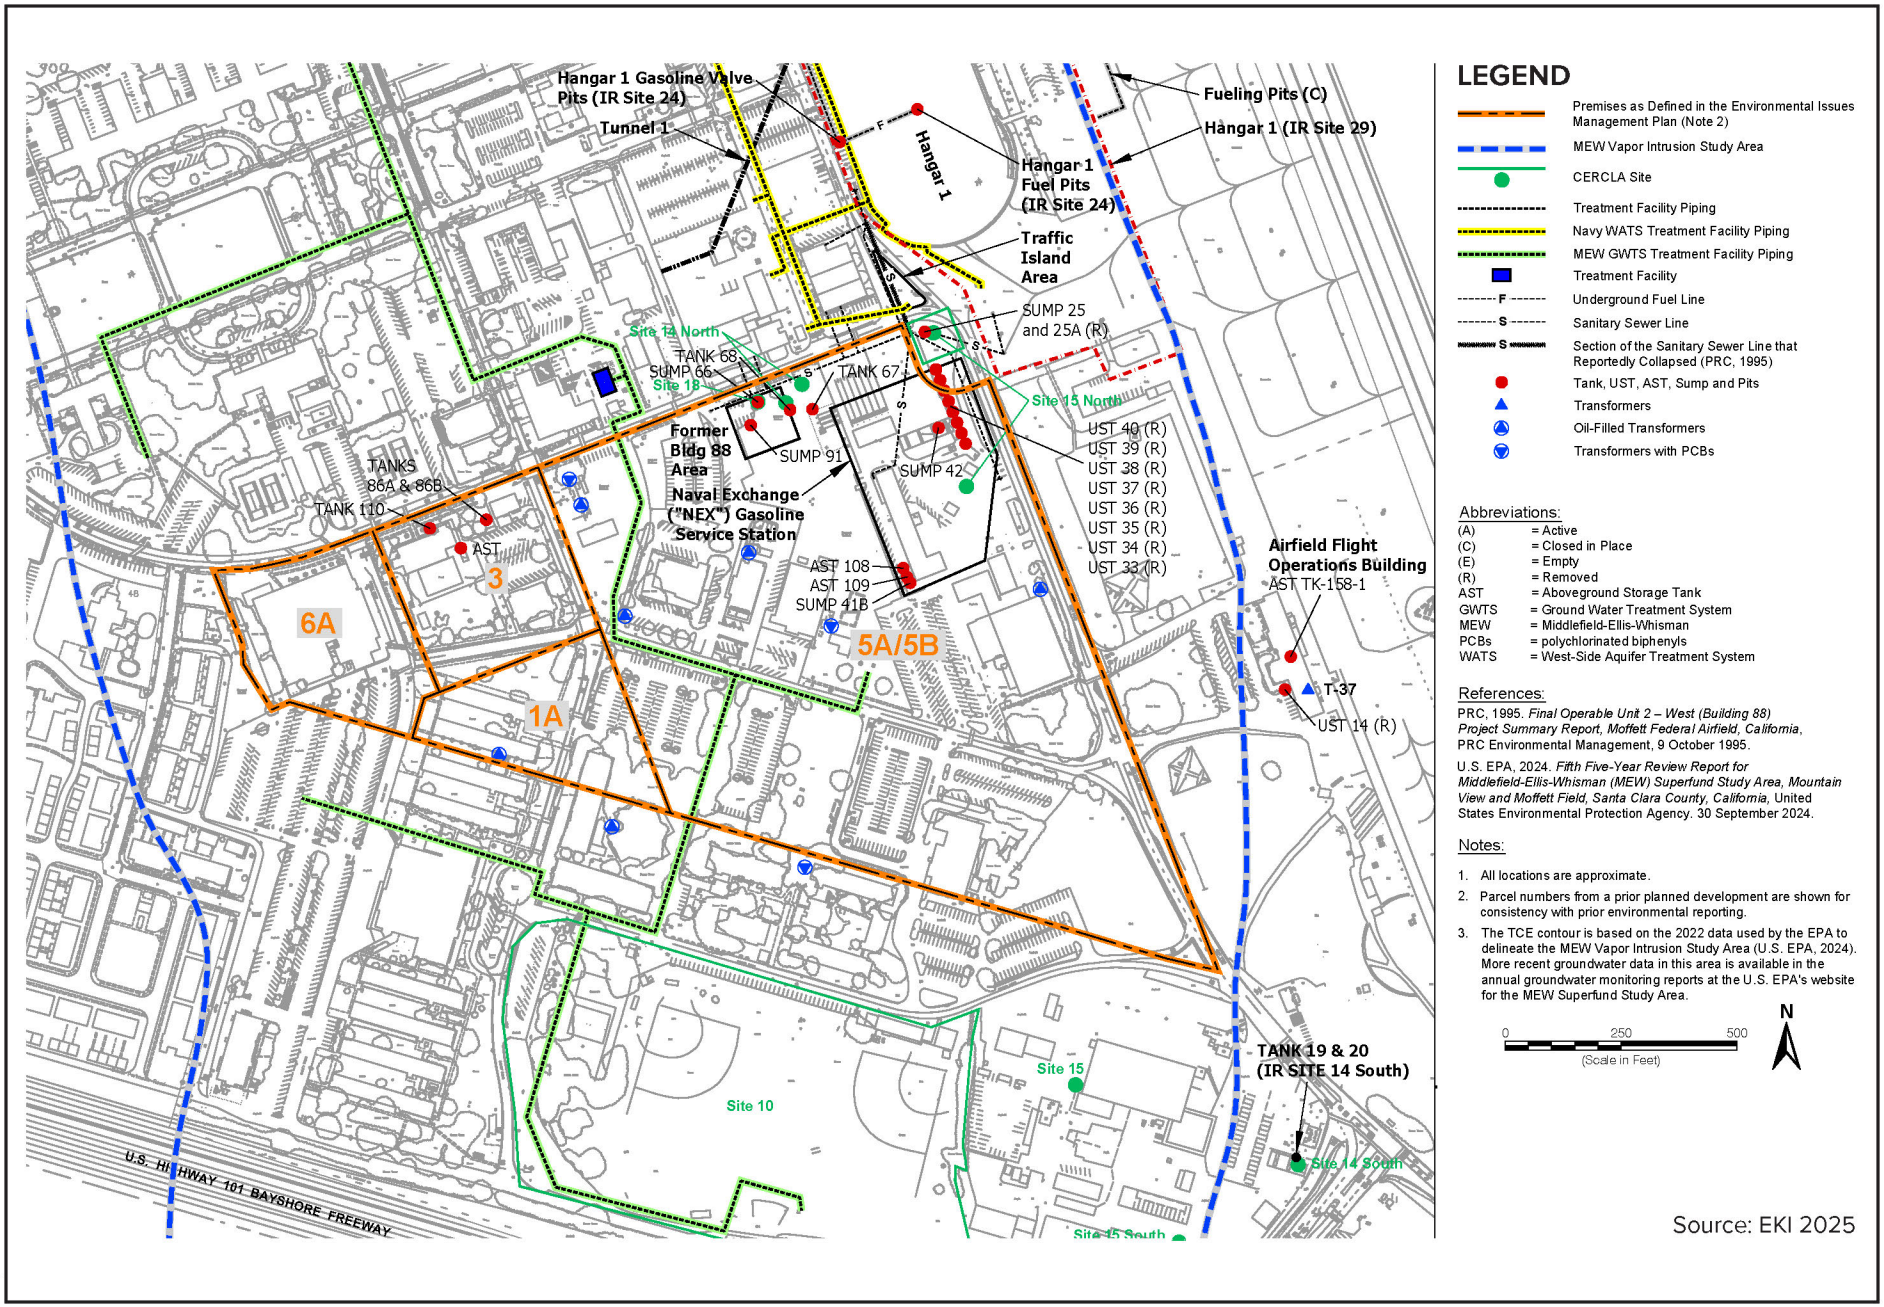
As mentioned, numerous soil and groundwater investigations have been conducted within the Project Site. The results of these investigations are summarized in various technical memoranda, remedial investigation and feasibility study reports and other documents. The Spring 2026 project-specific EIMP (summarized here) was prepared relying on the findings and conclusions of those documents. Implementation of the Spring 2026 project-specific EIMP is required for project implementation and is included in this EIR/EIS as a mitigation measure. The Spring 2026 project-specific EIMP was submitted to and reviewed by NASA, the EPA, and the Regional Water Board. Prior to commencement of construction of the proposed project, the EPA and the Regional Water Board will review and approve the Spring 2026 project-specific EIMP. The Spring 2026 project-specific EIMP will also be periodically reviewed and any necessary updates or addenda to the Spring 2026 project-specific EIMP will be reviewed by NASA and submitted to the EPA and Regional Water Board for approval.

The implementation of the Spring 2026 project-specific EIMP by the Project Proponent is not intended to relieve the Responsible Parties of their responsibilities and ongoing obligations. Rather, the Spring 2026 project-specific EIMP allocates as between NASA and the Project Proponent who will take actions to address environmental conditions in the event of non-performance or delayed performance by another Responsible Party, but such actions will not result in Project Proponent (including tenants and project developers) becoming a Responsible Party.

---

9 State Water Resources Control Board. 2026. *GeoTracker*. Available: https://geotracker.waterboards.ca.gov/. Accessed: January 1, 2026.

10 Department of Toxic Substances Control. 2026. *EnviroStor.* Available: https://www.envirostor.dtsc.ca.gov/public/. Accessed: January 6, 2026.



The Spring 2026 project-specific EIMP builds upon the prior 2005 NRP EIMP (and a subsequent 2007 Addendum). The Spring 2026 project-specific EIMP has been updated to reflect current regulatory requirements[11] and includes more detailed procedures specific to the Project Site. The Spring 2026 project-specific EIMP was prepared to provide requirements to be implemented before, during, and after development for the protection of human health and the environment during construction and occupancy. A Settlement Agreement and Covenant Not to Sue (currently in draft form) is being entered into between the Project Proponent, Moffett Partners, LLC, and the United States Department of Justice and United States Environmental Protection Agency Region 9 (Covenant Not to Sue), with respect to the Project Site. The Covenant Not to Sue provides the Project Proponent with certain liability relief in consideration of a monetary payment, a phytoremediation project, and implementation of the Spring 2026 project-specific EIMP within the Limits of Work.

The Spring 2026 project-specific EIMP was prepared with input from EPA and the Regional Water Board as lead regulatory agencies for the NAS Superfund Site as well as input from the EPA as the lead regulatory agency for the MEW Superfund Site to provide a decision framework for the management of residual chemicals in soil, groundwater, and existing and future structures within the Project Site during occupancy and development. The Spring 2026 project-specific EIMP includes required procedures that must be followed to address the known remaining environmental conditions within the Limits of Work and contingency actions to be taken in the event previously-unknown environmental conditions are encountered during development in the Limits of Work. The purpose of the Spring 2026 project-specific EIMP is to provide sufficient information to Project Stakeholders (NASA, Project Proponent, developers, and tenants) to comply with land use restrictions and land use controls (LUCs) and identify reasonable steps that help ensure project occupancy and development activities proceed in a manner that is protective of human health and the environment and is coordinated with the ongoing response actions of the Responsible Parties. Figure 3.9-2, Installation Restoration Program Site Locations and Current and Former UST, AST, and/or Sump Locations, shows the locations of the aforementioned features within the Project Site and Limits of Work. Figure 3.9-3, Navy and MEW Companies Allocation Areas, Soil and Groundwater, shows the Responsible Parties for soil and groundwater within the Project Site and the Limits of Work. Figure 3.9-4, NASA, Navy, and MEW Companies Areas of Responsibility, Vapor Intrusion, shows the Responsible Parties for vapor intrusion (VI) issues within the Project Site and the Limits of Work.

The Spring 2026 project-specific EIMP provides a baseline of minimum design considerations for new construction, risk management measures to be implemented during construction within the Limits of Work, post-construction risk management procedures for future subsurface activities within the Limits of Work, as well as procedures for long-term compliance with the Spring 2026 project-specific EIMP, CERCLA, and other environmental requirements. The Spring 2026 project-specific EIMP directs Project Stakeholders with responsibility for activities within the Limits of Work to: (1) review available information concerning environmental conditions within the Limits of Work; (2) determine the adequacy of the Spring 2026 project-specific EIMP with respect to expected environmental conditions as well as the conditions actually encountered during development and the intended land use; (3) evaluate the current understanding of the health and environmental effects of identified COPCs, to the extent the understanding of health and environmental effects

[11] The Spring 2026 project-specific EIMP: (a) provides an updated description of exposure pathways, (b) discusses soil and groundwater TCLs provided in the 2005 NRP EIMP, (c) provides updated TCLs for groundwater and soil, and (d) provides TCLs for indoor air, soil vapor, and sub-slab vapor.

assumed in the Spring 2026 project-specific EIMP may change; (4) comply with applicable policies, laws and regulations; and (5) establish management procedures to ensure that risk management measures are properly implemented and maintained. NASA will monitor implementation of the Spring 2026 project-specific EIMP and the regulatory agencies will review and approve measures taken in accordance with the Spring 2026 project-specific EIMP. Table 3.9-1 summarizes the requirements in the Spring 2026 project-specific EIMP.

Table 3.9-1. Summary of Spring 2026 Project-Specific EIMP Requirements

EIMP Requirement [a,b]	Implementing Entity	Reviewing Entity	Approving Entity
Protect existing remedial and monitoring systems, or, otherwise, relocate groundwater remediation system features in conflict with development	Project Proponent and Responsible Parties	NASA	EPA, Regional Water Board, and/or Responsible Parties
Install vapor intrusion mitigation systems for buildings located within the MEW Site VI Study Area and conduct subsequent indoor air sampling	Project Proponent and Responsible Parties	N/A	NASA and EPA
Prevent potential pathways for COPC migration in groundwater and soil gas that could result from construction	Project Proponent	NASA, Santa Clara Valley Water District [c]	EPA and Regional Water Board [d]
Prepare a Project Information and Summary of Environmental Conditions (PISEC) in advance of development activities	Project Proponent	NASA, MEW Companies	EPA and Regional Water Board
Implement risk management measures during construction to mitigate potential risks to human health and the environment from COPCs	Project Proponent	NASA	EPA and Regional Water Board
Implement post-construction risk management measures for long-term risks to human health and the environment during non-construction activity	Project Stakeholders	NASA	EPA and Regional Water Board

Source: Hazardous Material Conditions Memorandum included in Appendix 3.9-1 of this joint EIR/EIS.

COPC = chemicals of potential concern; EPA = U.S. Environmental Protection Agency; MEW = Middlefield-Ellis-Whisman Fairchild; N/A = Same as Approving Entity; NASA = National Aeronautics and Space Administration; Regional Water Board = San Francisco Bay Regional Water Quality Control Board.

Notes:

[a] This table presents a summary of key Spring 2026 project-specific EIMP requirements, which are described in greater detail in *Risk Management During Project Design, Construction, and Operations* below; refer to the Spring 2026 project-specific EIMP for complete requirements.

[b] Additionally, all Project Stakeholders with responsibility for activities within the Limits of Work are required to: (1) review available information concerning environmental conditions within the Limits of Work; (2) determine the adequacy of the Spring 2026 project-specific EIMP with respect to expected environmental conditions as well as the conditions actually encountered during development and the intended land use; (3) evaluate the current understanding of the health and environmental effects of identified COPCs, to the extent the understanding of health and environmental effects assumed in the Spring 2026 project-specific EIMP may change; (4) comply with applicable policies, laws and regulations; and (5) establish management procedures to ensure that risk management measures are properly implemented and maintained.

[c] Driven piles are not included as part of the proposed project. The proposed project may include piles installed through other construction methods. The Spring 2026 project-specific EIMP provides for Santa Clara Valley Water District to review designs that include piles that extend to depths greater than 20 feet.

[d] Design reports for features that prevent potential pathways of COPC migration will be provided to the Regional Water Board and EPA for review and concurrence.

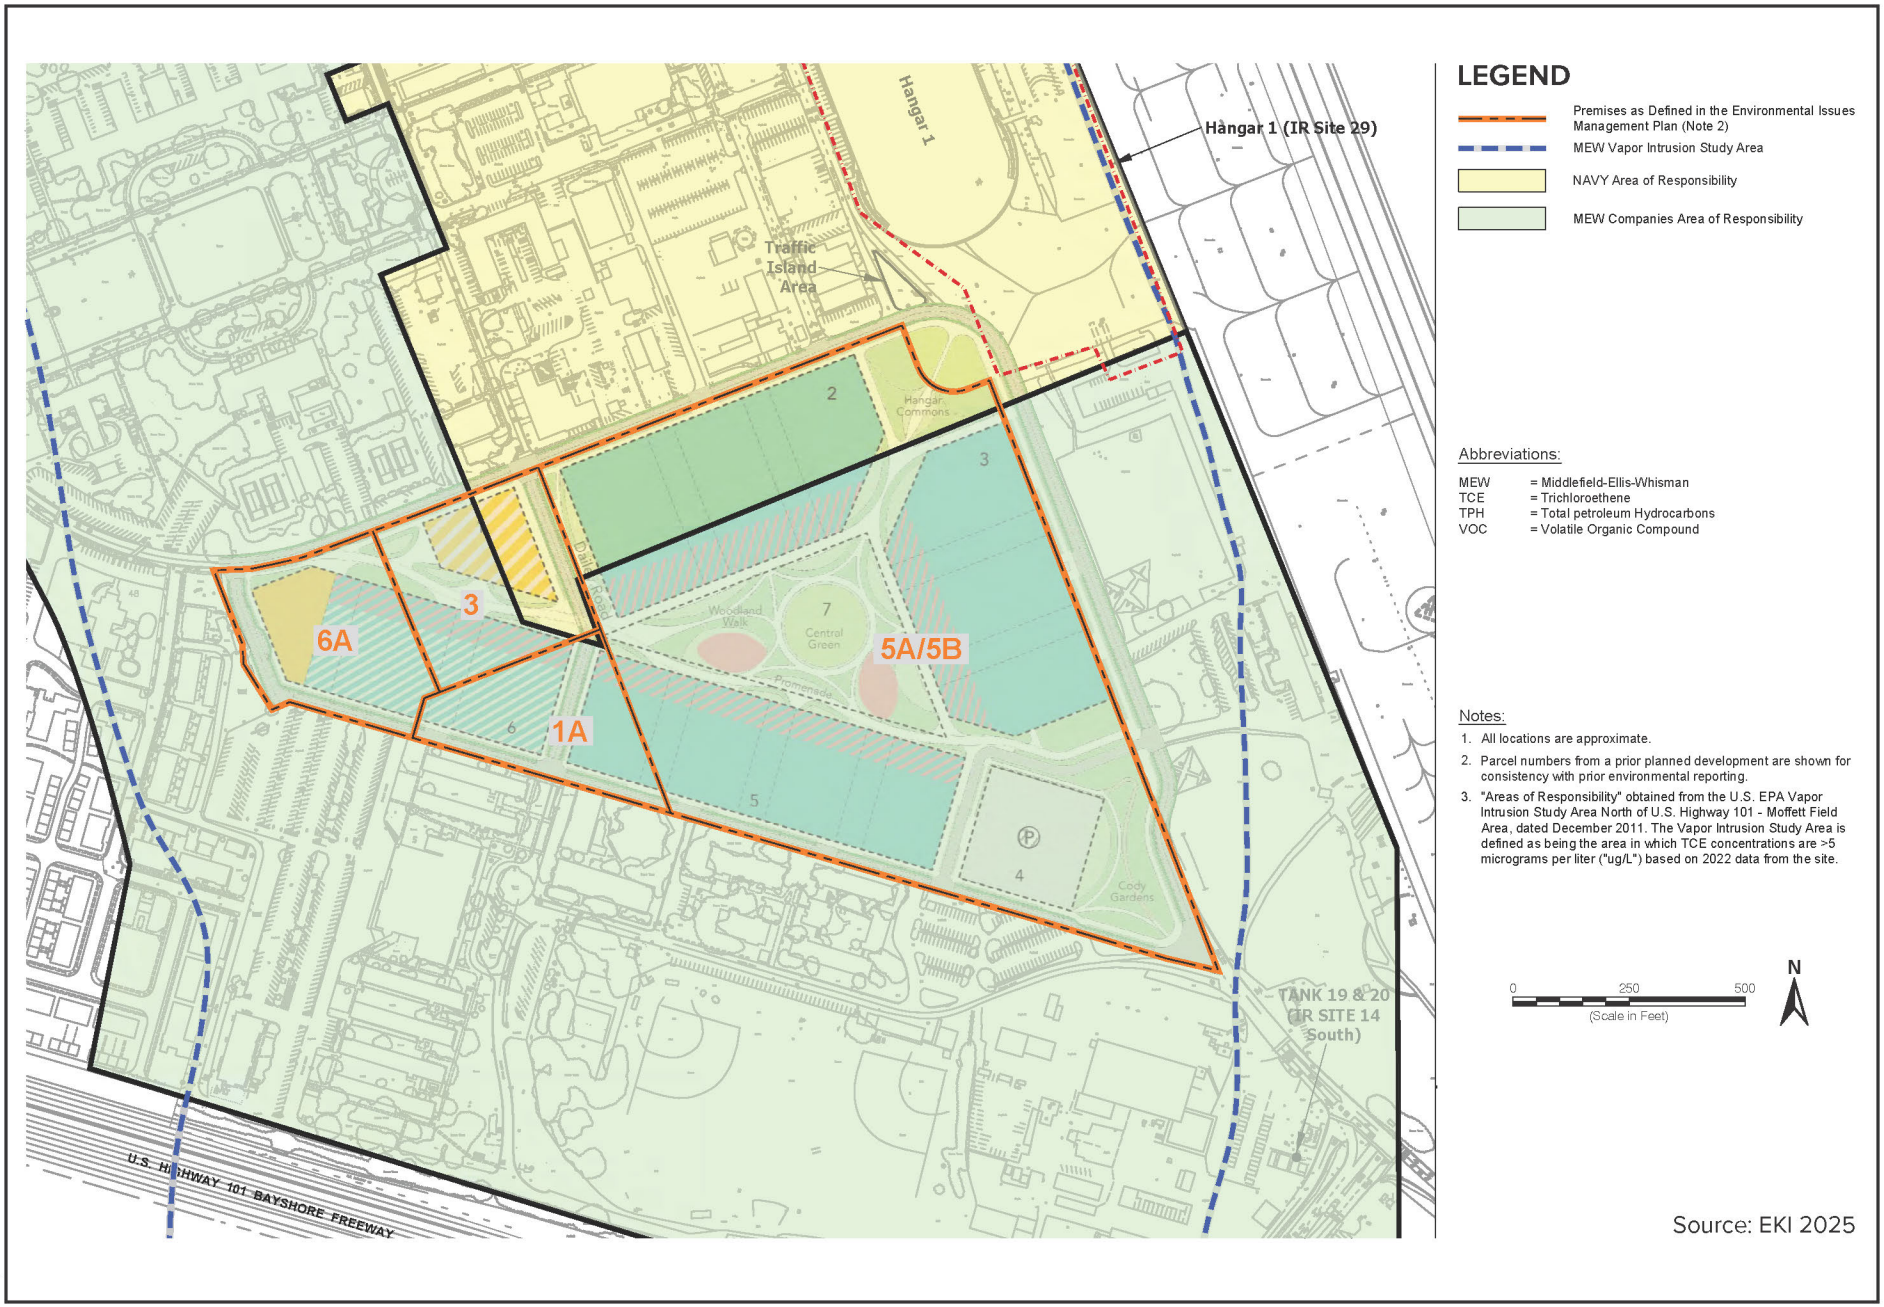
Risk Management During Project Design, Construction, and Operations

As discussed below, the measures described in the Spring 2026 project-specific EIMP address the potential risks from the inhalation of volatile chemicals from affected soil, groundwater, soil gas or sub-slab vapors, direct contact with affected soil, groundwater, or affected building materials, the inhalation of airborne particulates, and the ingestion of affected soil or groundwater such that human health is protected during and after development of the Project Site. All the measures described below are included in the Spring 2026 project-specific EIMP and are summarized herein. Unless otherwise indicated in the Spring 2026 project-specific EIMP, compliance with the Spring 2026 project-specific EIMP is overseen by EPA, the Regional Water Board, and/or NASA, depending on the specific activity being performed.

Redevelopment within the Project Site will be conducted in a manner that protects remedial and monitoring systems in place to the extent possible. Certain components of the existing remedial and monitoring systems, including wells and treatment system piping, will need to be relocated, modified, or replaced to accommodate the redevelopment; as described further below, these accommodations will be performed as necessary with minimal interference to the implementation of selected Site remedies. NASA will notify EPA and the Regional Water Board regarding relevant redevelopment and construction activities within the Project Site. Risk management activities described for development of the Project Site also apply to off-site improvements (i.e., within the Limits of Work) to support the development of the Project Site.

Risk Management Design Considerations for New Construction

Measures to Reduce Potential Exposure to VOCs in Indoor Air



COPCs in groundwater in some areas within the Project Site could potentially result in indoor air concentrations (through vapor intrusion from shallow groundwater or soil gas) above applicable Target Concentration Levels (TCLs). In its *ROD Amendment for the Vapor Intrusion Pathway at the MEW Superfund Study Area* (2010 VI ROD Amendment),[12] EPA defined the MEW VI Study Area (Figure 3.9-4) based on the approximate extent of the 5 ug/L TCE in shallow groundwater and developed different response actions for existing and future residential and commercial buildings within this area.

These response actions range from collecting annual indoor sampling to the installation of engineering controls (SSD/SMD) in order to address vapor intrusion in buildings over the shallow groundwater TCE plume referenced above.

To address this potential risk and as specified in the 2010 VI ROD Amendment, the selected remedy for future buildings located within the MEW Site VI Study Area with TCE above 5 ug/L is the installation of a vapor intrusion mitigation system (VIMS) either a passive sub-slab ventilation system that can be made active or an active sub-slab depressurization system, and indoor air sampling to confirm that there is no vapor intrusion risk. The Project Site (and all future buildings) are located within MEW Site VI Study Area with TCE above 5 ug/L and as described in the Spring 2026 project-specific EIMP, installation of a VIMS is required for each proposed building within the Project Site. The Spring 2026 project-specific EIMP requires NASA and EPA review and approval of the design of the VIMS for each

[12] U.S. Environmental Protection Agency. 2010. *Record of Decision Amendment for the Vapor Intrusion Pathway, Middlefield-Ellis-Whisman (MEW) Superfund Study Area, Mountain View and Moffett Field, California.* August 16.

A text description of this figure is provided in Chapter 9, *Descriptions of Figures*

Graphics ... 104894 (11-14-2025)

Figure 3.9-4

NASA, Navy, and MEW Companies Areas of Responsibility, Vapor Intrusion

Berkeley Space Center at NASA Research Park

building. The appropriate Responsible Party (Navy or MEW Companies) and EPA will require long-term access to conduct the appropriate building-specific monitoring to ensure the implemented VI remedy's effectiveness. On-going operation and management of the VIMS will be performed in accordance with a building-specific operations, monitoring, and maintenance plan to be prepared by the party operating the system once the VIMS has been constructed.

Long-term VI Monitoring Plans for the MEW Site VI Study Area will be developed by the Responsible Parties in accordance with the 2010 VI ROD Amendment and VI Statement of Work. The Long-Term VI Monitoring Plan for the MEW Companies was prepared in 2023 and submitted to EPA but has not yet been approved.[13] Until an approved VIMS program has been developed by the Responsible Parties for the larger MEW VI Study Area, the Master Lessee and the Project Proponent will work with EPA and the appropriate Responsible Party to develop a monitoring program to verify the long-term effectiveness of any implemented VI mitigation measures installed within the Project Site. The proposed project's VIMS must be approved by the EPA prior to occupancy of each building.

Measures to Mitigate Groundwater and Soil Gas Movement

Due to the groundwater contamination in the aquifer underlying the Project Site, the Spring 2026 project-specific EIMP describes required measures that will prevent new construction from creating potential pathways for migration of COPCs in groundwater or soil gas. For example, utility lines installed in trenches or horizontal boreholes in areas where contaminated groundwater or soil gas could potentially flow through utility line backfill material must include the use of low permeability backfill or cutoff walls to reduce potential contaminant migration. Driven piles are not included as part of the proposed project. The proposed project may include piles installed through other construction methods. The Spring 2026 project-specific EIMP requires Santa Clara Valley Water District to review and approved designs that include piles that extend to depths greater than 20 feet (i.e., potentially below the shallow aquifer affected by COPCs). The design will be evaluated for potential for driving affected soil deeper or creating conduits for downward contaminant migration, and measures to prevent migration of COPCs must be included in their design, if necessary. In both situations, the Project Proponent will prepare a design report for review and approval by NASA (and for Santa Clara Valley Water District review if piles are included in the proposed project) describing the measures that will be taken and demonstrating their effectiveness in preventing potential migration of COPCs. The Spring 2026 project-specific EIMP also requires the Project Proponent to submit the design report to EPA and the Regional Water Board for review and concurrence.

Protecting Existing Site Remedies

As presented in the Spring 2026 project-specific EIMP, procedures have been developed to allow for the modification of the existing remediation systems and their monitoring wells if potential conflicts occur between the planned development and the location of the existing systems; these procedures are presented in further detail in the Spring 2026 project-specific EIMP. Close coordination between the Project Proponent, NASA, the Navy, and/or the MEW Companies, as the case may be, and the applicable regulatory agencies, will occur during the design and construction phase of development

[13] Geosyntec. 2023. *Site-Wide Long-Term Vapor Intrusion Operation, Maintenance, Monitoring, and Management Plan, Middlefield-Ellis-Whisman Area and Moffett Field, California.* March 31. As of January 2026, the report has not been posted to the MEW Study Area Superfund Site webpage (https://cumulis.epa.gov/supercpad/cursites/csitinfo.cfm?id=0904966).

to ensure that measures are taken to protect implemented remediation systems[14] and monitoring wells (or remedies still being investigated or that are under development) for groundwater; any regulatory agency-approved modifications or disturbances[15] to the implemented remediation systems and monitoring wells will be appropriately repaired. Any such modifications will be within the Limits of Work, and are subject to approval by EPA, the Regional Water Board, NASA, and the Navy and/or the MEW Companies, as the case may be.

Preparation of Project Information and Summary of Environmental Conditions

For each phase of the proposed project, the Spring 2026 project-specific EIMP requires that a Project Information and Summary of Environmental Conditions (PISEC) to be prepared by the Project Proponent in advance of any development activities for the phase and provided to NASA, the MEW Companies, EPA, and the Regional Water Board. It is anticipated that project phasing will occur in clusters of two to four buildings per phase. The PISECs will include the following:

- Project description, including a description of the planned development activities for that phase of the Project and key health and safety information, as appropriate;
- Identification of project roles, including contact information for the Project Proponent, contractors, consultants, and oversight agency;
- Project schedule, including start date, phasing, and anticipated durations;
- Deviations from the Spring 2026 project-specific EIMP[16], if any;
- Summary of environmental conditions;
- Applicable land use restrictions and institutional controls; and
- References.

The PISEC for each area must be approved by the appropriate regulatory agencies (EPA and the Regional Water Board) prior to the start of construction activities.

Risk Management during Construction

The Spring 2026 project-specific EIMP summarizes risk management measures that must be implemented during construction to mitigate potential risks to human health and the environment from COPCs. These measures include:

- Review of available information to identify COPCs;
- Development and implementation of a Site-specific health and safety plan that describes health and safety training requirements for on-site workers, personal protective equipment to be used,

[14] Conveyance piping and extraction wells associated with the MEW Companies Ground Water Treatment System (GWTS) is located within the Project Site, and several of the monitoring wells associated with West-Side Aquifer Treatment System (WATS) are located within the Project Site (Figure 3.9-1). NASA has taken over responsibility of the operations, monitoring and maintenance of the WATS from the Navy. Navy monitoring wells are also located within the Project Site.

[15] Any disturbances to the implemented Site remedies must be timely reported to the Responsible Party, NASA, EPA, and Water Board.

[16] Any deviations from the Spring 2026 project-specific EIMP would require approvals from EPA and the Regional Water Board, and justification would be provided in the PISEC.

and other precautions to be undertaken to minimize direct contact with soil, groundwater, and soil vapors;

- Implementation of construction impact mitigation measures, such as implementing dust and odor control measures, decontaminating construction and transportation equipment, implementing storm water pollution controls, and sampling and analyzing groundwater extracted during construction to determine appropriate storage and disposal practices;
- Proper management of asbestos-containing material (ACM); debris and structures containing lead-based paint and/or PCB-containing paint; and PCB-containing equipment or building materials that are removed during development within the Project Site;
- Procedures for the management of abandoned USTs, sumps, pipes, and buried drums or containers that may be encountered during development activities within the Project Site;
- Procedures for the management of dewatering water generated during construction activities;
- Procedures for protecting implemented remedies and the existing groundwater remediation systems (including monitoring wells) during development activities within the Project Site and implementing any approved modifications to the remediation systems and/or remedies; and
- Procedures for the management of soil potentially affected by COPCs that is handled during construction activities. The soil management protocols include screening procedures to identify and manage COPC-affected soil that is excavated during development within the Project Site, as well as contingency procedures to be followed in the event that previously unknown soil contamination is encountered.

The Project Proponent will conduct the necessary environmental sampling and screening of soil and groundwater during development within the Project Site, as further required by the Spring 2026 project-specific EIMP. The Project Proponent will also be responsible for the necessary excavation and reconsolidation or removal of potentially affected soil or groundwater encountered within construction limits/boundaries during construction, as well as subsurface structures, such as unknown USTs that may be encountered within construction areas during construction excavation. The Project Proponent will dispose of potentially affected soils and subsurface structures at an appropriately permitted off-site facility in accordance with all applicable laws and regulations; NASA will be designated as generator of the wastes and will sign all waste manifests. Soil containing concentrations of heavy metals above TCLs may be reconsolidated under buildings or hardscape with EPA and Regional Water Board approval.

Depending on the area in which the excavation occurs and the COPCs detected in groundwater, the Spring 2026 project-specific EIMP provides three options for groundwater produced during dewatering of excavations: (a) used for dust control within the Project Site with NASA approval, (b) with permission of the Responsible Party for any existing or future groundwater treatment system, transported to such groundwater treatment system for treatment and ultimate disposal, or (c) discharged to the sanitary sewer (if a discharge permit can be obtained). Should the Project Proponent be unable to dispose of the dewatering water by one of the options listed above, the Spring 2026 project-specific EIMP requires that the Project Proponent arrange for the treatment and/or disposal of this water at a permitted off-site facility and NASA will be designated as generator of the wastes and will sign all waste manifests.

Post-Construction Risk Management

The Spring 2026 project-specific EIMP also describes precautions that must be implemented by Project Stakeholders to mitigate long-term risks to human health and the environment related to potential exposure to COPCs during periods of normal non-construction activity. These precautions include:

- Notification of future property managers and tenants of known environmental conditions within the Project Site, LUCs, and the requirements of the Spring 2026 project-specific EIMP via a statement of environmental conditions, which will include the key requirements specified in the Spring 2026 project-specific EIMP;
- Additional risk analysis and modification of the Spring 2026 project-specific EIMP, as appropriate, if any relevant change in land use is proposed for the Project Site, if there is a relevant change in any of the implemented remedies within the Project Site, or if any significant change in toxicity values or screening levels for COPCs occurs;
- Restriction of the use of groundwater within the Project Site for drinking water or any other purpose not allowed pursuant to the Spring 2026 project-specific EIMP unless its use is approved by NASA, EPA, the Regional Water Board, and the Santa Clara Valley Water District; exceptions include treated groundwater used for irrigation, industrial heating or cooling, or toilet water;
- Implementation of health and safety and other procedures similar to those described for construction activities at the Project Site for future activities that disturb subsurface soil (e.g., utility repairs) within the Project Site;
- Review of VI monitoring reports prepared by Responsible Parties who inspect, maintain, and monitor same, as they pertain to buildings located within the Project Site; any activity that disturbs the VIMS such as utility penetrations or slab disturbance is required to be repaired to restore the protectiveness of the VIMS (under oversight of applicable regulatory agencies);
- Compliance with LUCs within the Project Site;
- Cooperation with the Responsible Parties and regulatory agencies to provide reasonable access to areas of contamination or other areas upon which any environmental response action is or will be installed or implemented;
- Ongoing operation and maintenance as needed to verify the continued adequacy of implemented remedy, as required by environmental decision documents or the regulatory agencies; and
- Monitoring of changes in COPC toxicity parameters to assess if additional or lesser mitigation may be needed based on an updated understanding of chemical toxicity of reported COPCs within the Project Site.

Potential Exposure Pathways

The intended land uses for the Project Site include Research and Office Uses, Conference Center Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. As a result, the primary potential future receptors potentially include (a) construction workers and maintenance workers; (b) indoor workers, such as office personnel, students, and lab workers; (c) residents at the Student/Faculty Housing; and (d) visitors at the Short-Term Lodging. Potential future receptors may be exposed to COPCs by one or more of the following pathways:

- Inhalation of volatile chemicals from groundwater or soil;
- Dermal absorption due to direct soil and/or groundwater contact;
- Inhalation of airborne suspended soil particulates; and
- Incidental soil ingestion.

VOCs are the primary COPCs found within the Project Site. VOCs in groundwater and soil can volatilize into the pore spaces within unsaturated zone soils and migrate through the soil column and through cracks or penetrations in floors into enclosed indoor spaces, where they can be inhaled by potential receptors. The migration of COPCs from the subsurface into indoor air is called *vapor intrusion*. Vapor intrusion is the primary potentially complete exposure pathway[17] that could affect future indoor residents/visitors and workers within all portions of the Project Site, according to the Hazardous Material Conditions Memorandum.

Target Concentration Levels

Although cleanup standards have been developed for many areas at the Project Site, to simplify implementation of the Spring 2026 project-specific EIMP, TCLs were developed for soil, groundwater, sub-slab vapor, soil gas, and indoor air within the Project Site using (1) adopted cleanup levels in existing EPA decision documents, including the Record of Decision, Fairchild, Intel, and Raytheon Sites, MEW Study Area[18] and the ROD Amendment for the Vapor Intrusion Pathway at the MEW Superfund Study Area;[19] (2) the screening levels currently promulgated by applicable regulatory agencies, including the Regional Water Board's Environmental Screening Levels (ESLs)[20] for commercial/industrial or residential land use, EPA's Regional Screening Levels (RSLs)[21] for commercial/ industrial or residential land use, the California Maximum Contaminant Levels (MCLs),[22] the Federal MCLs,[23] and Toxic Substances Control Act (TSCA) regulations (40 Code of

[17] There are five elements of an exposure pathway:
- Source—how the stressor(s) enter the environment.
- Media—where a stressor moves from its source (air, soil, and/or water).
- Exposure—where receptors contact the media.
- Exposure Route—how the stressor(s) enter the receptor's body (ingestion, inhalation, dermal).
- Receptor—which plants and/or animals are exposed or potentially exposed.

These five elements must be present for an exposure pathway to be complete; otherwise, a pathway is incomplete and there is no exposure (https://www.epa.gov/ecobox/epa-ecobox-tools-exposure-pathways-exposure-pathways-era).

Federal Regulations [CFR] Section 761) for high occupancy areas, as appropriate; and (3) background concentrations for metals.[24]

Based on historic soil and groundwater data collected within the Project Site, TCLs were identified for several chlorinated VOCs, petroleum hydrocarbons and BTEX compounds, polycyclic aromatic hydrocarbons, PCBs, and Title 22 metals. In addition, PFAS compounds were detected in groundwater in sampling performed in 2021.[25] The Spring 2026 project-specific EIMP describes how the TCLs will be used to determine (a) groundwater management or disposal options; (b) whether excavated soil can be reused as fill within the Project Site and whether additional soil removal should be considered at locations where potential soil contamination is observed during development; and (c) whether vapor intrusion mitigation measures may need to be installed in existing buildings. The identified TCLs are also protective of short-term construction workers, maintenance workers performing periodic subsurface activities, indoor workers, students, and people living in/visiting the Student/Faculty Housing and Short-Term Lodging within the Project Site.

Cleanup levels for sites that are being addressed as part of the NAS Superfund Site and the MEW Superfund Site are those determined by the CERCLA lead agency and presented in the applicable cleanup documents.[26, 27]

3.9.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance. For the purposes of CEQA, UC Berkeley elected to use the Santa Clara Hazardous Materials Compliance Division, Santa Clara County Department of Environmental Health, Santa Clara County Airport Land Use Commission and Moffett Federal Airfield Comprehensive Land Use Plan, and Santa Clara County Operational Area Hazard Mitigation Plan, for the analysis of hazards and hazardous materials associated with the project.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction;

---

such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies. For the purposes of NEPA, NASA has elected to use the standards identified in the Santa Clara Hazardous Materials Compliance Division, Santa Clara County Department of Environmental Health, Santa Clara County Airport Land Use Commission and Moffett Federal Airfield Comprehensive Land Use Plan, and Santa Clara County Operational Area Hazard Mitigation Plan, and California Building Standards Code and California Fire Code as part of the analysis of hazards and hazardous materials associated with the project.

This section summarizes plans, policies, and regulations considered in the analysis.

3.9.3.1 Federal Regulations

Federal Toxic Substances Control Act/ Resources Conservation and Recovery Act of 1976, as amended by the Hazardous and Solid Waste Amendments of 1984

The Resource Conservation and Recovery Act (RCRA) gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The RCRA regulations are contained in title 40 of the Code of Federal Regulations (CFR) parts 239 through 282. Regulations include, hazardous materials storage requirements, emergency planning and training, identification and classification of wastes, permitting requirements, etc.

Comprehensive Environmental Response, Compensation, and Liability Act/Superfund Amendments and Reauthorization Act

The Comprehensive Environmental Response, Compensation, and Liability Act—otherwise known as CERCLA or Superfund—provides a federal "Superfund" to clean up uncontrolled or abandoned hazardous-waste sites as well as accidents, spills, and other emergency releases of pollutants and contaminants into the environment. Through CERCLA, EPA was given power to seek out those parties responsible for any release and assure their cooperation in the cleanup. The Superfund Amendments and Reauthorization Act (SARA) of 1986 reauthorized CERCLA to continue cleanup activities around the country. Several site-specific amendments, definitions clarifications, and technical requirements have been added to the legislation, including additional enforcement authorities. Title III of SARA authorized the Emergency Planning and Community Right-to-Know Act (EPCRA) identified below.

Occupational Safety and Health Administration

The Occupational Safety and Health Administration (OSHA) is a regulatory agency of the U.S. Department of Labor that originally had federal visitorial powers to inspect and examine workplaces. OSHA's Hazard Communication Standard (HCS) (29 CFR 1910.1200, 1915.1200, 1917.28, 1918.90, and 1926.59) is designed to ensure that information about chemical and toxic substance hazards in the workplace and associated protective measures is disseminated to workers. OSHA also establishes various Occupational Exposure Limits (OELs) as it relates to onsite respiratory hazards (associated with hazardous materials use).

Emergency Planning Community Right-to-Know Act

The Emergency Planning and Community Right-to-Know Act of 1986 was authorized by Title III of the Superfund Amendments and Reauthorization Act to help communities plan for chemical emergencies. The Community Right-to-Know provisions help increase the public's knowledge and access to information on chemicals at individual facilities, their uses, and releases into the environment. It requires industry to report on the storage, use, and releases of certain chemicals to federal, state, tribal, territorial, and/or local governments. It also requires these reports to be used to prepare for and protect their communities from potential risks.

Toxic Substances Control Act

The Toxic Substances Control Act (TSCA) of 1976 provides EPA with authority to require reporting, record-keeping and testing requirements, and restrictions relating to chemical substances and/or mixtures. Certain substances are generally excluded from the Toxic Substances Control Act, including, among others, food, drugs, cosmetics and pesticides. The TSCA directs EPA to:

- Maintain the TSCA Chemical Substances Inventory,
- require testing of chemical substances where necessary to evaluate potential human health or environmental hazards,
- regulate the manufacture, importation, processing, distribution, use, and/or disposal of any chemical substance that presents an unreasonable risk of injury to human health or the environment, and,
- coordinate certain actions on chemical substances under TSCA with actions taken under other federal laws, including those administered by other federal agencies as well as other laws administered by EPA.

Department of Transportation Hazardous Material Regulations (49 CFR 100–185)

The Hazardous Materials Regulations (HMR) issued by the U.S. Department of Transportation (USDOT) govern the transport of hazardous materials in interstate, intrastate, and foreign commerce. The primary goal of the HMR is the safety of the public and those whose occupations involve preparing hazardous materials for transportation or transporting them. To minimize risks, USDOT has issued specific requirements for shipments of hazardous materials in transportation. The HMR are divided into four general areas:

- Hazardous materials identification and classification;
- Hazard communication (shipping papers, markings, labels, and placards used to communicate hazards of the materials to emergency responders as well as those who handle hazardous materials routinely);
- Packaging requirements; and
- Operational rules.

The USDOT issues most of the “transportation” regulations in 49 CFR. The HMR are in the volume containing Parts 100–185 and govern the transportation of hazardous materials in all modes of transportation—air, highway, rail, and water. The CFR has the force of the law. The regulations are issued by federal agencies to carry out the responsibilities imposed on those agencies by Congress.

CFR, Title 29, Sections 1926.62 and 1910.120

CFR, Title 29, Section 1926.62 Lead

Scope. This section applies to all construction work where an employee may be occupationally exposed to lead. All construction work excluded from coverage in the general industry standard for lead by 29 CFR 1910.1025(a)(2) is covered by this standard. Construction work is defined as work for construction, alteration and/or repair, including painting and decorating. It includes but is not limited to the following:

1. Demolition or salvage of structures where lead or materials containing lead are present;
2. Removal or encapsulation of materials containing lead;
3. New construction, alteration, repair, or renovation of structures, substrates, or portions thereof, that contain lead, or materials containing lead;
4. Installation of products containing lead;
5. Lead contamination/emergency cleanup;
6. Transportation, disposal, storage, or containment of lead or materials containing lead on the site or location at which construction activities are performed, and
7. Maintenance operations associated with the construction activities described in this paragraph.

CFR, Title 29, Section 1910.120 Hazardous Waste Operations and Emergency Response

Scope. This section covers the following operations, unless the employer can demonstrate that the operation does not involve employee exposure or the reasonable possibility for employee exposure to safety or health hazards:

i) Clean-up operations required by a governmental body, whether federal, state, local or other involving hazardous substances that are conducted at uncontrolled hazardous waste sites (including, but not limited to, the EPA's National Priority Site List (NPL), state priority site lists, sites recommended for the EPA NPL, and initial investigations of government identified sites which are conducted before the presence or absence of hazardous substances has been ascertained);

ii) Corrective actions involving clean-up operations at sites covered by the RCRA, as amended (42 United States Code [U.S.C.] 6901 et seq.);

iii) Voluntary cleanup operations at sites recognized by Federal, state, local or other governmental bodies as uncontrolled hazardous waste sites;

iv) Operations involving hazardous wastes that are conducted at treatment, storage, and disposal (TSD) facilities regulated by 40 CFR Parts 264 and 265 pursuant to RCRA; or by agencies under agreement with EPA to implement RCRA regulations; and

v) Emergency response operations for releases of, or substantial threats of releases of, hazardous substances without regard to the location of the hazard.

CFR, Title 40, Parts 761, and 273

Part 761 of 40 CFR, Polychlorinated Biphenyls Manufacturing, Processing, Distribution in Commerce, and Use Prohibitions. This part establishes prohibitions of, and requirements for, the manufacture, processing, distribution in commerce, use, disposal, storage, and marking of PCBs and PCB Items. Substances that are regulated by this part include, but are not limited to: dielectric fluids; solvents; oils; waste oils; heat transfer fluids; hydraulic fluids; paints or coatings; sludges; slurries; sediments; dredge spoils; soils; materials containing PCBs as a result of spills; and other chemical substances or combinations of substances, including impurities and byproducts and any byproduct, intermediate, or impurity manufactured at any point in a process.

Part 273 of 40 CFR, Standards for Universal Waste Management. This part establishes requirements for managing the following:

1. Batteries as described in 40 CFR 273.2;
2. Pesticides as described in Section 273.3;
3. Mercury-containing equipment as described in Section 273.4;
4. Lamps as described in Section 273.5; and
5. Aerosol cans as described in Section 273.6.

Federal Aviation Administration Part 77

Federal Regulation Title 14, Part 77, establishes standards and notification requirements for objects affecting navigable airspace. This notification serves as the basis for:

- Evaluating the effect of the construction or alteration on operating procedures,
- Determining the potential hazardous effect of the proposed construction on air navigation,
- Identifying mitigating measures to enhance safe air navigation, and
- Charting of new objects.

Notification allows the Federal Aviation Administration (FAA) to identify potential aeronautical hazards in advance, thus preventing or minimizing the adverse impacts to the safe and efficient use of navigable airspace.

Hazardous Materials Transportation Act

The Hazardous Materials Transportation Act (HMTA), enacted in 1975, is the principal federal law in the United States regulating the transportation of hazardous materials. Its purpose is to "protect against the risks to life, property, and the environment that are inherent in the transportation of hazardous material in intrastate, interstate, and foreign commerce" under the authority of the U.S. Secretary of Transportation.

National Response Framework

The National Response Framework (NRF) is a guide to how the nation responds to all types of disasters and emergencies. It is built on scalable, flexible, and adaptable concepts identified in the National Incident Management System to align key roles and responsibilities.

The NRF is structured to help jurisdictions, citizens, nongovernmental organizations and businesses:

- Develop whole community plans
- Integrate continuity plans
- Build capabilities to respond to cascading failures among businesses, supply chains, and infrastructure sectors
- Collaborate to stabilize community lifelines and restore services

NASA Ames Development Plan

The NASA Ames Development Plan (NADP) is the long-term master plan for NASA's federal campus at Moffett Field published in 2002. The NADP details transformation of the original 500-acre campus of ARC and 1,500 acres of the former Naval Air Station Moffett Field into an integrated, dynamic research and education community. The transformation was led by the establishment of the NRP, a research-and-development campus for partners from academia, industry, and non-profit organizations with shared goals in support of NASA's mission.

The NADP includes planning principles that help guide the development throughout the entirety of NASA ARC. The planning principles include environmental issues management. The environmental issues management planning principle indicates that all partners will be required to comply with the NASA NRP EIMP (discussed below) and NASA Ames' Environmental Compliance Program.

Ames Environmental Procedures and Guidelines

The Ames Environmental Procedures and Guidelines ensure that NASA ARC meets all federal, State, and local hazardous material and hazardous waste regulations.

Ames Hazardous Waste Minimization Plan

A number of protocols are in place throughout NASA ARC to control the hazards associated with hazardous substances and to minimize the risks of exposure or spills. NPR and NASA ARC environmental work instructions ensure that the center meets all federal, State, and local hazardous materials and hazardous waste regulations. The Hazardous Waste Minimization Plan prescribes actions that will reduce NASA ARC's hazardous waste output.

Ames Hazardous Waste Disposal Procedures

The Hazardous Waste Disposal Procedures at NASA ARC require that all hazardous wastes be transported to secure, ventilated packaging areas, from which they are packaged and transported to state and federally authorized treatment or disposal sites.

NASA Research Park Environmental Issues Management Plans

The NRP EIMPs provide detailed information on environmental conditions, including existing LUCs, and a decision framework for management of residual contaminants in structures and environmental media. The EIMPs are updated periodically and as needed to incorporate new conditions, including LUCs. It should be noted that these NRP EIMPs do not apply to the proposed project.

Conversely, the Spring 2026 project-specific EIMP does apply to the proposed project and is described in detail in Section 3.9.2.3, *Spring 2026 Project-Specific Environmental Issues Management Plan*. The Spring 2026 project-specific EIMP draws upon information from the prior 2005 NRP EIMP and subsequent addenda and includes updates to reflect current regulatory requirements and to specifically address the Project Site (Spring 2026 EIMP, p. 1-2).

NASA Spill Prevention Control and Countermeasures Plan

Federal oil pollution prevention regulations are located in the CFR Title 40 Part 112. These regulations require the preparation and implementation of Spill Prevention, Control and Countermeasure (SPCC) plans for all non-transportation related facilities that store oil in excess of the quantities below and that have either discharged or could reasonably be expected to discharge oil into navigable waters of the United States or its adjoining shorelines:

- Aggregate aboveground container capacity greater than 1,320 gallons (only containers greater than or equal to 55 gallons are counted)
- Aggregate completely buried storage capacity greater than 42,000 gallons

3.9.3.2 State Regulations

California Environmental Protection Agency/Department of Toxic Substances Control

The California Environmental Protection Agency is a cabinet-level agency within the government of the State of California (State). The agency's mission is to restore, protect and enhance the environment, to ensure public health, environmental quality, and economic vitality. CalEPA enforces provisions in Government Code Section 65962.5, commonly referred to as the "Cortese List."

DTSC takes enforcement action against violators; oversees cleanup of hazardous wastes on contaminated properties; makes decisions on permit applications from companies that want to store, treat, or dispose of hazardous waste; and protects consumers against toxic ingredients in everyday products. DTSC's hazardous waste regulations are in CCR Title 22, Division 4.5, *Environmental Health Standards for the Management of Hazardous Waste*.

California Division of Occupational Safety and Health

The Division of Occupational Safety and Health of California (DOSH, but more commonly known as Cal/OSHA) is an agency of the Government of California established by the California Occupational Safety and Health Act of 1973.

Administered by the California Department of Industrial Relations, Cal/OSHA's mission is to protect public health and safety through research and regulation related to hazards on the job in California workplaces as well as on elevators, amusement rides, and ski lifts, and related to the use of pressure vessels such as boilers and tanks. Cal/OSHA requires qualifying organizations to create illness and injury prevention programs to identify and eliminate dangers before accidents and illnesses occur. Cal OSHA CCR Title 8 includes regulations associated with asbestos related work (Sections 341.6–341.14) and hazardous substances training and information (Sections 337–339).

California Office of Emergency Services

The State is responsible for mitigating the effects of disasters and protecting Californians' lives and property. The California Office of Emergency Services (Cal OES) serves as the state's leadership hub during all major emergencies and disasters. Cal OES mandates associated with evacuations are included under CCR Title 19 Public Safety Division 2.

Government Code Section 65962.5

California Government Code Section 65962.5 requires the California Environmental Protection Agency to develop at least an annually updated Cortese List.

The following are the data resources that provide information regarding the facilities or sites identified as meeting the Cortese List requirements:

- List of Hazardous Waste and Substances sites from the DTSC Brownfields and Environmental Restoration Program (Cleanup Program) EnviroStor database.
- List of Leaking Underground Storage Tank Sites from the State Water Resources Control Board's GeoTracker database.
- List of solid waste disposal sites identified by State Water Board with waste constituents above hazardous waste levels outside the waste management unit.
- List of Cease and Desist Orders (CDO) and Cleanup and Abatement Orders (CAO) from the State Water Board.
- List of hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code, identified by DTSC.

The EnviroStor database currently contains 575 sites, including the federal Superfund sites. It also maintains corrected and partially corrected sites, which are listed as certified with operation and maintenance sites.

Hazardous Waste Control Act (Section 25100 et seq.)

The Hazardous Waste Control Act (California Health and Safety Code Division 20, Chapter 6.5, Article 2, Section 25100, et seq.) authorizes DTSC and local certified unified program agencies to regulate facilities that generate or treat hazardous waste.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program

California Environmental Protection Agency Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program) was created in 1993 by SB 1082. The statutes and regulations are found in Health and Safety Code Division 20, Chapter 6.11, and CCR, Title 27, Division 1, Subdivision 4, Chapter 1, respectively. The Secretary of the California Environmental Protection Agency is responsible for coordinating and evaluating the administration of the Unified Program and certifying Unified Program Agencies (UPAs). UPAs are accountable for carrying out responsibilities previously handled by approximately 1,300 different State and local agencies.

State Water Resources Control Board Construction General Permit

The State Water Board adopted the statewide National Pollutant Discharge Elimination System (NPDES) Construction General Permit to regulate stormwater discharges associated with construction activities. The permit is applicable to construction projects that meet certain criteria. Generally, construction activities that disturb 1 acre of soil or more, or activities that disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 acre or more, are required to obtain coverage under the Construction General Permit. The permit does not apply to disturbances on land surfaces related solely to growing crops or performing agricultural operations, such as disking, harrowing, terracing, leveling, or preparing soil.

The NPDES Construction General Permit requires development of a Storm Water Pollution Prevention Plan (SWPPP) by a certified qualified SWPPP developer. A SWPPP is a site-specific plan for achieving compliance with stormwater regulations through the use of best management practices (BMPs).

California Labor Code Division 5, Parts 1, 6, 7, and 7.5

Division 5 regulates the conditions for a safe workplace. The Division of Occupational Safety and Health (DOSH, also known as Cal/OSHA) obtains its legal authority from this Division. DOSH's many responsibilities include inspecting nearly all elevators in California.

- Part 1: Occupational Safety and Health
- Part 6: Tanks and Boilers
- Part 7: Volatile Flammable Liquids
- Part 7.5: Refinery and Chemical Plants

California Building Standards Code and California Fire Code

The California Building Standards Code is the building code for California and Title 24 of the CCR. It is maintained by the California Building Standards Commission, which is granted the authority to oversee processes related to the California building codes by California Building Standards Law. The California building codes under Title 24 are based on several criteria: standards adopted by states, based on national model codes; national model codes adapted to meet California conditions; and standards passed by the California legislature that address concerns specific to California.

California Fire Code

The California Fire Code (CFC) is a set of regulations under the California Building Standards Code (Part 9) addressing fire safety and fire prevention in buildings and structures throughout the state. The 2022 CFC is based on the 2021 International Fire Code, with amendments and additions. The CFC contains regulations safeguarding life and property from dangerous conditions arising from the storage, handling, and use of hazardous materials.

California Health and Safety Code

The California Health and Safety Code is the codification of general statutory law covering the subject areas of health and safety in the state of California. It is one of the 29 California Codes and was originally signed into law by the governor of California on April 7, 1939.

The health and safety code is the section of California statutory law that addresses health, safety, health care, environmental law, and narcotics. Health and Safety Code, Division 20, Chapter 6.95 applies to the preparation of hazardous materials release response plans and inventories.

California Code of Regulations CCR, Worker Safety Standards, Title 8, Section 5192

OSHA requires employers to provide the following training to employees who are designated to respond to a hazardous materials spill. Employees may NOT respond to spills if they have not been certified to do so. The following courses include student materials and certification.

- Hazardous Materials Awareness Level Training (8 hours)

  First Responders at the Awareness Level are individuals who are likely to witness or discover a hazardous substance release and who have been trained to initiate an emergency response sequence by notifying the proper authorities of the release. They would take no further action beyond notifying the authorities of the release. This course meets requirements of 29 CFR 1910.120 and Title 8 Section 5192.

- Hazardous Materials Operations Level Training (24 hours)

  First Responders at the Operations Level are individuals who respond to releases or potential releases of hazardous substances as part of the initial response to the site for the purpose of protecting nearby persons, property, or the environment from the effects of the release. They are trained to respond in a defensive fashion without actually trying to stop the release. Their function is to contain the release from a safe distance, keep it from spreading, and prevent exposures. This course meets requirements of 29 CFR 1910.120 and Title 8 Section 5192.

- Hazardous Materials Technician Level Training (32 hours)

  Hazardous materials technicians are individuals who respond to releases or potential releases for the purpose of stopping the release. They assume a more aggressive role than a First Responder at the Operations Level in that they will approach the point of release in order to plug, patch or otherwise stop the release of a hazardous substance. Also, technicians will decontaminate the release area and properly prepare materials for proper disposal. This course meets requirements of 29 CFR 1910.120 and Title 8 Section 5192.

- Hazardous Material Incident Commander (additional 8 hours beyond technician level)

  This course is designed to provide participants with an increased capability to assume the role of an incident commander during hazardous materials events; with specific emphasis on personnel safety and management of the hazardous-material scene. This course is targeted and helpful for anyone who may assume an incident command system commander general staff role on a hazardous-material incident. This is an excellent scene management class for any multi-agency emergency. Any public or private agency which has "scene management responsibility must have this level or training under federal/state OSHA regulations. This course meets requirements of Title 8 Section 5192. Must also complete the 32-hour technician course for this certification.

SB 1889, Accidental Release Prevention Law

Environmental Protection: Actions against a Public Agency. In October 1996, California passed Senate Bill 1889, now incorporated as Health and Safety Code Sections 25531 to 25534.3. This bill

established the merging of the federal and State programs for the prevention of accidental releases of regulated toxic and flammable substances. Cal OES has adopted regulations to eliminate the need for two separate and distinct risk management programs. The incorporation of the federal and State requirements has been designated as the California Accidental Release Prevention Program.

3.9.3.3 Local Regulations

Santa Clara County Hazardous Materials Compliance Division

The Hazardous Materials Compliance Division (HMCD), established in 1983 with adoption of the local Hazardous Materials Storage Ordinance (HMSO), regulates the storage of hazardous materials above and below ground. This ordinance, the first of its kind in the state, has several key provisions that, when implemented by businesses, provide protection for public health and the environment.

In addition to the HMSO, HMCD enforces the County's Toxic Gas Ordinance and Non-Point Source (Urban Runoff) Ordinance.

Passage of Senate Bill 1082 in 1993 required consolidation of state-mandated hazardous waste and hazardous materials management programs within a single Unified Program, to be administered by a Certified Unified Program Agency (CUPA). These programs are:

1. Hazardous Waste Generator Program
2. Tiered Permitting Program
3. Hazardous Materials Business Plan
4. Aboveground Storage Tank Program
5. Underground Storage Tank Program
6. California Accidental Release Program

HMCD has been certified by the state to be the CUPA to administer these six programs throughout Santa Clara County, except in the cities of Santa Clara, Gilroy, and Sunnyvale, which are themselves CUPAs. It is their responsibility to consolidate administration of the six programs by consolidating permits and billing of permit fees, and developing a single inspection and enforcement program. HMCD works closely with the city jurisdictions that serve as Participating Agencies within the County Unified Program to develop and implement all required Unified Program elements.

Santa Clara County Department of Environmental Health

The Department of Environmental Health (DEH) enhances the quality of life for those who live and work in Santa Clara County by protecting public health, protecting the environment, educating the public, and implementing and enforcing local, state, and federal environmental laws. DEH includes Consumer Protection, Solid Waste, and Hazardous Materials Divisions. DEH regulates retail food safety, swimming pools, small drinking water systems, on-site wastewater systems, above and underground storage tanks and cleanup, and medical and hazardous materials and waste. Also, DEH serves as the Solid Waste Local Enforcement Agency.

Santa Clara County Moffett Federal Airfield Comprehensive Land Use Plan

The Airport Land Use Commission was established to provide for appropriate development of areas surrounding public airports in Santa Clara County. It is intended to minimize the public's exposure to excessive noise and safety hazards, and to ensure that the approaches to airports are kept clear of structures that could pose an aviation safety hazard.

Due to the Project Site's proximity to Moffett Federal Airfield, the Project Site is within the area covered by the Santa Clara County Moffett Federal Airfield Comprehensive Land Use Plan (Moffett CLUP), adopted in 2012 by the Santa Clara County Airport Land Use Commission. The Moffett CLUP is intended to safeguard the general welfare of inhabitants within the vicinity of Moffett Federal Airfield and aircraft occupants. Although NASA has not elected to apply the Moffett CLUP to NASA ARC, compatibility criteria contained within the Moffett CLUP are applicable to development within the Project Site. The Moffett CLUP is also intended to ensure that surrounding new land uses will not affect Moffett Federal Airfield's continued operation. The Moffett CLUP provides a guide to NASA management, as custodian, for decisions that affect the future of Moffett Federal Airfield and provides a basis for additional assessments, if required. The Project Site is not within an Airport Safety Zone, as defined in the Moffett CLUP.

Santa Clara County Operational Area Hazard Mitigation Plan

Hazard mitigation is any sustainable action that reduces or eliminates long-term risk to people and property from future disasters. Mitigation planning breaks the cycle of disaster damage, reconstruction, and repeated damage. Hazard mitigation includes long-term solutions that reduce the impact of disasters in the future. The Santa Clara County Hazard Mitigation Program has four goals:

1. Reduce the vulnerability of communities to disasters and their effects
2. Promote individual and community safety and their ability to adapt to changing conditions to withstand and rapidly recover from disruptions due to emergencies
3. Promote community vitality after a disaster
4. Lesson response and recovery resource requirements after a disaster

The mitigation program uses a three-pronged approach to engage County departments and jurisdictions within the Operational Area and accomplish the mitigation program goals.

3.9.4 CEQA Findings

The following sections describe the environmental impacts of the proposed project associated with hazardous materials in accordance with CEQA. The sections describe the thresholds used to determine whether an impact would be significant and methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts on hazardous materials is discussed separately in Section 4.5.8, *Hazards and Hazardous Materials*, in Chapter 4, *Environmental Impact Statement*.

3.9.5 Thresholds of Significance

In accordance with Appendix G of the CEQA Guidelines, the project would have the potential to have a significant effect on hazards and hazardous materials if it would result in any of the conditions listed below:

Would the project:

- Create a significant hazard to the public of the environment through the routine transport, use, or disposal of hazardous materials?
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?
- For a project within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard for people living or working in the project area would the project result in a safety hazard or excessive noise for people residing or working in the project area?
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?
- Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to hazards and hazardous materials?

3.9.6 Methods for Analysis

As described in Section 3.9.3, *Plans, Policies, and Regulations*, the use of hazardous materials is subject to numerous laws and regulations. In most cases, the laws and regulations pertaining to hazardous materials management minimize risks to human health and the environment. The impact analysis identifies areas where impacts related to the use of hazardous materials during project construction and operation would be subject to applicable laws and regulations. To assess the proposed project's potential to create a significant hazard for the public or environment related to hazardous materials, the impact analysis considers the potential pathways through which exposure to hazards could occur.

3.9.7 Impacts Not Evaluated in Detail

Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

There are currently no K–12 schools at NASA ARC; there are no schools within 0.25 mile of the Project Site. The closest schools are the Bay Area Arabic School at 310 Easy Street in the city of Mountain View and the Yew Chung International School of Silicon Valley at the same address; these schools are approximately 0.8 mile from the Project Site. Therefore, the proposed project would not emit hazardous emissions or handle hazardous or acutely hazardous materials within 0.25 mile of an existing or proposed school, resulting in no impact. This topic is not evaluated further.

Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

The California Department of Forestry and Fire Protection (CAL FIRE) has mapped Very High Fire Hazard Severity Zones in Santa Clara County to help responsible local agencies identify measures to reduce the potential for loss of life, property, and resources from wildland fire. The Project Site is located on federal land within NASA ARC; thus, the Project Site is designated as a Federal Responsible Area and contains no State Responsibility Areas. In addition, according to CAL FIRE mapping, no land adjacent to the Project Site is designated as a Very High Fire Hazard Severity Zone.[28] The closest Fire Hazard Severity Zone to the Project Site is located approximately 5.4 miles to the southwest, near the western portion of Cupertino.[29] Therefore, the CEQA Proposed Project and the CEQA Reduced Density Alternative would not be located within or near a wildland area and would not be subject to significant risk involving wildland fires. Therefore, the proposed project would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires, resulting in no impact. This topic is not evaluated further.

3.9.8 Impacts and Mitigation Measures

Impact CEQA-HAZ-1: Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	HAZ-1. Implement the Environmental Issues Management Plan	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

Project construction under the CEQA Proposed Project would involve routine transport, use, and disposal of hazardous materials such as solvents, paints, oils, grease, and caulking. Such transport, use, and disposal must comply with applicable regulations discussed under Section 3.9.3, *Plans, Policies, and Regulations* such as RCRA hazardous materials "cradle to grave" regulations (40 CFR), OSHA hazardous materials handling and training regulations, DOT regulations (49 CFR 100–185), etc. Although solvents, paints, oils, grease, and caulking would be transported, used, and disposed of during the construction phase, these materials are handled on a temporary basis and are typically used in construction projects and thus, would not represent the routine transport, use, and disposal of acutely hazardous materials. Any spills or releases involving these materials are expected to be small, localized, and cleaned as they occur. In addition, a Stormwater Pollution Prevention Plan (SWPPP) would be prepared and implemented during project construction for coverage under the required Construction General Permit,[30] in accordance with the requirements of the SWRCB. A SWPPP requires implementation of best management practices for hazardous materials storage and soil stockpiles, inspections, maintenance, employee training, and the containment of releases to prevent runoff to stormwater collection systems or waterways.

The proposed project would demolish all existing buildings, building slabs, pavement sections, utility infrastructure, sidewalks, and other hardscape within the Limits of Work. As discussed under Section 3.9.2, *Affected Environment/Environmental Setting*, structures within the Project Site may contain hazardous building materials such as asbestos-containing material (ACM) and lead-based paint (LBP), and polychlorinated biphenyl (PCBs). As such, demolition of existing structures may expose

[30] State Water Resources Control Board. 2025. *Welcome to the Construction Stormwater Program*. Available: https://www.waterboards.ca.gov/water_issues/programs/stormwater/construction.html. Accessed: September 16, 2025.

construction workers, the public, or the environment to hazardous building materials. The level of potential impact depends on the age, construction, and building materials of each building. Any activity that involves cutting, grinding, or drilling during building renovation or demolition, or relocation of underground utilities, could release friable asbestos fibers or lead dust, unless proper precautions are taken. Potential exposure to hazardous building materials would be reduced through appropriate identification, removal, and disposal according to applicable regulations, as described in the NASA ARC *Asbestos Management Plan* (part of the NASA ARC Health and Safety Manual).

According to the Spring 2026 project-specific EIMP, many of the existing buildings within Project Site are known to contain ACM as a result of base-wide asbestos surveys conducted in 1993 and 2001, and sampling of several individual buildings that was conducted as a result of historical building modifications. In addition to the buildings with confirmed or suspect ACM present, other buildings are assumed to likely contain ACM due to their age. Lead-based paint has been used in existing buildings and residues from lead-based paint occur in surface soil adjacent to buildings where lead-based paint has been used. Moreover, PCBs are known to be present in paint and building materials from buildings constructed between 1950 and 1979 and thus, PCBs are likely to be present on-site. Accordingly, the CEQA Proposed Project could create a hazard for the public or the environment through the routine transport, use, or disposal of hazardous materials during construction, and this impact would be potentially significant before mitigation.

Operations

Under the CEQA Proposed Project, the proposed project would be developed with research and office uses (consisting of offices, laboratories, R&D, and related amenities), conference center uses, active uses, student/faculty housing, and short-term lodging. Due to the nature of R&D uses, the possibility exists for hazards related to the handling of hazardous materials and waste to occur. Laboratories constructed and operated as part of the CEQA Proposed Project and CEQA Reduced Density Alternative will comply with required federal, State, and local standards, in accordance with Ames Policy Directive (APD) 8829.1.[31] A small portion of the proposed laboratories associated with the Research and Office Uses would be categorized by biosafety levels (BSLs). Only BSL-1, BSL-2, and BSL-3 laboratories are included in the scope of the CEQA Proposed Project and CEQA Reduced Density Alternative; the proposed project would not include BSL-4 laboratories.[32] Because of the nature of laboratory uses, the possibility exists for hazards related to the handling of hazardous materials (e.g., chemicals and chemical mixtures).

[31] APD 8829.1 establishes the construction permit process and requirements for all construction activities at NASA ARC. The required standards include 29 Code of Federal Regulations (CFR) 1926, Safety and Health Regulations for Construction, and 29 CFR 1910, Occupational Safety and Health Standards, as well as the current adopted California Fire Code and California Building Code requirements addressing the prevention and control of dangerous conditions related to the storage, use, and handling of hazardous materials (California Code of Regulations [CCR] Title 24, Part 9).

[32] BSL-1 laboratories are used to study infectious agents or toxins not known to consistently cause disease in healthy adults. BSL-2 laboratories are used to study moderate-risk infectious agents or toxins that pose a risk if accidentally inhaled, swallowed, or exposed to the skin. BSL-3 laboratories are used to study infectious agents or toxins that may be transmitted through the air and cause potentially lethal infection through inhalation exposure. BSL-3 and BSL-4 laboratories are intended for the storage and study of acutely hazardous biomaterials (e.g., viruses, pathogens, microbes). More information about BSLs is available at https://www.cdc.gov/training/quicklearns/biosafety/#:~:text=The%20biosafety%20levels%20range%20from,level%20on%20the%20following%20screens.

In accordance with standard industry practices, the CEQA Proposed Project and any future tenant that handles qualifying hazardous materials, would be required to meet relevant Biosafety in Microbiological and Biomedical Laboratories (BMBL) and National Institute of Health (NIH) guidelines. In addition, any future tenant that handles qualifying hazardous materials would be required to adhere to all applicable federal, state and local regulations for qualifying hazardous materials, seek consultation with the County of Santa Clara, Department of Environmental Health[33][34] (DEH), and apply for applicable permits for any regulated substance that may pose a threat to public health and safety or the environment because they are highly toxic, flammable, or explosive. Tenants must comply with the safety procedures mandated by applicable federal, state, and local laws and regulations (e.g., RCRA, California Hazardous Waste Control Law, Title 8 of the California Code of Regulations) to ensure that risks resulting from the routine use of hazardous materials and disposal of hazardous wastes remain less than significant. R&D laboratories would also meet relevant Biosafety in Microbiological and Biomedical Laboratories (BMBL) and National Institute of Health (NIH) guidelines applicable to BSL laboratories, ensuring safe operating conditions and minimizing any risk of upset. In addition, registration of hazardous materials through the SMCEHD Hazardous Material Business Plan Program[35] (under CA Health and Safety Code, Division 20, Chapter 6.95) would be required to ensure safe and responsible handling of those qualifying materials. Adherence to the Santa Clara County Hazardous Materials Storage Ordinance, Division B11-270 to 351would ensure proper storage of these materials. Moreover, compliance with the California Fire Code (CCR Title 24 Part 9) and National Fire Protection Association requirements would ensure that buildings are equipped with safety measures to minimize potential impacts of the presence of hazardous materials.

Conference Center uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging uses included in CEQA Proposed Project would involve the use of hazardous chemicals that are typical in retail, meeting space, and office settings (e.g., toners, paints, kitchen and restroom cleaners, other maintenance materials). Landscape maintenance on the Project Site would require the use of a wide variety of commercial products that are formulated with hazardous materials (e.g., fuels, cleaners and degreasers, solvents, paints, lubricants, adhesives, sealers, and pesticides/herbicides). Such materials are considered common and are unlikely to be stored or used in large quantities. Any spills involving these materials would be small and localized and would be cleaned up as they occur.

Finally, compliance with the California Department of Transportation (Caltrans) regulations would ensure that all necessary safety precautions would be taken during transport of hazardous materials during all phases of the project. Therefore, mandatory compliance with all applicable federal, state, and local regulations pertaining to the safe use, storage, transport and disposal of hazardous materials would ensure that the proposed project would not create a significant hazard for the public or the environment through the routine transport, use, or disposal of hazardous materials during operation, and this impact would be less than significant.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

The Project Proponent and/or its contractor(s) shall implement the Spring 2026 project-specific Environmental Issues Management Plan (EIMP) prepared for the proposed project and approved by the EPA and Regional Water Board to (1) comply with land use restrictions and institutional controls (LUCs and (2) take reasonable steps with respect to environmental conditions within the Project Site to ensure that occupancy and development activities within the Project Site proceed in a manner that is protective of human health and the environment and is coordinated with the ongoing response actions being undertaken by the Responsible Parties. The project-specific EIMP shall include, but not be limited to, the following:

- A summary of environmental conditions;
- A summary of potential exposure pathways from COPCs in groundwater, soil vapor, and soil;
- Target cleanup levels;
- A baseline of minimum design considerations for new construction for vapor intrusion mitigation and utility construction;
- Risk management measures to be implemented during construction;
- Post-construction risk management procedures for future subsurface activities; and
- Procedures for long-term compliance with the project-specific EIMP, CERCLA (including vapor intrusion monitoring and associated operation and management of all engineering controls installed), and other environmental requirements.[36]
- The Project Information and Summary of Environmental Conditions (PISEC) for each area shall be approved by the appropriate regulatory agencies (EPA and the Regional Water Board) prior to the start of construction activities.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires a pre-demolition survey along with a building evaluation for PCBs and other chemicals to identify the presence of hazardous building materials in buildings to be demolished. In addition, the Spring 2026 project-specific EIMP provides protocols for proper handling and disposal of these materials. Based on the above, impacts related to creating a hazard for the public or the environment through the routine transport, use, or disposal of hazardous materials during construction would be less than significant with mitigation.

[36] The Master Lessee and NASA will maintain documentation of notification of the known environmental conditions within the Project Site and of the requirements of the Spring 2026 project-specific EIMP to the property manager, and tenants and other entities leasing or otherwise exercising control over space within the Project Site. Property managers, tenants, or others exercising control over space within the Project Site will inform their construction contractors and maintenance workers about the Spring 2026 project-specific EIMP, as needed, to ensure compliance.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. Because the Variant would have the same type of land uses, would disturb the same footprint, and would conduct the same construction activities proposed and evaluated under the CEQA Proposed, the analysis of the CEQA Proposed Project would apply here. Because the Variant proposes more Research and Office Uses, it is possible that the quantity of hazardous materials used and hazardous waste produced would be greater under the Variant; however, the potential types of impacts (associated with handling of hazardous materials) would be the same as those analyzed under the CEQA Proposed Project and impacts would be potentially significant before mitigation before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires a pre-demolition survey along with a building evaluation for PCBs and other chemicals to identify the presence of hazardous building materials in buildings to be demolished. In addition, the Spring 2026 project-specific EIMP provides protocols for proper handling and disposal of these materials. Based on the above, impacts related to creating a hazard for the public or the environment through the routine transport, use, or disposal of hazardous materials during construction would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristics of the CEQA Proposed Project. The CEQA Reduced Density Alternative would be conducted in the same Limits of Work and would include the same land uses (albeit less space for Research and Office Uses) and as such, the analysis of the CEQA Proposed Project would apply here. Since the CEQA Reduced Density Alternative proposes less Research and Office Uses, it is possible that the quantity of hazardous materials used and hazardous waste produced would be less under this alternative; however, the potential types of impacts (associated with handling of hazardous materials) would be the same as those analyzed under the CEQA Proposed Project and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires a pre-demolition survey along with a building evaluation for PCBs and other chemicals to identify the presence of hazardous building materials in buildings to be demolished. In addition, the Spring 2026 project-specific EIMP provides protocols for proper handling and disposal of these materials. Based on the above, impacts related to creating a hazard for the public or the environment through the routine transport, use, or disposal of hazardous materials during construction would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Reduced Density Alternative. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative. Because the Variant would have the same type of land uses, the same general site plan, and the same construction activities proposed and evaluated under the CEQA Reduced Density Alternative, the analysis of the CEQA Reduced Density Alternative would apply here. Because the Variant proposes more Research and Office Uses, it is possible that the quantity of hazardous materials used and hazardous waste produced would be greater under the Variant; however, the potential types of impacts (associated with handling of hazardous materials) would be the same as those analyzed under the CEQA Reduced Density Alternative and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires a pre-demolition survey along with a building evaluation for PCBs and other chemicals to identify the presence of hazardous building materials in buildings to be

demolished. In addition, the Spring 2026 project-specific EIMP provides protocols for proper handling and disposal of these materials. Based on the above, impacts related to creating a hazard for the public or the environment through the routine transport, use, or disposal of hazardous materials during construction would be less than significant with mitigation.

Impact CEQA-HAZ-2: Would the project create a significant hazard to the public or environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	HAZ-1. Implement the Environmental Issues Management Plan	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

The Project Site is located within the footprints of both the MEW Superfund Site and former Naval Air Station Moffett Field Superfund site. As discussed in Section 3.9.2, *Affected Environment/ Environmental Setting*, on-site soil and groundwater have been affected historically by contamination associated with both the MEW Superfund Site and the U.S. Navy's operations at Naval Air Station Moffett Field. To fully characterize and address on-site conditions, multiple site-specific investigations along with associated remediation activities have been conducted within the vicinity of the Project Site.

The technical reports described in Section 3.9.2, *Affected Environment/ Environmental Setting,* include the most recent environmental management plans and remediation progress reports and are used in support of the conclusions. In particular, the Spring 2026 project-specific EIMP considers (relevant) previous investigations conducted on-site and summarized the current environmental conditions on the Project Site. In addition, the Spring 2026 project-specific EIMP includes required procedures to address the known remaining environmental conditions within the Project Site, along with contingencies to be taken in the event that previously unknown environmental conditions are encountered during development. As a result of the historical information analyzed (additional details found under Section 3.9.2, *Affected Environment/ Environmental Setting*), the Spring 2026 project-specific EIMP concludes that the following environmental conditions must be considered during project implementation:

- The presence of chlorinated VOCs in groundwater, soil gas and soil within the site, predominantly resulting from the migration of contaminated groundwater from the upgradient MEW Superfund Site as well as NASA sources within NASA ARC. The Spring 2026 project-specific

EIMP identifies chlorinated VOCs as the primary chemical of potential concern (COPC), including trichloroethene (TCE) and cis 1,2 dichloroethene.

- Fuel oil and solvent tanks associated with a former dry-cleaning facility that operated in the 1990s. Tank 68 (and its associated Sump 91) have not received regulatory closure and are considered to be part of IR Site 14, an active Navy remediation site. Impacted media is listed as soil and COPCs include VOCs (undisclosed). According to the Spring 2026 project-specific EIMP, Tank 68 was a 2,000-gallon UST (used to store waste solvents) that was initially closed in place and later removed during remediation of Building 88 in the mid-1990s.
- The presence of total petroleum hydrocarbons (TPH) and other fuel-related constituents, including BTEX compounds, in on-site groundwater and soil. This is associated with previously decommissioned USTs, sumps, hydraulic lifts, a hydraulic oil reservoir tank, a waste oil line, and a subgrade clarifier.
- The presence of per- and polyfluoroalkyl substances (PFAS) compounds in on-site groundwater resulting from various historical site uses.
- The potential for elevated concentrations of polychlorinated biphenyls (PCBs) in soil surrounding buildings or transformers.
- The potential for elevated concentrations of lead in soil surrounding buildings.
- Existing subsurface structures (e.g., sumps or tanks) that may require removal.
- Hazardous building materials containing asbestos-containing materials, lead-based paint, along with PCB containing equipment in existing buildings.
- Protection of existing remediation infrastructure, including networks of groundwater monitoring wells and groundwater extraction and conveyance piping.

Primary potential future receptors and potential pathways of exposure are identified in the Spring 2026 project-specific EIMP and summarized in Section 3.9.2.3, *Spring 2026 Project-Specific Environmental Issues Management Plan*. Also, vapor intrusion was noted as the primary potentially complete exposure pathway that could affect future indoor residents and workers within all portions of the Project Site.

Affected Soil and Groundwater

Contaminated on-site soil or groundwater exists within the Project Site. Depending on the contaminant characteristics and extent of contamination in particular locations, ground disturbance and excavation activities conducted during construction are likely to encounter contaminated soil. In addition, dewatering within the Project Site could result in the withdrawal of contaminated groundwater. If groundwater contains contaminants above regulatory levels, a release could present a hazard to people or the environment unless it is effectively managed. Encountering contaminated soil or groundwater would create an exposure risk to construction personnel and the surrounding environment. Accordingly, impacts related to affected soil and groundwater would be potentially significant before mitigation.

Subsurface Infrastructure

As described in the Spring 2026 project-specific EIMP, numerous USTs and sumps were known to exist within the Project Site. However, all known USTs and sumps within the Project Site have been removed as well as confirmed and assigned *no further action* status by the Regional Water Board. IR

Site 15[37] within Parcels 5A/5B includes sumps located around the former Moffett Federal Airfield, two of which are located within or adjacent to the Project Site. According to the Spring 2026 project-specific EIMP, if residential use is planned within the IR Site 15 boundary, the Master Lessee will work with the Regional Water Board to evaluate if additional investigation and/or remediation is needed.

An unknown UST or sump, or other undocumented subsurface feature (such as buried drums and containers and abandoned pipes) could be discovered during construction activities. Accordingly, impacts related to subsurface infrastructure would be potentially significant before mitigation.

Hazardous Building Materials

As mentioned previously, many of the buildings within the Project Site contain hazardous materials, such as ACM and LBP, and electrical equipment containing PCBs. Accordingly, impacts related to hazardous building materials would be potentially significant before mitigation.

Active Remediation Infrastructure

The MEW Companies have constructed and are currently operating groundwater extraction wells and associated conveyance piping and monitoring wells within the Project Site. In addition, the Navy has constructed remediation infrastructure on-site, including the installation of groundwater monitoring wells. This infrastructure could be damaged during construction of the CEQA Proposed Project. In addition to requiring potentially costly repairs, the contaminants within the system(s) could be re-released into the environment (in the same location or in other locations of the Project Site). Accordingly, impacts related to active remediation infrastructure would be potentially significant before mitigation.

Vapor Intrusion

The Project Site is almost entirely within the MEW Vapor Intrusion (VI) Study Area (of the VI Pathway) for the MEW Superfund Site. Thus, implementation of the project in the area proposed could result in vapor intrusion exposure risks. Accordingly, the CEQA Proposed Project could have a significant impact related to vapor intrusion. Refer to Impact CEQA-HAZ-1 regarding the potential risk of upset of hazardous materials associated with the operation of R&D laboratories on-site.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1: Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

The Spring 2026 project-specific EIMP provides the minimum design considerations for new construction, risk management measures that must be implemented during construction within the Limits of Work, postconstruction risk management procedures for future subsurface activities within the Limits of Work, as well as procedures for long-term compliance with the Spring 2026

[37] Parcels 5A and 5B within the Project Site contain three CERCLA-related sites (IR Site 14-North, IR Site 15, and IR Site 18) and are adjacent to and affected by an additional CERCLA site (IR Site 28). The Spring 2026 project-specific EIMP contains additional information related to these sites.

project-specific EIMP and other environmental regulatory requirements. The Spring 2026 project-specific EIMP is currently under review by the EPA and Regional Water Board, the regulatory agencies that will approve of the EIMP. Prior to commencement of construction of the proposed project, the EPA and the Regional Water Board will review and approve the Spring 2026 project-specific EIMP. Compliance with the Spring 2026 project-specific EIMP will be monitored by those same expert agencies.

With respect to affected soil and groundwater, the Project Proponent would be required to implement recommendations found in the Spring 2026 project-specific EIMP related to the handling of affected media. These measures would minimize the potential exposure of construction personnel to contaminated media and would mitigate risks to human health and the environment from exposure to COPCs on the Project Site. Applicable measures include but are not limited to health and safety requirements for workers, dust and particulate control, decontamination, storm water pollution control, soil management protocols and dewatering protocols. With respect to subsurface infrastructure, management and disposal measures would be implemented to reduce potential exposure risks to construction personnel and the surrounding environment should they contain hazardous materials or affected media. With respect to hazardous building materials, the proposed project would adhere to the NASA ARC *Asbestos Management Plan* (part of the NASA ARC Health and Safety Manual) requiring a pre-demolition survey for the presence of ACM, and the removal and management of ACM in accordance with all applicable government regulations and with oversight by the NASA ARC Safety, Health & Medical Services Office. In addition, the Project Proponent would conduct a pre-demolition survey (and a building evaluation for PCBs and other chemicals) to identify the presence of hazardous building materials. Management and disposal of these materials would be conducted in a manner consistent with state laws and applicable requirements. With respect to active remediation infrastructure, the Project Proponent would be required to coordinate with the Responsible Party for the protection of the said infrastructure. In addition, the Project Proponent would implement measures during construction to further protect the integrity of the remediation infrastructure on-site, the MEW Companies groundwater remediation system, and the MEW, Navy, and NASA monitoring wells during development. With respect to vapor intrusion, design-specific measures include the implementation of engineering controls, the design of VI mitigation, and monitoring of VI mitigation effectiveness. Post construction mitigation includes long term monitoring and verification of vapor intrusion mitigation adequacy.

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. Based on the above, impacts related to creating a hazard to the public or the environment through reasonably forseeable upset and accident conditions involving the release of hazardous materials would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA

Proposed Project. Because the Variant would have the same type of land uses, would disturb the same footprint, and would conduct the same construction activities proposed and evaluated under the CEQA Proposed Project, the analysis of the CEQA Proposed Project would apply here. The potential types of impacts under the Variant would be the same as those analyzed under the CEQA Proposed Project and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. Based on the above, impacts related to creating a hazard to the public or the environment through reasonably forseeable upset and accident conditions involving the release of hazardous materials would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristics of the CEQA Proposed Project. The CEQA Reduced Density Alternative would be conducted in the same Limits of Work and would include the same land uses (albeit less space for Research and Office Uses) and as such, the analysis of the CEQA Proposed Project would apply here. The potential types of impacts would be the same as those analyzed under the CEQA Proposed Project and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. Based on the above, impacts related to creating a hazard to the public or the environment through reasonably forseeable upset and accident conditions involving the release of hazardous materials would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Reduced Density Alternative. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of

Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative. Because the Variant would have the same type of land uses, would occur in the same footprint, and would include the same construction activities proposed and evaluated under the CEQA Reduced Density Alternative, the analysis of the CEQA Reduced Density Alternative would apply here. The potential types of impacts under the Variant would be the same as those analyzed under the CEQA Reduced Density Alternative and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. Based on the above, impacts related to creating a hazard to the public or the environment through reasonably forseeable upset and accident conditions involving the release of hazardous materials would be less than significant with mitigation.

Impact CEQA-HAZ-3: Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and, as a result, would it create a significant hazard to the public or the environment?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	HAZ-1. Implement the Environmental Issues Management Plan	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

As stated in Section 3.9.2 *Affected Environment/Environmental Setting,* on-site soil and groundwater have been affected by contamination associated with the MEW Superfund Site and the U.S. Navy's operations at Naval Air Station Moffett Field. Also, the Project Site is located within the footprints of both the MEW Superfund Site and the former Naval Air Station Moffett Field Superfund site. In addition, numerous other potential sources of contamination (associated with underground storage tanks and sumps containing petroleum hydrocarbons) have been investigated and remediated within the Project Site, according to the Spring 2026 project-specific EIMP. Thus, the Project Site has a long history of environmental releases, investigations and remediation activities, which have resulted in multiple environmental listings including those meeting the requirements of a Cortese List site. As a result of the environmental history available for the site (and historical contamination associated with on-site features), the Spring 2026 project-specific EIMP concludes that several environmental conditions are to be considered during project implementation. Potential impacts to the project as a result of historical contamination (associated with affected sites within and near the Project Site) are analyzed under Impact CEQA-HAZ-2, and thus, the analysis identified under Impact CEQA-HAZ-2 would also apply to potential impacts associated with being exposed to contaminated media as a result of project implementation within a Cortese List site. Accordingly, impacts associated with being exposed to contaminated media as a result of project implementation within a Cortese List site would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires that protocols be implemented that would address potential short-term and long-term exposure to affected soil, soil vapor (in the form of vapor intrusion), and groundwater as a result of project implementation on a contaminated site. Based on the above, impacts associated with being exposed to contaminated media as a result of project implementation within a Cortese List site would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. Because the Variant would have the same type of land uses, would disturb the same footprint, and

would conduct the same construction activities proposed and evaluated under the CEQA Proposed Project, the analysis of the CEQA Proposed Project would apply here. The potential types of impacts under the Variant would be the same as those analyzed under the CEQA Proposed Project and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires that protocols be implemented that would address potential short-term and long-term exposure to affected soil, soil vapor (in the form of vapor intrusion), and groundwater as a result of project implementation on a contaminated site. Based on the above, impacts associated with being exposed to contaminated media as a result of project implementation within a Cortese List site would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristics of the CEQA Proposed Project. The CEQA Reduced Density Alternative would be conducted in the same Limits of Work and would include the same land uses (albeit less space for Research and Office Uses) and as such, the analysis of the CEQA Proposed Project would apply here. The potential types of impacts would be the same as those analyzed under the CEQA Proposed Project and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires that protocols be implemented that would address potential short-term and long-term exposure to affected soil, soil vapor (in the form of vapor intrusion), and groundwater as a result of project implementation on a contaminated site. Based on the above, impacts associated with being exposed to contaminated media as a result of project implementation within a Cortese List site would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Reduced Density Alternative. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative. Because the Variant would have the same type of land uses, the same general site plan, and the same construction activities proposed and evaluated under the CEQA Reduced Density Alternative, the analysis of the CEQA Reduced Density Alternative would apply here. The potential types of impacts under the Variant would be the same as those analyzed under the CEQA Reduced Density Alternative and impacts would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1.

Significance after Mitigation

With implementation of Mitigation Measure HAZ-1, which requires compliance with the Spring 2026 project-specific EIMP, human health and the environment would be protected. The Spring 2026 project-specific EIMP requires that protocols be implemented that would address potential short-term and long-term exposure to affected soil, soil vapor (in the form of vapor intrusion), and groundwater as a result of project implementation on a contaminated site. Based on the above, impacts associated with being exposed to contaminated media as a result of project implementation within a Cortese List site would be less than significant with mitigation.

Impact CEQA-HAZ-4: For a project within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people living or working in the project area?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

Due to the Project Site's proximity to Moffett Federal Airfield, the Project Site is within an FAA notification area and height restriction area with a contour range of 157 feet above mean sea level based in National Geodetic Vertical Datum (NGVD) of 1988 to 182 feet above mean sea level based in NVGD of 1988, per Federal Aviation Regulation Part 77, Surfaces Map, for Moffett Federal Airfield.[38] Federal Aviation Regulation Part 77, Safe, Efficient Use, and Preservation of the Navigable Airspace, establishes imaginary surfaces for airports and runways as a means of identifying areas of airspace wherein objects would be obstructions to air navigation.

Development within the Project Site would be subject to certain height limitations pursuant to Federal Aviation Regulation Part 77.9 of the CFR notification requirements, which would require consultation with the FAA prior to construction of any structure or object within Federal Aviation Regulation Part 77 surfaces. Compatibility with Federal Aviation Regulation Part 77 would be contingent on issuance of a Determination of No Hazard from the FAA for any proposed structures. The proposed building heights under the CEQA Proposed Project would comply with FAA requirements. However, the use of construction equipment (such as cranes) or the construction of buildings with heights in excess of 55 feet above ground level could pose a safety hazard for construction workers and future residents. With the issuance of a Determination of No Hazard from the FAA, project construction and operation would comply with Moffett Federal Airfield's CLUP safety guidelines and would not pose a risk to aviation safety. In addition, and as discussed in Section 3.12, *Noise*, of this joint EIR/EIS, impacts related to aircraft noise would be considered less than significant.

As discussed in Section 2.3.2.6, *Open Space and Landscaping*, in Chapter 2, *Project Description*, of this joint EIR/EIS, the Project Site currently has approximately 245 trees. In total, implementation of the CEQA Proposed Project would include removing approximately 227 trees and planting approximately 1,283 new trees, resulting in a total of approximately 1,301 trees on the Project Site. The increased landscaping could potentially attract more birds to the Project Site, which could in turn increase the potential for aircraft-involved bird strike due to the Project Site's proximity to Moffett Federal Airfield. However, the Project Site and surrounding area are developed. Given that the area surrounding the Project Site is developed, large numbers of birds are not expected to be flying over the Project Site for substantial bird-strikes to occur. While more birds may be present at the Project Site compared to existing conditions, given the urbanized nature of the area, the introduction of more trees is unlikely to substantially change the existing bird population dynamics and flight patterns.

[38] Santa Clara County Airport Land Use Commission. 2012. Santa Clara County Moffett Federal Airfield Comprehensive Land Use Plan. Figure 6: Moffett Federal Airfield FAR Part 77 Surfaces. Adopted November 2, 2012; amended December 19, 2018.

Moffett CLUP Policy G-6 states that proposed uses that may cause a hazard to aircraft in flight are not permitted within the airport influence area (AIA) and includes uses that attract birds (such as certain agricultural uses, sanitary landfills). The CEQA Proposed Project does not propose these or any other type of use that would be expected to attract large flocks of birds. Moreover, the project would adhere to the Advisory Circular on Airport Construction Standards AC 150/5370-10, which include seeding guidelines (901-2.1) which require that consideration be given to eliminate the use of seeds that could attract birds or large animals. Therefore, the CEQA Proposed Project would be consistent with applicable safety- and noise-related policies under the Moffett Federal Airfield. As such, the project would not pose a safety hazard or generate excessive noise for people working in the project area. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project. Because the Variant would have the same type of land uses, would disturb the same Limits of Work, and would conduct the same construction activities proposed and evaluated under the CEQA Proposed Project, the analysis of the CEQA Proposed Project would apply. The potential types of impacts under the Variant would be the same as those analyzed under the CEQA Proposed Project. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would not change the basic characteristics of the CEQA Proposed Project. The CEQA Reduced Density Alternative would be conducted in the same Limits of Work, would conduct the same construction activities, and would include the same land uses (albeit less less space for Research and Office Uses). The potential types of impacts under the CEQA Reduced Density Alternative would be the same as those analyzed under the CEQA Proposed Project. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Reduced Density Alternative. Under the Variant, the CEQA Proposed Project or the CEQA Reduced Density Alternative would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative. Because the Variant would have the same type of land uses, would disturb the same Limits of Work, and would conduct the same construction activities proposed and evaluated under the CEQA Reduced Density Alternative, the analysis of the CEQA Reduced Density Alternative would apply. The potential types of impacts under the Variant would be the same as those analyzed under the CEQA Reduced Density Alternative. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

Impact CEQA-HAZ-5: Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

Project development would not include any permanent changes to existing public roadways that provide emergency access to the Project Site or surrounding area. The project consists of redevelopment that includes academic and research facilities; a conference center; retail, food and beverage, collaborative workspaces; student/faculty housing; short-term lodging; transportation networks; and open spaces as well as landscaped spaces. It is possible that construction activity associated with the project could affect emergency response or evacuation plans due to temporary construction barricades or other roadway obstructions that could impede emergency access on-site. However, compliance with Part 6 of the Manual on Uniform

Traffic Control Devices, which outlines guidance and standards for accommodating emergency vehicles in construction areas (as described in Section 3.16, *Transportation and Traffic*) would minimize potential impacts associated with emergency response times and access; therefore, emergency response access or emergency evacuation plan routes would not be impeded significantly during the project's construction period.

As discussed under Impact CEQA-TRAN-4 in Section 3.16, *Transportation and Traffic*, project traffic would not cause a substantial adverse effect on emergency access. The project would not modify public streets outside the Project Site. All public streets outside the Project Site would continue to accommodate emergency vehicles, similar to existing conditions. As required by the California Vehicle Code, non-emergency vehicles would continue to yield the right-of-way to emergency vehicles on both internal NASA ARC and project roadway network and external public streets serving NASA ARC.

Also, the project would not involve any permanent features that would impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan. On the contrary, the project would include multi-modal transportation network and infrastructure improvements that would enhance vehicular access through the Project Site. This would allow for better vehicular circulation and would also improve police, fire, and emergency medical service vehicle access through the Project Site. Therefore, development of the project is not expected to interfere with any Cal OES mandates (under CCR Title 19 Public Safety Division 2) associated with evacuations in the vicinity of the Project Site nor emergency response requirements of the Ames Research Center Emergency Management Plan. Rather, access to the Project Site would be improved by incorporating the internal street improvements.

Furthermore, R&D tenants who handle hazardous materials would be required to adhere to all applicable regulations including the California Hazardous Materials Release Response Plans and Inventory Law (also known as the Hazardous Materials Business Plan program) and the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (the County of Santa Clara's Hazardous Materials Compliance Division under the Department of Environmental Health is the city's Certified Unified Program Agency or CUPA). Adherence to the aforementioned regulations and plans would ensure a proper response and evacuation in the event of an emergency associated with a hazardous material release.

Therefore, the project would not impair implementation of or interfere with an adopted emergency response plan or emergency evacuation plan and this impact would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Proposed Project, including the multi-modal transportation network and infrastructure.

Because the Variant has the same circulation improvements as the CEQA Proposed Project, the potential impacts related to adopted emergency response plans or emergency evacuation plans would not change from those for the CEQA Proposed Project. The impact is considered less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would have the same multi-modal transportation network and infrastructure, the same parking ratios, the same TDM strategies, and a similar mix of uses as under the CEQA Proposed Project. Therefore, the potential impacts to adopted emergency response plans or emergency evacuation plans under the CEQA Reduced Density Alternative would be the same as the CEQA Proposed Project and the impact is considered less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include an additional 130,000 square feet of Research and Office Uses instead of 130,000 square feet of Student/Faculty Housing in Subarea 6. The Variant would not include residential land uses, however, would include 90,000 square feet of laboratory and R&D uses, 25,000 square feet of office uses, and 15,000 square feet of academic uses and otherwise generally include the same type of land uses and site plan as the CEQA Reduced Density Alternative, including the multi-modal transportation network and infrastructure.

Since the Variant has the same circulation improvements as the CEQA Reduced Density Alternative, the potential impacts to adopted emergency response plans or emergency evacuation plans would not change from those for the CEQA Reduced Density Alternative and the impact is considered less than significant.

Mitigation Measures

No mitigation is required for this impact.

3.9.9 Cumulative Impacts

Cumulative impacts are addressed only for those thresholds that would result in a project-related impact. If the proposed project would result in no impact with respect to a particular threshold, it would not contribute to a cumulative impact. As discussed in Section 3.9.7, *Impacts Not Evaluated in Detail*, the proposed project would result in no impact related to emitting hazardous emissions or handle hazardous or acutely hazardous materials within 0.25 mile of an existing or proposed school, and no cumulative analysis is required. In addition, the proposed project would result in no impact related to exposing people or structures to a significant risk of loss, injury, or death involving

wildland fires, and no cumulative analysis is required. The discussion of cumulative impacts addresses the topics evaluated in the corresponding project impacts in Section 3.9.8, *Impacts and Mitigation Measures*, above.

The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Impact Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. The cumulative geographic context for hazards and hazardous materials is site-specific due to the fact that a proposed project's potential impacts are individual and localized, depending on the Project Site, the historic uses, and the different levels of excavation, cut-and-fill work, and grading. However, as presented above, the Project Site is located within a large regional plume of chlorinated VOCs associated with the MEW Superfund Site. Thus, the cumulative geographic context consists of sites adjacent to the Project Site, sites within NASA ARC, and sites in the immediate vicinity of NASA ARC.

Impact CEQA-C-HAZ-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to hazards and hazardous materials? (Less than Cumulatively Considerable with Mitigation)

Hazardous waste generated during construction of any project would be collected, properly characterized for disposal, and transported in compliance with applicable regulations. In addition, affected sites under development would undergo remediation under the oversight of applicable State and local agencies, effectively reducing the number of contaminants found in the cumulative geographic context. Hazardous materials are strictly regulated by local, State, and federal laws. Specifically, these laws are designed to ensure that hazardous materials do not result in a gradual increase in toxins in the environment. For each of the cumulative projects, various project-specific measures are and would be implemented (similar to the measures being proposed in this section) as a condition of development approval to mitigate risks associated with exposure to hazardous materials. However, due to the Project Site's historical land use and current environmental conditions, cumulative projects in the vicinity of the Project Site and NASA ARC could result in construction impacts related to the routine transport, disposal, or handling of hazardous materials; intermittent use and transport of petroleum-based lubricants, solvents, and fuels; and transport of affected media to and from sites. As discussed above, the CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) could create a hazard for the public or the environment through the routine transport, use, or disposal of hazardous materials during construction. Therefore, the impacts of the cumulative projects, combined with the proposed project, would result in a significant cumulative impact related to hazards and hazardous materials.

Implementation of Mitigation Measure HAZ-1 requires compliance with the Spring 2026 project-specific EIMP, which would protect human health and the environment. Therefore, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would not result in a cumulatively considerable contribution to significant environmental impacts on hazards and hazardous materials.

3.10 Hydrology and Water Quality

3.10.1 Introduction

This section evaluates the potential impacts on hydrology and water quality that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Project Site as well as the regulatory framework for this analysis.

Relevant technical documentation used in this analysis includes the following technical studies prepared for the project:

- *Environmental Issues Management Plan Berkeley Space Center Premises Parcels 1A, 3, 5A, 5B, and 6A Former NAS Moffett Field, California* (Spring 2026 project-specific EIMP) prepared by EKI, Spring 2026[1] (Appendix 2-2 of this joint environmental impact report/environmental impact statement [EIR/EIS]).
- *Berkeley Space Center Project, Storm Drain & Stormwater Management Master Plan* prepared by BKF, Spring 2026.
- *Berkeley Space Center at NASA Research Park Aquatic Resources Delineation Report* (Aquatic Resources Delineation) prepared by ICF, April 2026 (Appendix 3.4-2 of this joint EIR/EIS)

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. The NOP/NOI comments pertaining to hydrology and water quality include a recommendation by the U.S. Environmental Protection Agency (EPA) Region 9 to incorporate analysis of changes in stormwater volume and potential changes in contaminants or pollutants as well as impervious/pervious surfaces on the Project Site. The City of Sunnyvale also included a recommendation to consider the adequacy of stormwater service to the Project Site. These issues are addressed under Impacts CEQA-HYD-1 and CEQA-HYD-3.

3.10.2 Affected Environment/Environmental Setting

3.10.2.1 Regional Setting

Surface Hydrology

The Project Site is within the Saratoga Creek-Frontal San Francisco Bay Estuaries Watershed of the larger San Francisco Bay Basin Watershed. The Saratoga Creek-Frontal San Francisco Bay Estuaries Watershed encompasses approximately 195 square miles. Headwaters of Saratoga Creek are in the Santa Cruz Mountains. Other major creeks in the watershed include San Tomas Aquino Creek, Stevens Creek, Permanente Creek, Adobe Creek, and Barron Creek. Creeks in the watershed drain a highly urbanized watershed and flow into San Francisco Bay. Stevens Creek is a perennial stream

[1] The Spring 2026 project-specific EIMP is currently under review by the EPA and the San Francisco Bay Regional Water Quality Control Board, the regulatory agencies that will approve of the EIMP. NASA has previously reviewed and provided comments on the EIMP.

that discharges to the San Francisco Estuary north of Moffett Field Naval Air Station. Stevens Creek is less than 0.6 mile west of the Project Site and is separated by adjacent existing development.

Historically, the vicinity of the Limits of Work was composed of tidal marshes and marsh transition zones with a meandering system of tidal sloughs and intermittent and ephemeral creeks. However, levees, fill, and drainage ditches have modified the area; the natural drainage system and previous tidal effects have generally been removed. Currently, the Project Site is fully developed and covered with a substantial amount of impervious hardscape, including roofs, surface parking lots, streets, and paths, which cover approximately 70 percent of the Project Site.

Water Quality

Water quality in a typical surface water body is influenced by processes and activities that take place within the watershed. The quality of the stormwater runoff from the Project Site and surrounding development is typical of urban watersheds where water quality is affected primarily by discharges from both point and nonpoint sources. Point-source discharges are discharges that one can point to as known sources of pollutants, while nonpoint source discharges generally result from diffuse sources, such as land runoff, precipitation, or seepage. Point and nonpoint sources include outfalls, winter storms, overland flows, exposed soil, roofs, parking lots, and streets.

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) requires the State Water Resources Control Board (State Water Board) or a Regional Water Quality Control Board (Regional Water Board) to adopt basin plans for the protection of water quality. The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) specifies region-wide and water body–specific beneficial uses and sets numeric and narrative water quality objectives for surface waters. The Basin Plan specifies beneficial uses that apply to water bodies with potential to be affected by the proposed project, as shown in Table 3.10-1.[2]

Table 3.10-1. Beneficial Uses for Surface Waters with Potential to Be Affected by the Proposed Project

Water Body	Designated Beneficial Uses
Stevens Creek	FRSH; GWR; COLD, MIGR; RARE; SPWN; WARM; WILD; REC-1; REC-2

Source: San Francisco Bay Regional Water Quality Control Board. 2024. *Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan).* Originally published January 18, 2007. Acronyms:

COLD: Cold Freshwater Habitat	FRSH: Freshwater Replenishment
GWR: Groundwater Recharge	MIGR: Fish Migration
RARE: Preservation of Rare and Endangered Species	REC-1: Water Contact Recreation
REC-2: Noncontact Water Recreation	SWPN: Fish Spawning
WARM: Warm Freshwater Habitat	WILD: Wildlife Habitat

Section 303(d) of the federal Clean Water Act (CWA) requires states to make a list of waters that are not attaining water quality standards. The San Francisco Bay Regional Water Board has not listed Stevens Creek as an impaired water body. However, Stevens Creek drains into South San Francisco

[2] San Francisco Bay Regional Water Quality Control Board. 2024. *Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan).* Originally published January 18, 2007. Last updated in 2024. Available: https://www.waterboards.ca.gov/sanfranciscobay/basin_planning.html. Accessed: August 12, 2025.

Bay, which is listed as an impaired water body. The 303(d)-listed impairments for South San Francisco Bay shown in Table 3.10-2 are based on the 2024 California Integrated Report.

Table 3.10-2. Water Quality Impairments within the Vicinity of the Limits of Work

Water Body	Listed Impairment	Potential Sources	EPA TMDL Report Completion
South San Francisco Bay	Chlordane	Unknown	2037
	DDT	Unknown	2037
	Dieldrin	Unknown	2037
	Dioxin compounds (including 2,3,7,8-TCDD)	Unknown	2037
	Furan compounds	Unknown	2037
	Invasive species	Unknown	2037
	Selenium	Unknown	2037
	Mercury	Unknown	02/12/2008
	PCBs, including dioxin-like	Unknown	03/29/2010

Acronyms: DDT: dichlorodiphenyltrichloroethane
EPA: U.S. Environmental Protection Agency
TMDL: total maximum daily load
PCBs: polychlorinated biphenyls
2,3,7,8-TCDD: 2,3,7,8-tetrachlorodibenzo-p-dioxin

South San Francisco Bay is designated as impaired for mercury. Fish tissue collected from San Francisco Bay often contains relatively high mercury concentrations. Sources of mercury include runoff from historic mines, urban runoff, wastewater discharges, atmospheric deposition, and resuspension of historic deposits of mercury-laden sediment already in San Francisco Bay. Most of the historic mercury deposits date back to the gold rush of the 1800s when mercury was mined throughout the Coastal Range and used in the Sierra Nevada to extract gold. The largest source of mercury is the Central Valley where rivers carry mercury from remote regions to San Francisco Bay. The U.S. Environmental Protection Agency (EPA) approved a Basin Plan amendment, incorporating a total maximum daily load (TMDL) for mercury in San Francisco Bay, and an implementation plan to achieve the TMDL, which became effective on November 7, 2007.

Groundwater

The Project Site is within the Santa Clara Valley Groundwater Basin, Santa Clara subbasin. The Santa Clara subbasin covers an area of approximately 153,600 acres. It is bound by the Diablo Range to the west and the Santa Cruz Mountains to the east. The subbasin extends from the northern border of Santa Clara County to the groundwater divide near the town of Morgan Hill. Groundwater in the subbasin generally follows ground surface topography, flowing northerly toward San Francisco Bay. A large inland valley is the dominant geohydrologic feature in the subbasin.[3]

Recharge in the Santa Clara subbasin occurs primarily through infiltration from streambeds and percolation resulting from precipitation. The Santa Clara Valley Water District conducts an artificial recharge program in the subbasin. From the early 1900s to the mid-1960s, groundwater levels have

[3] California Department of Water Resources. 2004. *Santa Clara Valley Groundwater Basin, Santa Clara Subbasin Bulletin 118.* February 27.

declined due to groundwater pumping, which induced subsidence and degraded groundwater quality through saltwater intrusion in the shallow aquifer adjacent to San Francisco Bay. Prolonged drought resulted in lower groundwater levels and storage in the Santa Clara subbasin, prompting water use reduction in 2014, 2015, and 2016 in accordance with Valley Water's Water Shortage Contingency Plan. Full recovery of groundwater levels and storage was observed by 2017 due to community water use reduction, retailer shifts to treated surface water, and increased managed recharge.[4] In 2024, countywide recharge (172,200 acre-feet [AF]) exceeded groundwater pumping (127,000 AF) due to below-average pumping, above-average rainfall, and the availability of surface water for managed recharge.[5] The Department of Water Resources (DWR) determined that the Santa Clara subbasin is a high-priority basin. Groundwater pumping exceeds natural replenishment, and managed recharge is needed to ensure a balanced water budget and avoid chronic overdraft. Due to managed recharge of local imported water and in-lieu recharge activities, the Santa Clara subbasin is not in a condition of chronic overdraft.[6] Groundwater management policies in the subbasin, including strategies and groundwater management programs, are provided in the *Groundwater Management Plan for the Santa Clara and Llagas Subbasins.* More information regarding the Groundwater Management Plan are provided in Section 3.10.3.2 *State Regulations*. other Recent countywide monitoring has indicated that groundwater quality and seawater intrusion trends are generally stable or improving. California's groundwater standards are designed to protect state aquifers and maintain safe drinking water standards. Groundwater quality in the Santa Clara subbasin is generally good in principal aquifer zones, with median total dissolved solids (TDS) below the secondary drinking water standard of 500 milligrams per liter (mg/L) and the median nitrate level below the primary drinking water standard of 10 mg/L. Nitrate and TDS concentrations are generally stable or decreasing over time. Nitrates and per- and polyfluoroalkyl substances (PFAS) are the primary groundwater quality concerns in the subbasin. Samples from tested water supply wells indicated that water from 90 percent of the wells was below maximum contaminant levels (MCLs).[7]

Existing beneficial uses of the Santa Clara subbasin include municipal and domestic water supply, industrial process water supply, industrial service water supply, and agricultural water supply. There are several hazardous-material sites (i.e., Superfund sites) within or surrounding the Project Site, as well as hazardous-material release sites, that have affected localized groundwater quality. The Project Site is located within the NASA NRP portion of the Naval Air Station (NAS) Moffett Field Superfund Site, and soil and groundwater on the Project Site have been affected through historical use by the Navy, as well as by the migration of groundwater containing chlorinated volatile organic compounds (VOCs) from the upgradient Middlefield-Ellis-Whisman (MEW) Superfund Site located south of the Project Site in the city of Mountain View. Therefore, the untreated groundwater underlying the Project Site cannot be used for drinking water supplies or other beneficial uses. Additional information on hazardous-material sites within or surrounding the Project Site is provided in Section 3.9, *Hazards and Hazardous Materials*, of this EIR/EIS, as well as in Appendix 2-2, *Environmental Issues Management Plan*, and Appendix 3.9-1, *Hazardous Material Conditions Memorandum*.

Flood Hazards

Regional flooding is caused by freshwater flows in major streams that outfall to the San Francisco Bay, along with saltwater flooding along the bayfront and the effects of high tides. Some areas are designated as special flood hazard areas. These areas can be flooded during large storms, including a 1 percent annual storm event, also known as a 100-year flood. Prior to construction of National Aeronautics and Space Administration Ames Research Center (NASA ARC), surface drainage at the Project Site flowed toward Stevens Creek and ultimately north toward San Francisco Bay. Low lying areas, especially areas adjacent to the San Francisco Bay are susceptible to flooding. Historically, tidal marsh covered a large area including a portion of the northern area of what is now ARC.[8] Earthen levees were originally constructed to enclose salt ponds, but did not provide adequate protection against extreme freshwater and saltwater flooding events.[9] Protective levees were also constructed to prevent flooding but were inadequate during high tides, including the 2-year and 100-year tide. The area was subject to the 100-year Stevens Creek flood until 1982 when the Santa Clara Valley Water District made substantial channel and levee improvements. Flood improvements include major modifications to the Stevens Creek dam in 1985–1986 to address seismic stability and spillway capacity issues. In 1985, an additional 231,000 cubic yards of material was also added to the Stevens Creek dam, raising it 10 feet.[10]

A flood insurance rate map (FIRM) is an official Federal Emergency Management Agency (FEMA) map of a community. It is used to delineate both the special flood hazard areas and the flood-risk premium zones that are applicable to a community. Areas of the city of Santa Clara have FIRM maps that were completed in 2009, although a small area of the city has updated flood zone delineations from 2024. The area outside of Moffett Field is within FEMA Flood Zone X (shaded), an area with a reduced flood risk because of levees, as shown in Figure 3.10-1, FEMA Flood Zones. North of Moffett Field is FEMA flood Zone AE, the 100-year floodplain where base flood elevations are known. However, the majority of Moffett Field, including the entire Project Site, is within FEMA Zone D, an area with possible but undetermined flood hazards. Zone D corresponds to areas landward of levee systems that do not meet FEMA's accreditation standards and indicates that while flood risk remains, the probability of that flood risk has not been quantified.[11]

A tsunami is a series of ocean waves caused by the displacement of a large volume of water, typically resulting from an undersea earthquake or landslide. As depicted on the Tsunami Inundation Map for Emergency Planning prepared by the California Emergency Management Agency and California Geological Survey, some areas in the city immediately adjacent to the San Francisco Bay are within a tsunami inundation area. However, the Project Site is not within a tsunami inundation area.[12]

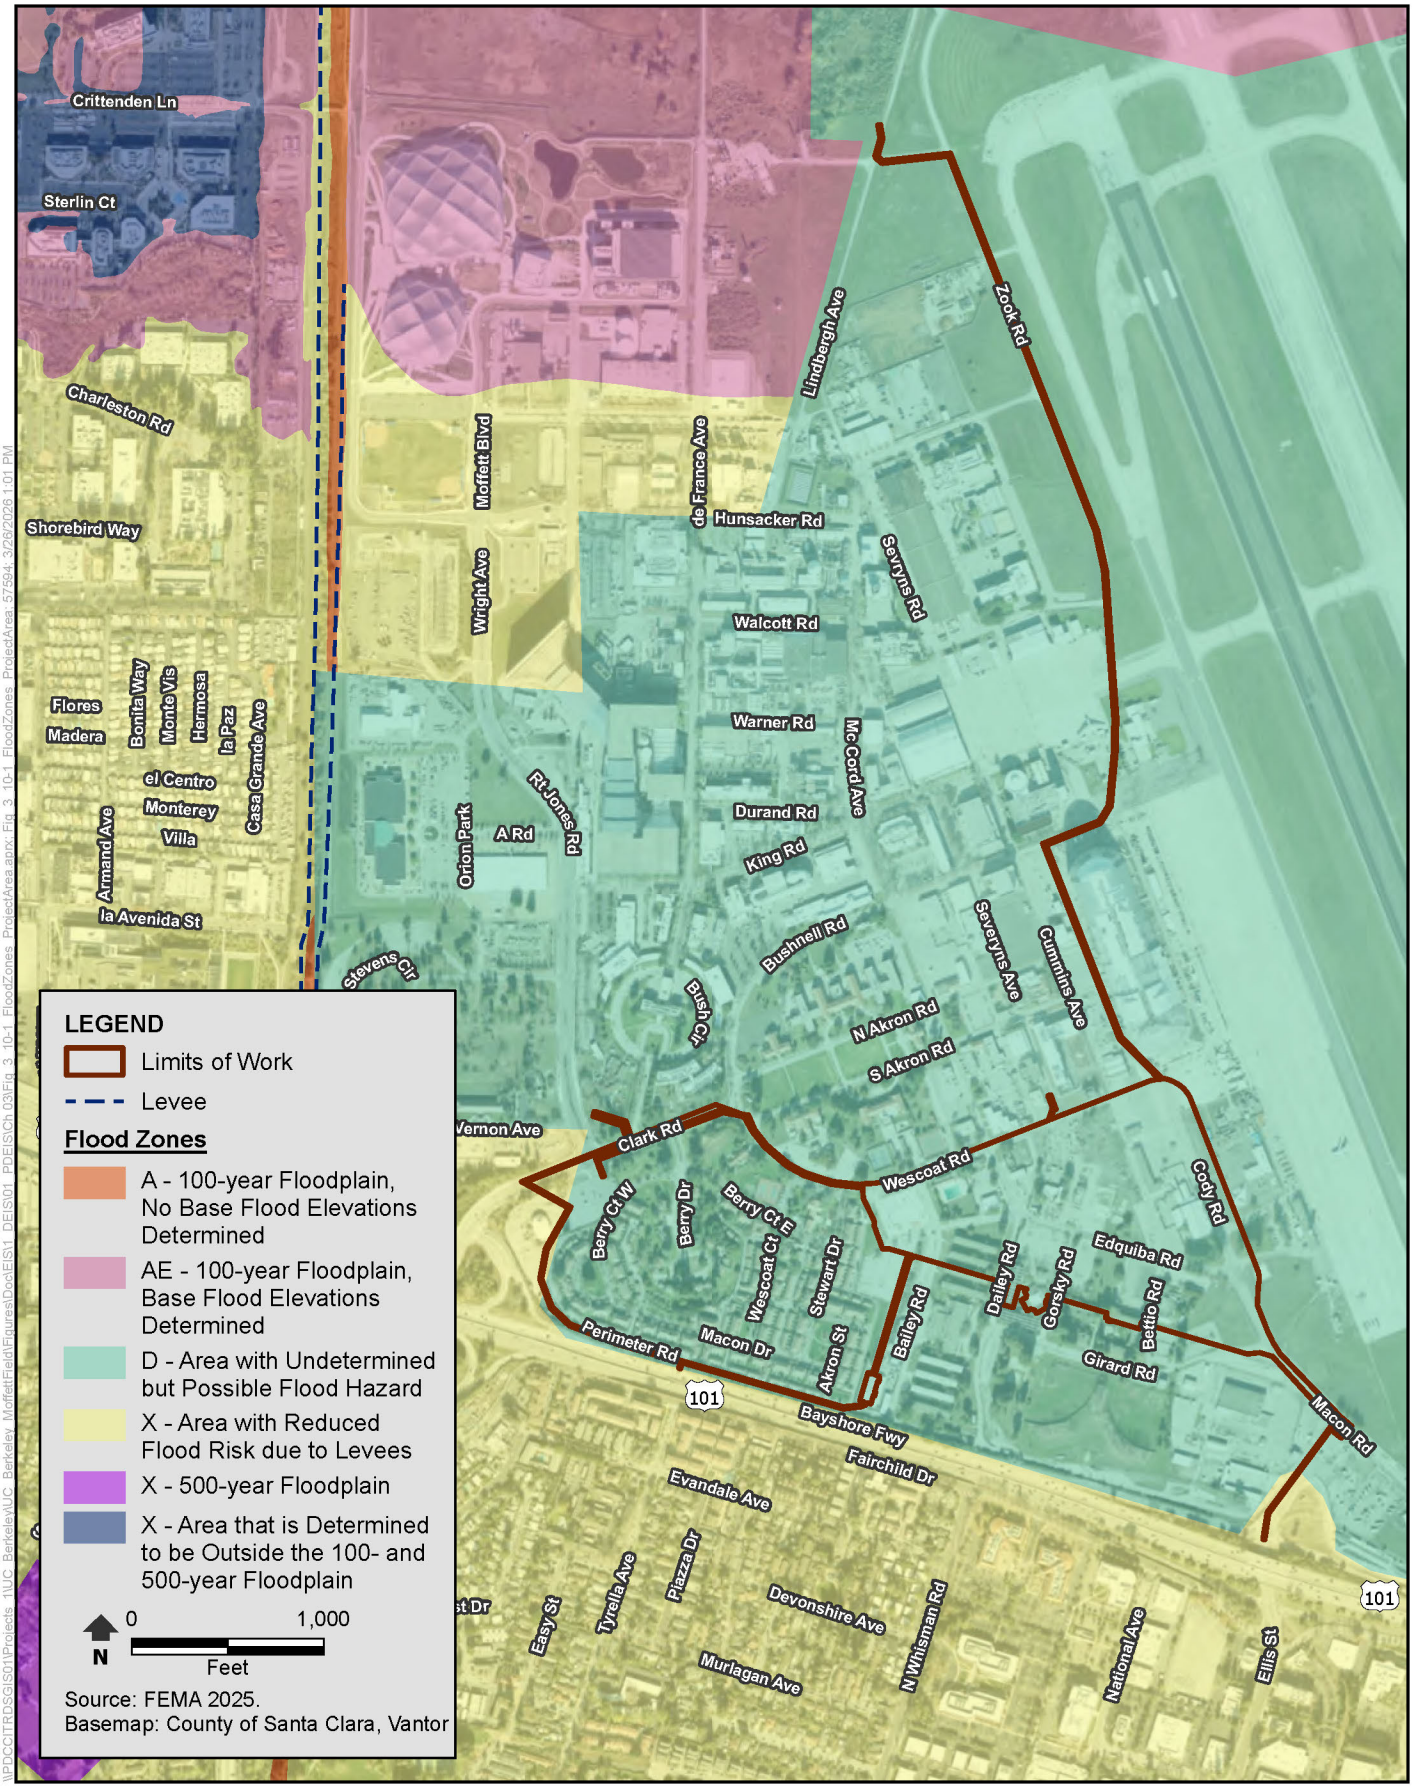

Figure 3.10-1
FEMA Flood Zones
Berkeley Space Center at NASA Research Park

Seiche occurs in an enclosed or partially enclosed body of water, such as a lake or reservoir. San Francisco Bay is a large, open body of water with no immediate risk of seiche. No larger bodies of water are near the Project Site. There would be minimal to no risk of inundation from a seiche event in the vicinity of the Project Site.

Sea Level Rise

Projected sea level rise (SLR), an effect of climate change, is expected to increase the number of areas that experience coastal flooding along the San Francisco Bay in the future. Increases in sea level are already being observed along Santa Clara County's coast. Coastal and low-lying areas, such as the Project Site, are particularly vulnerable to SLR. More specifically, SLR is a concern for the future, particularly in combination with storm events and coastal flooding. A scenario with 100-year high tides, taking into account SLR over a 50- or 100-year horizon, would substantially increase the risk of flooding in the vicinity of the Project Site.[13]

Projections regarding the extent of SLR go from low-risk scenarios up to high-risk scenarios. According to the mid-century (2050) high-risk scenario, 1.3 feet of SLR would not inundate the Project Site or the Limits of Work. With the end-of-century (2100) high-risk scenario (i.e., 6.5 feet of SLR), the Project Site would not be inundated. However, the Limits of Work, immediately south of the eastern diked marsh and western diked marsh (adjacent to Zook Road), would be inundated.[14]

3.10.2.2 Project Site

Surface Hydrology

NASA ARC contains two stormwater drainage systems – the Western Drainage System and the Eastern Drainage System, as shown in Figure 3.10-2, NASA Overall Existing Storm Drain System. The majority of the Project Site is in the Western Drainage System, which encompasses five subsystems that drain north to the western diked marsh or the eastern diked marsh, both of which are approximately 1 mile north of the Project Site. The diked marshes ultimately discharge farther north and into NASA ARC's stormwater retention pond (SWRP). Stormwater passes through a stormwater settling basin prior to discharging to the SWRP north of the Project Site. The SWRP does not have an outfall. During most of the year, water leaves the pond through evapotranspiration. Only a portion on the southeastern edge of the Project Site is in the Eastern Drainage System. Stormwater within the Eastern Drainage System flows to the Northern Channel. According to the Aquatic Resources Delineation, approximately 0.014 acre of palustrine emergent wetland is 33 feet outside of the Limits of Work. The palustrine emergent wetland is part of a larger SWRP. No surface water bodies are within the Limits of Work, and there are no major stormwater facilities in the Limits of Work. The existing NASA Ames storm drain system north of the Project Site is at capacity; the stormwater infrastructure has not been upgraded since 2001.[15]

Water Quality

Water quality in the vicinity of the Project Site is directly affected by stormwater runoff from adjacent streets and properties, which deliver fertilizers, pesticides, automobile and traffic-related pollutants (e.g., oil, grease, metals), sediment with associated pollutants from soil erosion, trash, and other pollutants. Because NASA ARC is at the bottom of the watershed and the majority of the watershed supports urban land uses, surface runoff reflects water quality typical of urban or developed streams where various types of point- and nonpoint source pollutants affect water quality. Low levels of organic compounds have been detected in effluent stormwater; however, levels were not considered substantial. A 930-square meter (10,000-square foot) concrete Stormwater Settling Basin was built at ARC. The basin removes oil, grease, and particulate matter before runoff is discharged to the diked SWRPs south of the U.S. Fish and Wildlife Service (USFWS) salt ponds. NASA removes sediment from the settling basin annually and tests for VOCs and metals to ensure appropriate disposal.[16] Water quality impairments that apply to water bodies with the potential to be affected by the Project Site are discussed above in the *Regional Setting* subsection. Current or formerly contaminated sites encompass the whole Project Site, as discussed above and in Section 3.9, *Hazards and Hazardous Materials*, and could affect water quality.

The Project Site is located within the NRP portion of the NAS Superfund Site, and soil and groundwater on the Project Site have been affected through historical use by the Navy, as well as by the migration of groundwater containing chlorinated VOCs originating south of the Project Site from the portion of the MEW Superfund Site located in the city of Mountain View.[17] The Project Site was formerly part of the NASA Moffett Field military site (Parcels 1A, 3, 5A, 5B, and 6A) operated by the U.S. Military between 1933 and 1994 and subsequently transferred to NASA in 1994. Contaminant sources are primarily associated with historical use of underground storage tanks (USTs) and sumps that contained petroleum hydrocarbon products and/or chlorinated VOCs. Closed military-related USTs on the Project Site resulted in releases from USTs of potential contaminants of concern, including an oil/water mix; motor, hydraulic, and lubricating fluids in designated drinking water aquifers[18] and soils; boiler fuel in groundwater (not used for drinking water) and soils; and diesel, gasoline, and waste oil.[19] Groundwater quality concerns in the vicinity of the Project Site related to former land uses are detailed below.

Groundwater

The depth to groundwater on the Project Site ranges from 5 to 12 feet below ground surface, although groundwater levels may fluctuate due to variations in rainfall, seasonal variations, underground drainage patterns, and other factors, according to the Spring 2026 project-specific

16 NASA Ames. 2015. *Environmental Resources Document,* Chapter 12, *Hydrology and Water Quality*.

17 The portion of the MEW Vapor Intrusion Area that is located in the vicinity of the Project Site is shown on Figures 3.9-2 and 3.9-4. The MEW Vapor Intrusion Study Area represents the boundary of the MEW Superfund Site VOC groundwater plume where trichloroethene concentrations are greater than 5 micrograms per liter. No remediation activities are included as part of the CEQA Proposed Project or CEQA Reduced Density Alternative.

18 Groundwater beneath the Project Site is not used for drinking water, however the aquifers in the groundwater subbasin underlying the Project Site are defined as drinking water aquifers by the State Water Resources Control Board.

19 State Water Resources Control Board. 2025. *GeoTracker*. Accessed: https://geotracker.waterboards.ca.gov/. Accessed: August 14, 2025.

EIMP. Soils in the vicinity of the Project Site have low permeability due to high clay content, resulting in little to no groundwater recharge.[20]

A large regional plume of chlorinated VOCs is present on-site and is associated with portions of the MEW Superfund Site located south of U.S. 101, as shown in Figure 3.10-3, Groundwater Plume and Groundwater Wells. The plume has commingled with groundwater contamination from Navy chlorinated solvent sources located in the NRP and NASA sources in NASA ARC. VOCs are the primary chemicals of potential concern found on the Project Site. The primary VOC constituents of concern within the plume are trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE). Tetrachloroethene (PCE) was also detected during groundwater monitoring; therefore, it is monitored as a VOC within the plume. Other VOCs within the plume have generally been reported below actionable levels. The contamination originated south of U.S. 101 at the MEW Superfund Site. VOCs transported in groundwater originating from the MEW site moving northerly and toward the San Francisco Bay continue to contaminate groundwater under the Project Site. Other groundwater quality concerns include total petroleum hydrocarbons as hydraulic oil (TPH-HO) above the NASA risk-based screening level of 100 micrograms per liter [µg/L]).[21] Petroleum hydrocarbons and fuel-related constituents, such as benzene, toluene, ethylbenzene and xylenes (BTEX) have also affected groundwater beneath the Project Site, according to the Spring 2026 project-specific EIMP. Metals and per- and polyfluoroalkyl substances (PFAS) compounds were also detected in groundwater.[22] Groundwater throughout the NRP is regularly monitored for groundwater quality. Groundwater wells were previously monitored up to semi-annually; however, in 2018, the groundwater monitoring frequency was revised to occur every 2 years.[23]

To address groundwater impacts in the vicinity of the Project Site, two groundwater extraction and treatment facilities are currently operating near the Project Site, the MEW Superfund Site Groundwater Treatment System (GWTS) and the NASA West-Side Aquifers Treatment System (WATS). The MEW extraction and GWTS is directly adjacent to the Project Site. Piping for the system is partially within the Project Site while the GWTS is outside of the Project Site. Remediation system infrastructure (found on-site) associated with the MEW extraction and GWTS includes several recovery wells and underground piping. Treated water from the MEW GWTS facility is discharged into Stevens Creek, which connects to San Francisco Bay. Treated groundwater from the WATS is discharged into NASA's stormwater system which discharges into the eastern diked marsh in the northernmost portion of NASA ARC. The WATS is owned and operated by NASA The WATS discharges to NASA's stormwater system by a bypass which allows treated groundwater to be reused by NASA.

Graphics ... 104894 (2-10-2026)

Figure 3.10-3
Groundwater Plume and Groundwater Wells
Berkeley Space Center at NASA Research Park

Environmental investigations, removal actions, and remedial actions have been implemented at the former NAS Moffett Field since 1984, as detailed in Appendix 2-2, *Environmental Issues Management Plan*. Remediation includes installation and operation of groundwater remediation systems and groundwater monitoring wells.[24,25] Remediation activities include groundwater extraction and treatment to control and remove VOCs that would otherwise migrate beyond the recovery wells. The current VOC and Fuel General Permit (Order No. R2-2017-0048, National Pollutant Discharge Elimination System [NPDES] permit No. CAG912002, as amended by Order No. R2-2018-0050), was adopted on December 13, 2017.

Remediation activities include groundwater extraction and treatment designed to control and remove VOCs that are migrating beyond the source control recovery wells. Groundwater extracted from the Regional plume in the vicinity of the Project Site is conveyed to the North 101 Treatment System, which is outside of the Project Site. A pipeline with double containment that transports extracted groundwater to the North 101 Treatment System runs through the Project Site. Double containment provides protection from contaminated water, which, without such protection, could leak into surrounding soils as it is transported to the treatment system facility.[26]

Flood Hazards

The Project Site is within FEMA Flood Zone D, an area with possible but undetermined flood hazards. FEMA floodplain mapping has not been conducted for the Limits of Work. The NRP has protection from Bay flooding via levees, although localized flooding has occurred due to precipitation. This localized flooding occurred outside of the Limits of Work (approximately 800 feet north of the Project Site) and was not considered a 100-year storm event. No known or reported flooding issues exist within the Limits of Work.[27] The Project Site is approximately 2.5 miles inland from the shoreline of San Francisco Bay. The Limits of Work is approximately 1.5 miles inland from the shoreline of San Francisco Bay. Therefore, the potential for inundation due to tsunami or seiche is considered low. The area adjacent to the San Francisco Bay, also outside the Limits of Work, is on low-elevation lands that have been identified as tidal floodplains and areas that are subject to flooding. The expected 2-, 100-, and 500-year flood limits are less than 1 mile north of the Limits of Work.

3.10.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance. For the purposes of CEQA, UC Berkeley has elected to use the Statewide NPDES Construction General

[24] EKI. 2026. *Environmental Issues Management Plan (EIMP) Berkeley Space Center Premises Parcels 1A, 3, 5A, 5B, and 6A Former NAS Moffett Field, California*. Spring.

[25] The MEW Regional Groundwater Remediation Program owns and is responsible for nine source control recovery wells in the study area. Fairchild (a MEW group) and the Navy own additional monitoring wells throughout the study area.

[27] Ibid.

Permit, Santa Clara Valley Urban Runoff Pollution Prevention Program, San Francisco Bay Municipal Regional Stormwater Permit, and Groundwater Management Plan for the Santa Clara and Llagas Subbasins for the analysis of hydrology and water quality associated with the project.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, state and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and state environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, state and local government requirements will not be considered as applicable to the proposed action, when the proposed action and environmental effects are located on ARC jurisdictional property. This includes mitigation measures proposed in accordance with those state and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies. For the purposes of NEPA, NASA has elected to apply the standards identified in the Santa Clara Valley Urban Runoff Pollution Prevention Program, San Francisco Bay Municipal Regional Stormwater Permit, Construction General Permit, and Groundwater Management Plan for the Santa Clara and Llagas Subbasins for the analysis of hydrology and water quality with the project.

This section summarizes plans, policies, and regulations considered in the analysis.

3.10.3.1 Federal Regulations

Clean Water Act

The CWA is the primary federal law in the United States that governs water pollution. Its objectives are to restore and maintain the chemical, physical, and biological integrity of the nation's waters; recognize the responsibilities of the states in addressing pollution and provide assistance to do so, including funding for publicly owned treatment works to improve wastewater treatment; and maintain the integrity of wetlands.

Section 303 – Impaired Waters

The term “303(d) list” refers to a state’s list of impaired and threatened waters (e.g., stream/river segments, lakes). States are required to submit their list for EPA approval every 2 years. For each water body on the list, the state identifies the pollutant causing the impairment, when known. In addition, the state assigns a priority for development of TMDLs, based on the severity of the pollution and the sensitivity of the uses within the waters, among other factors.

In general, once a water body has been added to a state’s list of impaired waters, it stays there until the state develops a TMDL and EPA approves it. EPA reporting guidance provides a way to keep track of a state’s water bodies, from listing as impaired to meeting water quality standards. This tracking system provides a running account of all water bodies in a state and categorizes each according to the attainment status. For example, once a TMDL is developed, a water body is no longer on the 303(d) list, but it is still tracked until the water body is fully restored.

Section 401 – Water Quality Certification

This program is responsible for regulating discharges of dredged or fill material to waters of the state. The State Water Board and the Regional Water Boards (collectively, Water Boards) have the authority to regulate these discharges under Section 401 of the CWA and Porter-Cologne Act.

CWA Section 401 water quality certifications are issued to applicants for a federal license or permit to cover activities that may result in a discharge into waters of the United States, including the discharge or dredged or fill material. Waste discharge requirements under Porter-Cologne Act are issued for discharges of dredged or fill material to waters of the state.

Section 402 – National Pollutant Discharge Elimination System

Section 402 of the CWA requires a discharge of any pollutant or combination of pollutants to surface waters that are deemed waters of the United States to be regulated by an NPDES permit. To provide coverage to water purveyors for discharges to waters of the United States made in compliance with CWA Section 402, the State Water Board adopted the Statewide General NPDES Permit for Drinking Water System Discharges to Waters of the United States on November 18, 2014. To obtain coverage under the permit, a water purveyor (e.g., community drinking water system or wholesaler) must submit an application to the State Water Board no later than September 1, 2015. Alternatively, if a water purveyor does not need coverage under the permit, it must submit a notice of non-applicability to the State Water Board, also by September 1, 2015.

Section 404 – Dredge/Fill Permitting

Section 404 of the CWA prohibits the discharge of excavated or fill material into waters of the United States (jurisdictional waters) without a permit from the U.S. Army Corps of Engineers (USACE).

National Flood Insurance Program

The National Flood Insurance Program (NFIP) provides flood insurance to property owners, renters, and businesses. Having this coverage helps them recover faster after a flood. The NFIP works with communities, which are required to adopt and enforce floodplain management regulations to mitigate the effects of flooding.

Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act directs the USFWS to investigate and report on proposed federal actions that affect any stream or other body of water and provide recommendations to minimize impacts on fish and wildlife resources.

Executive Order 11988

Issued in May 1977, this executive order directs federal agencies to:

1. Assert leadership in reducing flood losses and losses to environmental values served by floodplains;
2. Avoid actions located in or adversely affecting floodplains, unless there is no practicable alternative;
3. Take action to mitigate losses if avoidance is not practicable; and

4. Establish a process for flood hazard evaluation, based on the 100-year base-flood standard of the NFIP. It also directed federal agencies to issue implementing procedures, provided a consultation mechanism for developing the implementing procedures, and provided oversight mechanisms.

Ames Research Center Directives

The Ames Research Center Directives and Ames Procedural Requirement (APR)[28] are a public listing of NASA ARC policies and procedures. These policies ensure compliance with NASA's standards and authorize review, assessment, and approval of projects at NASA ARC. The policies also address NASA ARC's conformance with federal, state, and local land use plans and regulations. The following Ames Policy Directives (APDs) and APRs would be applicable to the Project Site:

- **APD 8500.1: Ames Environmental Policy.** Demonstrates pollution prevention practices and continual improvement of NASA ARC's environmental program. The Environmental Management Division is responsible for establishing and overseeing the following programs to ensure compliance with applicable laws and NASA's policy: drinking water, industrial wastewater, spill prevention control and countermeasures, air quality, stormwater, hazardous materials, hazardous waste, restoration, NEPA, natural resources, and sustainability.
- **APD 8829.1: Construction Permits.** Establishes Ames-specific policies and responsibilities for construction activities. The policy of NASA ARC is that all construction work is to be reviewed in adherence to all appropriate and applicable building and construction codes and standards. This review shall be performed according to a construction permit process established for the request, review, and approval of all construction permits at NASA ARC.
- **APD 8835.1: Landscaping Planting and Grooming.** Establishes policies for NASA ARC grounds and landscaping.
- **APR 8553.1: NASA Environmental Management System.** Sets forth requirements for the NASA Environmental Management System (EMS), which functions primarily to (1) incorporate people, procedures, and work practices into a formal structure to ensure that the important environmental impacts of the organization are identified and addressed; (2) promote continual improvement, including periodically evaluating environmental performance; (3) involve all members of the organization, as appropriate; and (4) actively involve senior management in support of the agency. The EMS employs a standardized approach to managing environmental activities that allows an efficient, prioritized system execution while at the same time helping to improve environmental performance and maintain compliance with applicable environmental regulations and requirements. NASA's EMS approach involves identifying all activities, products, and services under each NASA center's control and the environmental aspects associated with each center's continued engagement in those activities, products, and services. Once identified, priority environmental aspects are assigned a risk ranking (from 1 to 4, based on severity and frequency of occurrence) and evaluated on a continual basis as means of highlighting associated positive or negative impacts and setting objectives and targets to reduce environmental risk. Each center's EMS also identifies methods for ensuring compliance by keeping abreast of environmental requirements. This includes requirements by law (executive orders, federal regulations, state and local laws) and voluntary commitments made by the center or NASA.

[28] National Aeronautics and Space Administration. 2024. *Ames Research Center Directives*. Available: https://www.nasa.gov/ames-research-center-directives/. Accessed: November 18, 2025.

- **APR 8829.1: Construction Permit Process.** Establishes the construction permit process and the requirements imposed on all construction activities at NASA ARC. ARP 8829.1 establishes minimum requirements to provide a reasonable level of safety, public health, and general welfare through structural strength, means of egress facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire, explosion, and other hazards and provide a reasonable level of safety to fire and emergency responders during emergency operations. For NRP projects, the Project Proponent must first engage in the NRP design review process (described above) and obtain approval from the NRP design review board before approval of a construction permit. These planning review and approval procedures ensure consistency with Ames master planning and compatibility with other planned work as well as the project definition and readiness.

NASA Ames Development Plan

The NASA Ames Development Plan (NADP) is the long-term master plan for NASA's federal campus at Moffett Field published in 2002. The NADP details transformation of the original 500-acre campus of ARC and 1,500 acres of the former Naval Air Station Moffett Field into an integrated, dynamic research and education community. The transformation was led by the establishment of the NRP, a research-and-development campus for partners from academia, industry, and non-profit organizations with shared goals in support of NASA's mission.

The NADP includes planning principles that help guide the development throughout the entirety of NASA ARC. The planning principles include environmental issues management and wetland preservation. The environmental issues management planning principle indicates that all partners will be required to comply with the NASA NRP EIMP and NASA Ames' Environmental Compliance Program. The wetland preservation planning principle indicates that NASA Ames will avoid construction in non-tidal wetlands to reduce potential impacts to sensitive habitats. Development plans will ensure no net loss of wetland functions, values or acreage

3.10.3.2 State Regulations

Porter-Cologne Water Quality Control Act

The State Water Board coordinates with the nine Regional Water Boards to preserve, protect, enhance, and restore water quality. Each Regional Water Board makes decisions related to water quality for its region and may approve, with or without conditions, or deny projects that could affect waters of the state. The Regional Water Board's authority comes from the CWA and the Porter-Cologne Act, which broadly defines waters of the state as "any surface water or groundwater, including saline waters, within the boundaries of the state." Because the Porter-Cologne Act applies to any water, whereas the CWA applies only to certain waters, California's jurisdictional reach may overlap and exceed the boundaries of waters of the United States, pursuant to the CWA. Under the Porter-Cologne Act, the State Water Board and the nine Regional Water Boards are responsible for granting CWA NPDES permits and establishing waste discharge requirements for certain point-source and nonpoint-source discharges to waters. These regulations limit impacts on aquatic and riparian habitats from a variety of urban sources.

McAteer-Petris Act

Under the McAteer-Petris Act, the Bay Conservation and Development Commission (BCDC) has jurisdiction over all tidal areas of the San Francisco Bay, marshlands between mean high tide and 5 feet above mean sea level, a band extending 100 feet landward of the San Francisco Bay shoreline, salt ponds, managed wetlands that have been diked off from the San Francisco Bay, and certain waterways. BCDC has authority to permit projects, including those to construct a structure, within its jurisdiction. The proposed storm drain outfall may encroach on the BCDC jurisdictional boundary. However, the coastal zone would not be affected by the proposed project, and the Project Site's status as an Airport Priority Use Area in the Bay Plan would not be affected by the proposed project. Thus, the proposed project would not require a consistency determination or other approval from BCDC. The area west of Lindbergh Avenue where the proposed off-site storm drain main and the outfall at the eastern diked marsh would be constructed is federally owned but within the boundary of the city of Mountain View. This falls under proprietary jurisdiction and is thus subject to certain State regulations.

Water Quality Control Plan for the San Francisco Basin

The Water Quality Control Plan for the San Francisco Basin (Basin Plan) is the master policy document that contains descriptions of the legal, technical, and programmatic bases of water quality regulation in the San Francisco Bay region. The Basin Plan establishes beneficial water uses for surface waters and groundwater basins within the region, the water quality objectives needed to protect the designated beneficial water uses, and the implementation plans for achieving the water quality objectives through its regulatory programs.

State Water Resources Control Board Construction General Permit

The State Water Board adopted the statewide NPDES Construction General Permit to regulate stormwater discharges associated with construction activities. The permit is applicable to construction projects that meet certain criteria. Generally, construction activities that disturb 1 acre of soil or more, or activities that disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 acre or more, are required to obtain coverage under the Construction General Permit. The permit does not apply to disturbances on land surfaces related solely to growing crops or performing agricultural operations, such as disking, harrowing, terracing, leveling, or preparing soil.

The NPDES Construction General Permit requires development of a Storm Water Pollution Prevention Plan (SWPPP) by a certified qualified SWPPP developer. A SWPPP is a site-specific plan for achieving compliance with stormwater regulations through the use of best management practices (BMPs).

State Water Resources Control Board Industrial General Permit

Businesses conducting industrial-related activities must comply with federal, state, and regional requirements that protect the health of our communities by preventing water pollution. The State of California regulates these activities through the Industrial General Permit (IGP). Industrial activities at NRP are covered under the statewide General Permit for Storm Water Discharges Associated with Industrial Activities (Order 2014-0057-DWQ, NPDES Order No. CAS000001). NASA samples effluent from a settling basin four times per year as part of the IGP SWPPP.

State Water Resources Control Board Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries

The Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California (Plan) was adopted by the State Water Board under authority provided by Water Code Sections 13140 and 13170. Except as otherwise indicated, the Plan establishes provisions for water quality and sediment quality that apply to all inland surface waters, enclosed bays, and estuaries and coastal lagoons of the state, including both waters of the United States and surface waters of the state. These provisions do not apply to ocean waters, including Monterey Bay and Santa Monica Bay. In accordance with Water Code Section 13170, except where otherwise noted, the provisions contained within the Plan supersede any Basin Plans for the same waters with respect to conflict.

State Water Resources Control Board Trash Amendments

On April 7, 2015, the State Water Board adopted an Amendment to the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) to Control Trash and Part 1 Trash Provision of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries. Together, they are collectively referred to as 'the Trash Amendments'. The objective for the Trash Amendments is to provide statewide consistency for the Water Boards' regulatory approach to protect aquatic life and public health beneficial uses, and reduce environmental issues associated with trash in state waters, while focusing limited resources on high trash generating areas.

The trash amendments apply to all municipal separate storm sewer system (MS4), industrial, and construction NPDES permittees. The State Water Board executive director sent separate Water Code 13383 orders to traditional and non-traditional small MS4 permittees, as well as the California Department of Transportation. Regional Water Boards, as the permitting authorities, issued Water Code 13383 orders to their Phase I permittees that contained region-specific requirements; in some cases, these differed from State Water Board orders.

Upon reissuance or amendment, State Water Board and Regional Water Board MS4 permits will contain trash control implementation requirements and compliance milestones to demonstrate progress toward 100 percent compliance with the trash provisions. On September 8, 2022, the State Water Board reissued the General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities. These reissued permits implement the trash provisions for the California Department of Transportation and construction dischargers. The General Permits for Stormwater Discharges Associated with Industrial Activities and the Small MS4 General Permit will implement the trash provisions when reissued.

Sustainable Groundwater Management Act

The historic passage of the Sustainable Groundwater Management Act (SGMA) in 2014 set forth a statewide framework to protect groundwater resources over the long term. SGMA is part of a three-bill legislative package, including Assembly Bill 1739 (Dickinson), Senate Bill 1168 (Pavley), and Senate Bill 1319 (Pavley), and subsequent statewide regulations. In signing SGMA, then-Governor Jerry Brown emphasized that “groundwater management in California is best accomplished locally.”

SGMA requires local agencies to form groundwater sustainability agencies (GSAs) for the high- and medium-priority basins. GSAs develop and implement groundwater sustainability plans (GSPs) or

Groundwater Management Plans (GWMP) to avoid undesirable results and mitigate overdraft within 20 years. The Project Site is within the Santa Clara Valley Groundwater Basin, Santa Clara subbasin, which is considered a high-priority basin. DWR approved the 2016 GWMP as an Alternative Plan on July 17, 2019, finding it satisfies the objectives of SGMA. The 2021 GWMP is the first required 5-year update to the approved Alternative Plan.[29]

3.10.3.3 Local Regulations

Santa Clara Valley Urban Runoff Pollution Prevention Program

The SCVURPPP represents an association of 13 cities and towns in the Santa Clara Valley, Santa Clara County, and the Santa Clara Valley Water District that share a common NPDES municipal stormwater permit to discharge stormwater to South San Francisco Bay. The SCVURPPP, through its member agencies, implements pollution prevention, source-control, monitoring, and outreach programs to reduce pollution in stormwater runoff and protect water quality and beneficial uses within San Francisco Bay and Santa Clara Valley creeks and rivers. The SCVURPPP values stormwater and promotes it as an important resource.

San Francisco Bay Municipal Regional Stormwater Permit

The San Francisco Bay Regional Water Board reissued the MS4 Municipal Regional Stormwater NPDES Permit (MRP), which went into effect July 1, 2022 (Order No. R2-2022-0018 NPDES Permit No. CAS612008). Like past stormwater permits, the MRP mandates stormwater control measures for specified development projects. It includes several significant changes, including changes to the types and sizes of regulated projects. The MRP was issued by the Regional Water Board.

Groundwater Management Plan for the Santa Clara and Llagas Subbasins

In 2019, DWR approved the Santa Clara Valley Water District's 2016 Groundwater Management Plan for the Santa Clara and Llagas Subbasins as an alternative, determining it satisfies the objectives of the SGMA. Periodic evaluations of approved plans are required at least every 5 years; therefore, Santa Clara Valley Water District submitted the board-adopted 2021 Groundwater Management Plan to DWR in December 2021. Annual reports must be submitted to DWR by April 1 of each year for the previous water year (October 1 to September 30).

County of Santa Clara Office of Sustainability and Resilience

The County of Santa Clara Office of Sustainability aims to maintain a healthy and safe county and enhance natural resources and the environment. Along with the County, the office is managing a regional effort to minimize impacts of climate change, including sea level rise, storm surge, and increased riverine flooding. The office also analyzes the county's vulnerability to SLR and flood hazards and develops strategies to minimize potential flood hazards in the county.

3.10.4 CEQA Findings

The following sections describe the environmental impacts of the proposed project on hydrology and water quality in accordance with CEQA. The sections describe the thresholds used to determine

[29] Valley Water. 2021. *Groundwater Management Plan for the Santa Clara and Llagas Subbasins*.

whether an impact would be significant as well as the methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts on hydrology and water quality in accordance with NEPA is provided separately in Section 4.5.9, *Hydrology and Water Quality*, in Chapter 4, *Environmental Impact Statement*.

3.10.5 Thresholds of Significance

In accordance with Appendix G of the State CEQA Guidelines, the project would have the potential to have a significant effect on hydrology and water quality if it would result in any of the conditions listed below.

Would the project:

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface water or groundwater quality?
- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project could impede sustainable groundwater management of the basin?
- Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river or the addition of impervious surfaces, in a manner that would:
    - Result in substantial erosion or siltation on- or off-site,
    - Substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site,
    - Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff, or
    - Impede or redirect flood flows?
- In flood hazard, tsunami, or seiche zones, risk a release of pollutants due to project inundation?
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to hydrology and water quality?

3.10.6 Methods for Analysis

All project elements were analyzed by comparing baseline conditions to conditions during construction and/or operation of the proposed project. The analysis focuses on issues related to surface hydrology, groundwater supply, surface water and groundwater quality, and flood hazards. The key construction and operational impacts are identified and evaluated according to the physical characteristics of the proposed project and the magnitude, intensity, location, and duration of

activities. Compliance with existing laws, regulations, and policies is assumed to be part of the baseline setting against which the proposed project's incremental impacts are assessed.

- Surface Water Hydrology. The surface water hydrology impact analysis considers changes in impervious surfaces and drainage patterns as well as information on the change in impervious surfaces, runoff, and drainage patterns.
- Groundwater Hydrology. Potential impacts on groundwater supply and recharge are analyzed using information from publicly available publications and site-specific technical reports, including the *Preliminary Geotechnical Assessment, Proposed Commercial Development, NASA Research Park*.[30] Potential impacts associated with construction dewatering are also evaluated.
- Surface Water and Groundwater Quality. Impacts on surface water and groundwater quality are analyzed using information on potential existing sources of pollution, such as vehicle use and parking, building maintenance, pesticide use, trash, and material storage, and site-specific technical reports, including the NASA Ames *2024 Annual Progress Report, Regional Groundwater Remediation Program,* and the NASA NRP South Housing Area *Environmental Baseline Survey*, *NRP South Housing Area, Final*.[31,32] As summarized in Section 3.10.2, there several hazardous-material sites (i.e., Superfund sites) within or surrounding the Project Site as well as hazardous-material release sites, which have impacted localized groundwater quality. Additional information on hazardous materials with potential to affect the proposed project is provided in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS and the Spring 2026 project-specific EIMP in Appendix 2-2. The associated impacts are compared to the potential impacts from project-related sources of pollution during construction, such as sediments and construction materials, and during project operation, such as vehicle use, building maintenance, pesticide use, trash, and the storage of hazardous materials.
- Flood Hazards. The impact analysis for flood risk uses floodplain mapping completed in vicinity of the Project Site to determine the existing flood zone. Included is information from the Floodplain and Wetlands Management – Preliminary Maps and the *Storm Drain & Stormwater Management Master Plan*[33] prepared for the proposed project regarding changes in drainage patterns and layout that may affect flooding risks.

3.10.7 Impacts Not Evaluated in Detail

Risk release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones?

The Project Site is not within a planned tsunami inundation area. Therefore, the Project Site is not subject to inundation by tsunami. Furthermore, there would be minimal to no risk of inundation from a seiche event in the vicinity of the Project Site. The portions of Santa Clara within designated

30 Geomatrix Consultants, Inc. 2000. *Preliminary Geotechnical Assessment, Proposed Commercial Development, NASA Research Park.* August 4.

31 BB&E Consulting Engineers and Professionals. 2025. *2024 Annual Progress Report, NASA Ames Regional Groundwater Remediation Program*. Prepared for NASA Ames Research Center, NASA Area of Responsibility, and Site 28 WATS Area. April 14.

32 AECOM. 2019. *Environmental Baseline Survey, NRP South Housing Area, Final*. Prepared for NASA Ames Research Center. August 19.

33 BKF. 2026. *Berkeley Space Center Project, Storm Drain & Stormwater Management Master Plan*. Spring.

Federal Emergency Management Agency (FEMA) 100-year floodplains include the area north of Moffett Field. The Project Site is within FEMA Zone D, an area with possible but undetermined flood hazards because the area has not been mapped by FEMA. There are known flooding issues north of the Limits of Work. This includes localized flooding, particularity on the northwest boundary of the Project Site and outside of the Project Site, that was not considered a 100-year storm event. The expected 2-, 100-, and 500-year flood limits are less than 1 mile north of the Project Site. Although flood hazard risks in FEMA Zone D are not well understood and the probability of a flood risk has not been quantified, no known or documented flooding issues exist within the Project Site. The proposed project would ultimately discharge a volume equivalent to the existing volume leaving the Project Site and would decrease the volume discharged to the NASA Ames storm drain system as it redirects stormwater directly to the marsh via the new trunk main, alleviating any potential flooding issues in the NASA Ames storm drain system.

Projected mid-century (2050) high-risk SLR scenario would not inundate the Project Site or the Limits of Work. Although end-of-century (2100) high-risk SLR scenario would not inundate the Project Site, the Limits of Work, including the eastern diked marsh and western diked marsh, would be inundated. However, inundation would not risk release of pollutants due to project inundation because no pollutants would be stored near the eastern diked marsh and western diked marsh. The proposed storm drain system would incorporate butt-fusion welded high-density polyethylene pipe to prevent the infiltration of contaminants into the drainage system where it could migrate farther downstream and potentially discharge into sensitive surface waters. Therefore, the proposed project would not risk release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones, resulting in no impact. This topic is not evaluated further.

3.10.8 Impacts and Mitigation Measures

***Impact CEQA-HYD-1*: *Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface water or ground water quality*?**

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	HAZ-1. Implement the Environmental Issues Management Plan	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

Surface Water Quality

Project construction activities, including grading, soil stockpiling, and other earth-disturbing activities, under all buildout options, could result in short-term water quality impacts from soil erosion and subsequent sediment transport to adjacent properties, roadways, or watercourses through storm drains. Sediment transport to local drainage facilities, such as drainage inlets and storm drains, could result in reduced storm flow capacity, resulting in localized ponding or flooding during storm events. According to the Aquatic Resources Delineation, approximately 0.014 acre of palustrine emergent wetland is 33 feet outside of the Limits of Work. No construction activities, including dredge-and-fill activities, would occur within 50 feet of the palustrine emergent wetland. There are no surface water features within the Limits of Work.

Project construction would also involve the use of motorized heavy equipment, including trucks and dozers, that require fuel, other fluids, and lubricating grease. An accidental chemical release or spill involving a vehicle or equipment could affect the quality of stormwater runoff and surface water. These construction activities could also generate dust, sediment, litter, oil, and other pollutants that could temporarily contaminate runoff from the Project Site. The CEQA Proposed Project and the CEQA Reduced Density Alternative would include the development and implementation of a SWPPP, including, but not limited to, the following BMPs: employee training, erosion and sediment controls, good housekeeping, material handling and waste management, preventive maintenance, quality assurance and recordkeeping, and spill and leak prevention and response. Construction activities must comply with the NPDES Construction General Permit and the MRP, which includes filing an NOI for permit coverage under the NPDES Construction General Permit. As part of the NPDES Construction General Permit, standard erosion control measures and BMPs would be identified in a SWPPP and implemented during construction to reduce sedimentation in waterways and loss of topsoil.

Spoils generated from grading activities would total approximately 105,500 cubic yards (cy); approximately 104,100 cy of net soil export would be required. Permits from Mountain View would be required for grading within the Limits of Work in the city of Mountain View. Otherwise, incorporation of construction BMPs and implementation of the SWPPP would sufficiently ensure no adverse impacts on surface water quality. An excavation permit would be obtained from the applicable authority having jurisdiction prior to any on-site grading. Compliance with the requirements of NASA's APR 88500.1 and APR 8829.1, along with the State Water Board's NPDES Construction General Permit, would require the use of BMPs to reduce soil erosion and sedimentation, restrict non-stormwater discharges from the construction site, and avoid a release of hazardous materials. Erosion control measures include silt fences, hay bales, fabric and sand filters, swales, and/or sumps. As a performance standard, the BMPs to be selected would represent the best available technology that is economically achievable and the best conventional pollutant control technology to reduce erosion and pollution.

Other water quality impacts could result from chemical spills into storm drains or groundwater aquifers if proper minimization measures are not implemented. However, required BMPs would be used to reduce pollutants in stormwater and other nonpoint-source runoff. Measures would range from source control to treatment of polluted runoff. BMPs could include watering active

construction areas to control dust generation during earthmoving activities; using water sweepers to sweep streets and haul routes; and installing erosion control measures, such as silt fences, staked straw bales/wattles, silt/sediment basins and traps, check dams, geofabric, and sandbag dikes, to prevent silt runoff to roadways, storm drains, or waterways. As appropriate, disturbed soil would be revegetated as soon as possible with an appropriate selection and schedule of plants. No disturbed or graded surfaces would be left without erosion control measures in place during the rainy season, which generally is between October 15 and April 15.

In addition to compliance with the NPDES Construction General Permit, UC and NASA elected to apply the standards identified in the SCVURPPP, which involve development and implementation of an erosion and sediment control plan specific to the construction site to minimize water quality impacts. The plan would be developed according to the guidance provided in documents such as the California Stormwater Quality Association (CASQA) construction BMP handbook. Adherence with CASQA guidance would ensure that construction activities would not result in a violation of water quality standards or waste discharges requirements or otherwise result in water quality degradation.

Based on this analysis, project impacts on surface water quality during construction would be less than significant.

Groundwater

The depth to groundwater on the Project Site ranges from 5 to 12 feet below ground surface (bgs), according to the Spring 2026 project-specific EIMP. Maximum excavation depths would extend to 25 feet bgs. The Central Utility Plant Option would require excavation to 11 feet bgs for the distribution pipes, which is more than the excavation needed for the typical utility improvements that would otherwise be required for the CEQA Proposed Project. Temporary construction dewatering may be required in some isolated areas of the Project Site with shallow groundwater. Dewatering could result in an exposure to pollutants from spills or other activities and may contaminate groundwater. Groundwater dewatering may also mobilize existing groundwater contaminant plumes. These existing plumes and neighboring contaminant plumes are described in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS. Untreated water from construction site dewatering could contain pollutants that, if discharged to a storm drain system or natural watercourse, could cause the receiving water to exceed water quality standards. Typical pollutants that may be encountered include sediment (the most common pollutant associated with dewatering operations), high levels of pH, and contaminant pollutants associated with current or past use of the Project Site or adjacent land, such as TCE. A release of these pollutants into receiving waters could harm wildlife in San Francisco Bay. Discharging contaminated or sediment-laden water from a dewatering site into any water of the state without treatment is prohibited. The Project would implement Spring 2026 project-specific EIMP (Appendix 2-2) for dewatering activities to prevent the potential for pollutant release.

Groundwater extraction wells, associated conveyance piping, and groundwater monitoring wells are currently operating within the Project Site. This infrastructure could be damaged during construction of the CEQA Proposed Project. Contaminants within the system(s) could be re-released into the environment (in the same location or in other locations of the Project Site).

If groundwater produced during dewatering is discharged to the storm drain system, it would be conveyed to an area contained within berms and dikes and would not flow to San Francisco Bay The NPDES Construction General Permit provides coverage for dewatering activities, provided that

dischargers prove the quality of water to be adequate and not likely to affect beneficial uses. The CEQA Proposed Project would not impact beneficial uses as defined in the Basin Plan.

Other construction activities could result in short-term groundwater quality impacts associated with the input of sediment loads or chemical spills into storm drains or groundwater aquifers that exceed water quality objectives if proper minimization measures are not implemented. However, the proposed project would be required to comply with the MRP, and stormwater and construction site runoff requirements. Requirements include development and implementation of a NPDES Construction General Permit SWPPP, an erosion and sediment control plan, and a stormwater management plan specific to the Project Site to minimize water quality impacts related to spills or other activities that could contaminate groundwater. SWPPPs are approved by the San Francisco Bay Regional Water Board as part of compliance with the NPDES Construction General Permit and permit coverage. BMPs would be required and incorporated into SWPPPs and other permits prior to approval of grading permits, providing an acceptable level of water quality protection. Shallow soils and groundwater would be managed through the Spring 2026 project-specific EIMP. More information on hazardous material requirements is provided in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS. In addition, compliance with the Spring 2026 project-specific EIMP and dewatering regulations would ensure that dewatering activities would be monitored. Water would be treated as required so that violations of water quality standards or waste discharge requirements would not occur. If it is found that the groundwater does not meet water quality standards and applicable water quality objectives (as designated in the Basin Plan) acceptable for discharge, groundwater would be hauled off-site and disposed of at an appropriate waste treatment facility that is permitted to receive such water.

Based on this analysis, construction dewatering activity would have the potential to mobilize existing groundwater contaminant plumes in the area, resulting in a potentially significant impact on groundwater quality before mitigation.

Operation

The Limits of Work are currently covered with a substantial amount of impervious hardscape, including roofs, surface parking lots, streets, and paths. The Project Site is covered with impervious hardscape on approximately 70 percent of the Project Site. The proposed on-site drainage system would consist of two subsystems, Subsystem 1 and Subsystem 2. Implementation of the CEQA Proposed Project would increase the impervious surface area on the Project Site to approximately 79 percent, or a 9 percent increase from existing conditions in Subsystem 1 and 77 percent in System 2. Increases in impervious surface area have the potential to increase runoff rates and associated pollutants. Stormwater runoff may carry pollutants to storm drains and receiving waters, including the San Francisco Bay. Runoff from impervious surfaces can generate nonpoint-source pollutants such as organic materials, solids, pathogens, sediment from erosion, chemical fertilizers, grease, and other pollutants. However, all project-related development would comply with applicable federal, state, and local requirements discussed in Section 3.10.3, *Plans, Policies, and Regulations*, including Provision C.3 and NPDES regulations.

Consistent with Provision C.3 requirements in the MRP, stormwater runoff from the CEQA Proposed Project would be treated prior to discharging to San Francisco Bay. Stormwater treatment areas would be spread throughout the open space. Additional treatment that cannot be accommodated in the open space design would take place within the building parcels using BMP measures, such as green roofs, flow through planters, or pervious material for hardscape within the open space design.

Other potential treatment and low-impact development (LID) options include bioretention areas, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells. Retention would be achieved through one or a combination of methods including retention ponds sized for evapotranspiration and infiltration, on-site water re-use, increasing site permeability (green roofs, additional vegetation, permeable pavement, etc.), or other methods determined during the detailed design phase and based on feasibility and site soil conditions.

Stormwater treatment on the Project Site would include approximately 4 percent of the total proposed impervious area of the Project Site, per SCVURPPP requirements, totaling approximately 53,934 square feet of treatment area. LID methods and other site design features are intended to manage stormwater runoff flows and reduce stormwater pollution from the Project Site. Treatment areas would be spread throughout the proposed open space. These would include bioretention areas along the Promenade and within the Center Point as well as a self-treating lawn area. Treatment areas that cannot be accommodated in the open space design would be placed within building parcels using BMP measures, such as green roofs, flow-through planters, or pervious materials. Street treatment would be provided using flow-through-planters. The Project Site is split into three drainage management areas (DMAs) which are treated via raised and at-grade flow through planters, bioretention areas, and self-treating lawns. Total treatment area for each DMA is shown in Table 3.10-3. Treatment structures would be equipped with high-flow bypasses and used to treat stormwater before it exits the Project Site.[34]

Table 3.10-3. Total Required Treatment Area

Drainage Management Area	Catchment Area (SF)	Impervious Area (SF)	Treatment Area (SF) Required (4% of Impervious Area)
DMA 1	1,016,365	820,663	32,827
DMA 2	504,790	399,633	15,985
DMA 3	152,996	128,048	5,122
Total	**1,674,145**	**1,368,343**	**53,934**

Source: BKF. 2026. *Berkeley Space Center Project, Storm Drain & Stormwater Management Master Plan*. Spring.

Stormwater infrastructure is integrated into the landscape framework through a distributed, decentralized network. Each building plot would have an adjacent treatment area, although a percentage of treatment would also be required within the buildable area as well to meet stormwater requirements. Required stormwater treatment areas would total 53,934 square feet.

The Water Reuse Facility Option would produce recycled water for proposed buildings and irrigated areas. The Water Reuse facility would process all of the CEQA Proposed Project's wastewater to supplement recycled water needs within the Project Site.

Industrial uses adjacent to and within project boundaries have left residual chemicals in the soil and groundwater. However, infiltration on-site, including the potential for on-site landscape irrigation or precipitation to infiltrate to the underlying aquifer or the groundwater plume, is limited due to the low permeability of underlying soils.

[34] BKF. 2026. *Berkeley Space Center Project, Storm Drain & Stormwater Management Master Plan.* Spring.

The integration of landscaping includes phytoremediation strategies, which aid in remediation efforts on-site. Of the 893 new trees, a portion would be used for phytoremediation; the minimum number of phytoremediation trees will be determined by agreements with the EPA. Phytoremediation removes contaminants from soil and groundwater and provides more soil and water enrichment than traditional plantings. By planting a phytoremediation band along Girard Road, the flow of the existing contaminated groundwater plume would be intersected, thereby supporting existing groundwater remediation efforts.

The proposed project would be designed and maintained in accordance with local and San Francisco Bay Regional Water Board requirements, such as the MRP, SCVURPPP, Santa Clara water quality requirements, and the proposed Development Guidelines. The proposed project would comply with the NPDES Construction General Permit; MRP, Provision C.3; and SCVURPPP C.3 stormwater technical guidance, and the Spring 2026 project-specific EIMP (Appendix 2-2). It would also implement a SWPPP and other erosion control measures that incorporate stormwater treatment areas, such as bioretention and stormwater treatment areas. The proposed project would not violate any water quality standards or otherwise result in water quality degradation during operation. Therefore, project impacts on water quality during operation would be less than significant.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce groundwater quality impacts of the CEQA Proposed Project to less than significant. The Spring 2026 project-specific EIMP requires the protection of existing remediation infrastructure, including networks of groundwater monitoring wells and groundwater extraction and conveyance piping. In the event the proposed project needs to move existing groundwater monitoring wells during construction, the Project Proponent would implement the Spring 2026 project-specific EIMP and obtain the appropriate approvals of regulatory agencies. Mitigation Measure HAZ-1 would require the Project Proponent to comply with the Spring 2026 project-specific EIMP. Consistent with the requirements of the Spring 2026 project-specific EIMP, groundwater produced during dewatering from construction activities would be sampled for laboratory analysis to determine appropriate management (on-site dust control, discharge to storm drains, discharge to the sanitary sewer, treatment at the WATS, or offsite disposal), as required by applicable approvals and permitting requirements. Potentially significant impacts on groundwater quality would be reduced by requiring ongoing monitoring and treatment during dewatering activities, and protocols would be implemented that would address potential exposure to impacted groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. The Variant would occur within the same footprint as the CEQA Proposed Project, resulting in a 9 percent increase in impervious cover (same as the CEQA Proposed Project) compared to existing conditions. Consistent with Provision C.3 requirements in the MRP, stormwater runoff from the Variant would be treated prior to discharging to the San Francisco Bay. Potential treatment and LID options would include bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells. LID methods and other site design features are intended to manage stormwater runoff flows and reduce stormwater pollution from the Project Site. Operational impacts would be the same as under the CEQA Proposed Project.

Construction activities under the Variant, including the area of ground-disturbing activities and depth of excavation, would be expected to be the same as under the CEQA Proposed Project. Temporary construction dewatering may be required. Dewatering could result in an exposure to pollutants from spills or the mobilization of existing groundwater contaminant plumes. Construction would comply with dewatering regulations, ensuring that dewatering activities would be monitored and treatment would take place as required so that violations of water quality standards or waste discharge requirements would not occur. However, due to the presence of groundwater contaminant plumes in the area, construction dewatering activities may result in a potentially significant impact on groundwater quality before mitigation. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce impacts to less than significant. Potentially significant impacts on groundwater quality would be reduced by requiring ongoing monitoring and remediation during dewatering activities and that protocols be implemented that would address potential exposure to affected groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. Approximately 70 percent of the Project Site is currently covered by impervious surfaces. The CEQA Reduced Density Alternative would increase the impervious surface area on the Project Site to approximately 79 percent, or a 9 percent increase compared with existing conditions (same as the CEQA Proposed Project).

Consistent with Provision C.3 requirements in the MRP, stormwater runoff would be treated prior to discharging to the San Francisco Bay. Potential treatment and LID options would include bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells. LID methods and other site design features are intended to manage stormwater runoff flows and reduce stormwater pollution from the Project Site. Operational impacts would be the same as under the CEQA Proposed Project.

Construction activities under the CEQA Reduced Density Alternative, including the area of ground-disturbing activities and depth of excavation, would be the same as under the CEQA Proposed Project. Temporary construction dewatering may be required. Dewatering could result in an exposure to pollutants from spills or the mobilization of existing groundwater contaminant plumes. Construction would comply with dewatering regulations, ensuring that dewatering activities would be monitored and treatment would take place as required. However, due to the presence of groundwater contaminant plumes in the area, construction dewatering activities may result in a potentially significant impact on groundwater quality before mitigation. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce impacts to less than significant. Potentially significant impacts on groundwater quality would be reduced by requiring ongoing monitoring and remediation during dewatering activities and that protocols be implemented that would address potential exposure to impacted groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. The Variant would provide flexibility in the proposed project's design and proposed land use and would occur within the same footprint as the CEQA Proposed Project and the CEQA Reduced Density Alternative, resulting in a 9 percent increase in impervious cover compared to existing conditions (same as the CEQA Proposed Project). Consistent with Provision C.3 requirements in the MRP, stormwater runoff from the Variant would be treated prior to discharging to the San Francisco Bay. Potential treatment and LID options would include bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells. LID methods and other site design features are intended to manage stormwater runoff flows and reduce stormwater pollution from the Project Site. The flexibility in the proposed project's design and proposed land use would include additional Research and Office uses instead of Student/Faculty

Housing and additional laboratory and Research & Development uses. However, the proposed land use under the Variant would not affect water quality. Operational impacts would be the same as under the CEQA Proposed Project and CEQA Reduced Density Alternative.

Construction activities under the CEQA Reduced Density Alternative No Student/Faculty Housing Variant, including the area of ground-disturbing activities and depth of excavation, would be the same as under the CEQA Proposed Project and CEQA Reduced Density Alternative. Temporary construction dewatering may be required. Dewatering could result in an exposure to pollutants from spills or the mobilization of existing groundwater contaminant plumes. Construction would comply with dewatering regulations, ensuring that dewatering activities would be monitored and treatment would take place as required. However, due to the presence of groundwater contaminant plumes in the area, construction dewatering activities may result in a potentially significant impact on groundwater quality before mitigation. The potential for the types of impacts would be the same as those analyzed under the CEQA Proposed Project.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance After Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce impacts to less than significant. Potentially significant impacts on groundwater quality would be reduced by requiring ongoing monitoring and remediation during dewatering activities and that protocols be implemented that would address potential exposure to impacted groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

Impact CEQA-HYD-2: Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project could impede sustainable groundwater management of the basin?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

The depth to groundwater on the Project Site ranges from 5 to 12 feet bgs.[35] Maximum excavation depths would extend to 25 feet bgs. The Central Utility Plant Option would require excavation to 11 feet bgs for the distribution pipes, which is more than the excavation needed for the typical utility improvements that would otherwise be required for the CEQA Proposed Project. Temporary construction dewatering may be required in some isolated areas of the Project Site with shallow groundwater. Removal of groundwater resulting from dewatering would not result in a substantial decrease in groundwater supplies. The amount of groundwater potentially requiring dewatering during construction would be minimal relative to the size and volume of groundwater of the Santa Clara subbasin. Groundwater underlying the Project Site is not a source of drinking water. Consistent with the requirements of Mitigation Measure HAZ-1, groundwater produced during dewatering from construction activities would be sampled for laboratory analysis to determine appropriate management (on-site dust control, discharge to storm drains, discharge to the sanitary sewer, treatment at the WATS, or offsite disposal). Determining the groundwater control method during dewatering activities would depend on factors such as the geometry of the excavation, aquifer properties, depth of excavation, and aquifer thickness below the base of the excavation (subgrade). Therefore, construction of the proposed project would not substantially decrease groundwater supplies or impede sustainable groundwater management of the basin. This impact would be less than significant.

Operation

The Project Site is within the Santa Clara Valley Groundwater Basin, Santa Clara subbasin, which is a high-priority basin. Groundwater on the Project Site has been affected through historical use and the migration of contaminated groundwater. Therefore, the untreated groundwater underlying the Project Site cannot be used for drinking water supplies or other beneficial uses. The CEQA Proposed Project would not impact beneficial uses in the subbasin as defined in the Basin Plan. As described in Section 3.18, *Utility and Service Systems*, NASA ARC is served by SFPUC via the Hetch Hetchy Aqueduct, which is generally drawn from surface water supply. Some retail customers are supplied with local groundwater and recycled water supplies. The split between these resources varies from year to year depending on the water year hydrology and operational circumstance. This analysis assumes water supply is predominantly derived from surface water sources. Due to restrictions of groundwater use from aquifer(s) under the Project Site, no direct groundwater pumping for operational water supply is expected.

Implementation of the CEQA Proposed Project would increase the impervious surface area on the Project Site by approximately 9 percent. Increases in impervious surface area could reduce the potential for groundwater recharge. Soils on the Project Site have low permeability due to high clay content, resulting in little to no groundwater recharge. The proposed project would include new landscape buffers, a mix of native and adaptive landscaping, bioretention areas, and stormwater treatment areas throughout the Project Site, in accordance with the Berkeley Space Center Development Guidelines for the NRP. Other potential stormwater treatment and LID options would include flow-through planters, green roofs, rainwater cisterns, media filters, permeable

[35] EKI. 2026. *Environmental Issues Management Plan (EIMP) Berkeley Space Center Premises Parcels 1A, 3, 5A, 5B, and 6A Former NAS Moffett Field, California*. Spring.

pavement/pavers, self-treating landscaped areas, and Silva Cells. These features would treat runoff and capture and naturally filter contaminants from the Project Site's stormwater runoff.

The integration of landscaping also includes phytoremediation strategies, which would aid in existing groundwater remediation efforts on-site. The addition of treatment and LID options would allow groundwater infiltration and groundwater recharge. New landscaped areas would slow surface water runoff, allowing it to percolate into the ground, thereby providing increased benefits from groundwater recharge.

No permanent dewatering systems or groundwater pumping for project operations would be required. Thus, the proposed project would not substantially decrease groundwater supplies and would not impede sustainable groundwater management of the basin. Therefore, this impact would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. Construction activities would be expected to be the same as under the CEQA Proposed Project, including temporary construction dewatering in some isolated areas of the Project Site with shallow groundwater. Groundwater produced during dewatering from construction activities may be used for dust control within the Project Site, consistent with the requirements of the Spring 2026 project-specific EIMP. The Variant would provide flexibility in the proposed project's design and proposed land use and would occur in the same footprint as the CEQA Proposed Project. Implementation of the Variant would increase the impervious surface area on the Project Site by approximately 9 percent (same as the CEQA Proposed Project). Increases in impervious surface area could reduce the potential for groundwater recharge. The proposed project would include new landscape buffers, a mix of native and adaptive landscaping, and stormwater treatment areas throughout the Project Site. Stormwater treatment and LID options would naturally filter contaminants from the Project Site's stormwater runoff and allow groundwater infiltration and groundwater recharge. New landscaped areas would slow surface runoff, allowing it to percolate into the ground, thereby providing increased benefits from groundwater recharge. Impacts would be the same as under the CEQA Proposed Project. Construction and operation of the Variant would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that implementation of the sustainable groundwater management of the basin would be impeded. Impacts associated with the proposed project would be less than significant.

Mitigation Measures

No mitigation is required for this impact

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor

heights would be higher than those under the CEQA Proposed Project. As a result, the CEQA Reduced Density Alternative would increase the impervious surface area on the Project Site by approximately 9 percent compared with existing conditions, the same as the CEQA Proposed Project. Temporary construction dewatering may be required in some isolated areas of the Project Site with shallow groundwater. Groundwater produced during dewatering may be used for dust control within the Project Site, consistent with the requirements of the Spring 2026 project-specific EIMP. The CEQA Reduced Density Alternative would occur within the same footprint as the CEQA Proposed Project. Implementation of the CEQA Reduced Density Alternative would increase the impervious surface area on the Project Site by approximately 9 percent (same as the CEQA Proposed Project). Increases in impervious surface area could reduce the potential for groundwater recharge. The CEQA Reduced Density Alternative would include new landscape buffers, a mix of native and adaptive landscaping, and stormwater treatment areas throughout the Project Site. Stormwater treatment and LID options would naturally filter contaminants from the Project Site's stormwater runoff and allow groundwater infiltration and groundwater recharge. New landscaped areas would slow surface water runoff, allowing it to percolate into the ground, thereby providing increased benefits from groundwater recharge. Impacts would be the same as under the CEQA Proposed Project. Construction and operation of the CEQA Reduced Density Alternative would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the implementation of the sustainable groundwater management of the basin would be impeded. Impacts associated with the proposed project would be less than significant.

Mitigation Measures

No mitigation is required for this impact

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. The same construction activities, including temporary construction dewatering in some isolated areas of the Project Site with shallow groundwater, could be required. Groundwater produced during dewatering may be used for dust control within the Project Site, consistent with the requirements of the Spring 2026 project-specific EIMP. The Variant would provide flexibility in the proposed project's design and proposed land use and would occur within the same footprint as the CEQA Proposed Project. Implementation of the Variant would increase the impervious surface area on the Project Site by approximately 9 percent. Increases in impervious surface area could reduce the potential for groundwater recharge. The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would include new landscape buffers, a mix of native and adaptive landscaping, and stormwater treatment areas throughout the Project Site. Stormwater treatment and LID options would naturally filter contaminants from the Project Site's stormwater runoff and allow groundwater infiltration and groundwater recharge. New landscaped areas would slow surface water runoff, allowing it to percolate into the ground, thereby providing increased benefits from groundwater recharge. Impacts would be the same as under the CEQA Proposed Project and the CEQA Reduced Density Alternative. Construction and operation of the Variant would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that implementation of the sustainable groundwater management of the basin would be impeded. Impacts associated with the proposed project would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

Impact CEQA-HYD-3: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would:

a) ***Result in substantial erosion or siltation on- or off-site,***

b) ***Substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site,***

c) ***Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional source of polluted runoff, or***

d) ***Impede or redirect floodflows?***

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project No Student/Faculty Housing Variant	*Same as CEQA Proposed Project*	—	—
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative No Student/Faculty Housing Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

Construction

During construction, stormwater drainage patterns could be temporarily altered due to site grading, preparation, and excavation. The proposed grading would follow the existing drainage pattern, which flows from south to north. The south-to-north slope pattern would be maintained with a general 0.8 percent slope across the Project Site. The CEQA Proposed Project would result in approximately 45 acres of ground disturbance during construction, inclusive of Project-Site and off-site utility improvements within the Limits of Work. Under the NPDES Construction General Permit, project construction would implement BMPs required in the proposed project SWPPP to minimize the potential for erosion or siltation in nearby storm drains and temporary changes in drainage patterns during construction. During construction, implementation of an erosion and sediment control plan would also be required. Construction BMPs would capture and infiltrate small amounts of sheet flow into the ground so that off-site runoff from the construction site would not increase, ensuring that drainage patterns would not be altered significantly. Measures required by

the NPDES Construction General Permit would also limit site runoff during construction and would not alter stormwater drainage patterns. BMPs would be implemented to control construction site runoff, ensure proper stormwater control and treatment, and reduce the discharge of pollutants to the storm drain system. The proposed project would comply with SCVURPPP requirements, including implementation of construction site control measures and BMPs to prevent sediment from migrating offsite and erosion control measures to stabilize soils, as well as appropriate site design, pollutant source control, and treatment measures to improve and treat runoff. Thus, construction of the proposed project would not substantially alter the existing drainage pattern of the area in a manner that would result in substantial erosion or siltation or increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site. Project construction would not result in an exceedance of drainage system capacities. The associated impact would be less than significant.

Operation

The existing 10-year design peak storm discharge and volume leaving the Project Site is 17.98 cubic feet per second (cfs) and 198,182 cubic feet (cf), respectively. The CEQA Proposed Project would increase the area of impervious cover from 70 percent to approximately 79 percent, or a 9 percent increase from existing conditions. The proposed 10-year design peak storm discharge would be 18.0 cfs, and the peak volume would be 263,338 cf. Stormwater runoff would be treated on-site, and any increase in stormwater volume (estimated to be 65,156 cf) would be retained on-site. Potential treatment and LID options include green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells.[36] In addition, the proposed open space would incorporate bioretention areas along the Promenade within the Central Green and a self-treating lawn area within the center point of the Project Site. Street stormwater runoff would be treated with flow-through planters. LID methods and site design features are intended to manage stormwater runoff flows and reduce stormwater pollution from the Project Site. Untreated stormwater from the center of the Project Site would flow through an overland conveyance to either centralized BMPs or on-site treatment BMPs. Treated stormwater would then be piped underground to the centralized retention facility north of the Project Site. The volume of stormwater retained from the center of the Project Site would meet retention requirements (the equivalent volume of stormwater of the pre-development 10-year storm event) for the remainder of the Project Site. The CEQA Proposed Project would be required to maintain total stormwater flows and not exceed the existing flows and volumes that leave the Project Site, consistent with NPDES stormwater runoff requirements in the MRP. The Project Site would meter flows leaving the site so that the peak discharge would not exceed the existing discharge rate of 17.98 cfs. The proposed stormwater system would contain the 10-year storm discharge in pipes. However, the proposed system would contain the 25-year storm discharge in pipes with surcharging[37] and contain the 100-year storm discharge in curbs without flooding buildings. Because the existing storm drain system north of Project Site is at capacity, the CEQA Proposed Project cannot add additional stormwater flows to this system during peak rainfall events. Therefore, the CEQA Proposed Project would not add any additional stormwater to the existing storm drain system north of the Project Site.

[36] *Silva Cells* are suspended pavement systems that prevent soil compaction around tree roots, allowing trees to grow freely without buckling sidewalks; stormwater is treated on-site.

[37] Surcharging occurs when the flow discharging through a pipe exceeds the maximum capacity of the pipe, thereby backing up in the system. When surcharging occurs, it seeks to relieve itself at the lowest relief point on the system.

The proposed on-site drainage system would consist of two subsystems conveying runoff and discharging into a new trunk main to eastern diked marsh. Subsystem 1 would cover approximately 23.3 acres and drain via pipes on the interior of the Project Site to the on-site retention system. The proposed storm drain line for Subsystem 1 would connect to the proposed storm drain retention system located in the northeast corner of the Project Site to retain the entire increase in volume from the existing site. The retention pond would slow the flow of stormwater into the eastern diked marsh in the event of a large storm event. The remainder of stormwater flows would discharge to the proposed dedicated trunk main to Eastern Dike Marsh in Cody Road. The proposed stormwater system is shown in Figure 2-19a, Conceptual Utilities Plan (Stormwater), and Figure 2-19b, Conceptual Utilities Plan (Stormwater – Eastern Diked Marsh Trunk Main), in Chapter 2, *Proposed Project/Proposed Action and Alternatives*. Flows would be metered upstream of the connection to the trunk main so that flows would be released at a controlled flow rate and not exceed the flow rate of the existing site. Subsystem 2 would cover approximately 11.6 acres that drain via pipes in Girard Road, Wescoat Road, and Cody Road. Subsystem 2 would convey runoff to the proposed trunk main in Cody Road and discharge to the eastern diked marsh. Subsystem 2 would not have any flow and volume reduction as all flow and volume for the entire site would be handled in Subsystem 1. New drainage systems would also be installed in both Wescoat Road and Cody Road and connect to the existing NASA storm drain system, similar to existing conditions. Stormwater treatment BMPs would be implemented to manage the flow rate and volume from both roads, which would be equivalent to existing conditions, and no additional detention or retention would be required.[38]

The off-site storm drain system would consist of a 48-inch trunk main. The trunk main would be sized to convey flows from the Project Site and ultimately connect directly to the eastern diked marsh. As part of the proposed project, swale and rap would be installed at the eastern diked marsh outfall, which would prevent erosion.

During the 10-year design storm, storm flows would be reduced to the pre-project peak flow via an orifice at the outlet of subsystem 1, which would account for flow reduction of the entire site. Flows in the 10-year design storm would be contained completely below the ground surface. Impacts to the eastern diked marsh would be reduced by retaining storm flows on-site and discharging a volume equivalent to the existing 10-year volume from the Project Site. Given the known flooding issues north of the Project Site, as described in Section 3.10.2.2, *Project Site*, the CEQA Proposed Project would detain and retain flows and volumes to match existing flows and volumes leaving the Project Site, as required by the MRP. Flow and volume would be verified during the detailed project design phase. The proposed project would ultimately discharge a volume equivalent to the existing volume leaving the Project Site and would decrease the volume discharged to the NASA Ames storm drain system as it redirects stormwater directly to the marsh via the new trunk main, alleviating any potential flooding issues in the NASA Ames storm drain system.

Detention would be provided to reduce the peak discharge rate. Runoff would be detained onsite in oversized pipes upstream of the connection to the eastern diked marsh trunk main. Flows would ultimately flow into the off-site trunk main on Cody Road at a controlled flow rate via an outfall. An orifice and weir would meter flows leaving the Project Site to match the existing flow rate. Other potential options for detention include a detention vault, an array of pipes reserved for detention, or oversized pipes.

[38] BKF. 2026. *Berkeley Space Center Project, Storm Drain & Stormwater Management Master Plan.* Spring.

To manage the excess volume of runoff discharged from the Project Site (i.e., 65,156 cf), the proposed project would also include retention. Stormwater retention strategies would improve downstream conditions by slowing runoff flows during peak storm events. The project proposes to retain the equivalent volume of water of the pre-development 10-year storm event. Retention would be achieved through one or a combination of methods including a retention pond, on-site water re-use, increasing site permeability (e.g., green roofs, additional vegetation, permeable pavement), or other methods. Retention areas are proposed at the northern portion of the Project Site. The retention ponds are designed to hold the difference between the 10-year existing volume and the 10-year proposed volume.[39]

New drainage systems would be installed in both Wescoat Road and Cody Road and would connect to the existing NASA storm drain system in Cummins Avenue, similar to existing conditions. Both Wescoat Road and Cody Road sections would be replaced essentially in kind, and the existing drainage patterns of each road would be maintained. Stormwater flows would be managed via stormwater treatment BMPs. Drainage patterns on Wescoat Road and Cody Road are not expected to change. Therefore, the flow rate and volume from both roads are assumed to be equivalent to existing and no additional detention or retention will be required. The CEQA Proposed Project may temporarily connect to the existing NASA storm drain system north of the Project Site, which is at capacity. For any duration of time that the CEQA Proposed Project temporarily connects to the existing NASA system, the 10-year post-project peak discharge would not exceed the pre-project 10-year peak discharge for the entire Project Site because runoff would be managed with stormwater BMPs.[40]

Storm runoff would be captured and treated on-site using LID methods such as bioretention areas, flow-through planters, permeable pavement/pavers, and self-treating landscaped areas, per current NPDES Provision C.3 requirements. Consistent with Provision C.3 requirements, stormwater runoff from the CEQA Proposed Project would be treated prior to discharging to the storm drain, which ultimately flows to San Francisco Bay. Off-site utility improvements would also comply with Provision C.3 requirements in the MRP and local stormwater requirements. All project-related development would comply with applicable federal, state, and select local requirements, as discussed in Section 3.10.3, *Plans, Policies, and Regulations*, including requirements regarding water quality, flood control, and stormwater management. Given the analysis above, the CEQA Proposed Project would not add any additional stormwater to the existing storm drain system north of the Project Site. The CEQA Proposed Project would not alter existing drainage patterns or change stormwater runoff rates or volumes at the Project Site in a manner that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Furthermore, floodflows would not be impeded or redirected. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

[39] BKF. 2026. *Berkeley Space Center Project, Storm Drain & Stormwater Management Master Plan.* Spring.

[40] Ibid.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. The construction activities expected, including grading and temporary ground disturbance, would be the same as under the CEQA Proposed Project. As required by the NPDES Construction General Permit, standard erosion control measures and BMPs identified in the proposed project SWPPP would be implemented during construction to reduce erosion or siltation on- or off-site.

The Variant would provide flexibility in the proposed project's design and proposed land use and would occur within the same footprint as the CEQA Proposed Project. Implementation of the Variant would increase the impervious surface area on the Project Site by approximately 9 percent (same as the CEQA Proposed Project). Increases in impervious surface area could result in increases in stormwater runoff and associated pollutants. Stormwater runoff would be treated on-site, and any increases in stormwater volumes would be retained on-site. Potential treatment and LID options include bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells. Treated stormwater would then be piped underground to the centralized retention facility north of the Project Site.

The existing 10-year design peak storm discharge leaving the Project Site is 17.98 cfs. The proposed 10-year design peak storm discharge for the Project Site would not exceed 18.0 cfs according to the proposed Master Plan. The Project Site is required to maintain stormwater flows by not exceeding existing flows and volumes, consistent with NPDES stormwater runoff requirements in the MRP. Runoff leaving the Project Site would be metered so that the peak discharge would not exceed the existing discharge rate. The proposed stormwater system for the Variant would be the same as under the CEQA Proposed Project. Given the known flooding issues north of the Project Site, the Variant would be required to detain and retain flows and volumes to match existing flows and volumes leaving the Project Site. In addition, a retention pond would be incorporated into the site design to manage the increase in runoff volumes. The Variant would comply with Provision C.3 requirements in the MRP and local stormwater requirements. Impacts would be the same as under the CEQA Proposed Project. Construction and operation of the Variant would not alter existing drainage patterns or change stormwater runoff rates or volumes at the Project Site in a manner that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Furthermore, floodflows would not be impeded or redirected. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. The same construction activities would be expected, including grading and temporary ground disturbance. As required by the NPDES Construction General Permit, standard erosion control measures and BMPs identified in

the SWPPP would be implemented to reduce erosion or siltation. Approximately 70 percent of the Project Site is currently covered by impervious surfaces. The CEQA Reduced Density Alternative would increase the impervious surface area on the Project Site from approximately 70 percent to approximately 79 percent, or a 9 percent increase compared with existing conditions (same as the CEQA Proposed Project). Consistent with Provision C.3 requirements in the MRP, stormwater runoff would be treated prior to discharging to the San Francisco Bay. Potential treatment and LID options include bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells. LID methods and other site design features are intended to manage stormwater runoff flows and reduce stormwater pollution from the Project Site. Treated stormwater would then be piped underground to the centralized retention facility north of the Project Site. Any increases in stormwater volumes would be retained on-site.

The proposed stormwater system for the CEQA Reduced Density Alternative would be same as under the CEQA Proposed Project. The proposed on-site drainage system would consist of two subsystems: Subsystem 1 and Subsystem 2. Subsystem 1, on the interior of the Project Site, would connect to the proposed storm drain retention system located in the northeast corner of the Project Site and discharge to the retention pond. The retention pond would slow the flow of stormwater into the eastern diked marsh in the event of a large storm event. Subsystem 2 would convey runoff to the proposed trunk main in Cody Road and discharge to the eastern diked marsh. Subsystem 2 would not have any flow and volume reduction as all flow and volume for the entire site would be handled in Subsystem 1. The Project Site is required to maintain total stormwater flows and not exceed existing flows and volumes that leave the Project Site. The proposed 10-year design peak storm discharge would not exceed 18.0 cfs according to the proposed Master Plan. The Project Site would meter flows leaving the site so that the peak discharge would not exceed the existing discharge rate of 17.98 cfs. Runoff volumes would match existing flow rates and volumes leaving the Project Site. In addition, a retention pond would be incorporated into the site design to manage the increase in runoff volumes. The CEQA Reduced Density Alternative would comply with Provision C.3 requirements in the MRP and local stormwater requirements. Impacts would be the same as under the CEQA Proposed Project. Construction and operation of the CEQA Reduced Density Alternative would not alter existing drainage patterns or change stormwater runoff rates or volumes at the Project Site in a manner that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Furthermore, floodflows would not be impeded or redirected. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. The Variant would provide flexibility in the proposed project's design and proposed land use and would occur within the same footprint as the CEQA Proposed Project and the CEQA Reduced Density Alternative, resulting in a 9 percent increase in impervious cover compared to existing conditions (same as the CEQA Proposed Project). Construction of the CEQA Reduced Density Alternative No Student/Faculty Housing Variant is expected to include the same construction activities, including grading and temporary ground

disturbance. Standard erosion control measures and BMPs identified in the SWPPP would be implemented to reduce erosion or siltation, as required by the NPDES Construction General Permit.

Consistent with Provision C.3 requirements in the MRP, stormwater runoff would be treated prior to discharging to the San Francisco Bay. Potential treatment and LID options include bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells. LID methods and other site design features are intended to manage stormwater runoff flows and reduce stormwater pollution from the Project Site. Treated stormwater would then be piped underground to the centralized retention facility north of the Project Site.

The proposed stormwater system for the CEQA Reduced Density Alternative No Student/Faculty Housing Variant would be same as under the CEQA Proposed Project and the CEQA Reduced Density Alternative. The Project Site is required to maintain total stormwater flows by not exceeding existing flows and volumes that leave the Project Site. The proposed 10-year design peak storm discharge would not exceed 18.0 cfs according to the proposed Master Plan. The Project Site would meter flows leaving the site so that the peak discharge would not exceed the existing discharge rate of 17.98 cfs. A retention pond would also be incorporated into the site design to manage the increase in runoff volumes. The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would comply with Provision C.3 requirements in the MRP and local stormwater requirements. Impacts would be the same as under the CEQA Proposed Project and the CEQA Reduced Density Alternative. Construction and operation of the CEQA Reduced Density Alternative No Student/Faculty Housing Variant would not alter existing drainage patterns or change stormwater runoff rates or volumes at the Project Site in a manner that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. Furthermore, floodflows would not be impeded or redirected. Impacts would be less than significant.

Mitigation Measures

No mitigation is required for this impact.

Impact CEQA-HYD-4: *Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan*?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Potentially Significant	HAZ-1. Implement the Environmental Issues Management Plan	Less than Significant with Mitigation
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*	*Same as CEQA Proposed Project*
CEQA Reduced Density Alternative	Potentially Significant	Same as CEQA Proposed Project	Less than Significant with Mitigation
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	*Same as CEQA Proposed Project*	*Same as CEQA Reduced Density Alternative*

CEQA Proposed Project (NEPA Build Alternative 1)

Commonly practiced BMPs would be implemented to control construction site runoff and reduce the discharge of pollutants to storm drain systems from stormwater and other nonpoint-source runoff. As part of compliance with permit requirements during ground-disturbing or other construction activities, water quality control measures and BMPs would be implemented, ensuring that water quality standards would be achieved, including water quality objectives that protect designated beneficial uses of surface water and groundwater, as defined in the Basin Plan. Construction runoff would also have to be in compliance with the appropriate water quality objectives for the region. The NPDES Construction General Permit requires stormwater discharges to not contain pollutants that cause or contribute to an exceedance of applicable water quality objectives or water quality standards, including designated beneficial uses. As stated in Impact CEQA-HYD-1, incorporation of a variety of stormwater treatment methods, including bioretention areas, flow-through planters, green roofs, a retention pond, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells, would reduce stormwater runoff flows and associated pollutants. The Water Reuse Facility Option would produce recycled water to serve the proposed buildings, including irrigated areas. Irrigated areas would also reduce stormwater runoff flows and associated pollutants through infiltration.

Dewatering would be conducted on a temporary basis during the construction phase. Groundwater would not be used during operation. Although the amount of impervious surface area within the Project Site would increase upon project completion, stormwater treatment areas and gardens, bioretention planters, and landscape designs with integrated stormwater management, including phytoremediation, would be used to treat runoff and allow groundwater infiltration and groundwater recharge. Implementation of stormwater management and treatment features would provide areas for infiltration, allow groundwater recharge, and protect groundwater resources, as required by the sustainable groundwater management plan.

The Project Site overlies the Santa Clara Valley Groundwater Basin, Santa Clara subbasin, which is designated as a high-priority basin and subject to the Sustainable Groundwater Management Act (SGMA). The groundwater management plan for the for the Santa Clara and Llagas subbasins is the applicable sustainable groundwater management plan for the Project Site. Thus, construction and operation of the proposed project would not conflict with or obstruct implementation of a sustainable groundwater management plan.

Regarding groundwater quality, construction dewatering could be conducted on a temporary basis. The proposed project could result in water quality impacts due to the discharge of potentially contaminated dewatered groundwater into surface waters or migration of the regional contaminated groundwater plume, as described under Impact CEQA-HYD-1. Water quality standards and water quality objectives that protect designated beneficial uses of surface and groundwater, as defined in the Basin Plan, may be adversely impacted. Construction dewatering would have the potential to mobilize existing groundwater contaminant plumes in the area, and could conflict with or obstruct implementation of a water quality control plan, resulting in a potentially significant impact before mitigation

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance After Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce impacts to less than significant. Potentially significant impacts on water quality would be reduced by requiring ongoing monitoring and remediation during groundwater dewatering activities and that protocols be implemented that would address potential exposure or migration of impacted groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

CEQA Proposed Project No Student/Faculty Housing Variant (NEPA Build Alternative 1 No Student/Faculty Housing Sub-Alternative)

The CEQA Proposed Project No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. Construction activities, including ground-disturbing activities, would be expected to be the same as under the CEQA Proposed Project. The Variant would provide flexibility in the proposed project's design and proposed land use and would occur within the same footprint as the CEQA Proposed Project. Potential impacts would be the same as under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce impacts to less than significant. Potentially significant impacts on groundwater quality would be reduced by requiring ongoing monitoring and remediation during dewatering activities and that protocols be implemented that would address potential exposure to impacted groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

CEQA Reduced Density Alternative (NEPA Build Alternative 2)

The CEQA Reduced Density Alternative would result in the same types of land uses at the same locations. The maximum building height would also be the same, but the internal floor-to-floor heights would be higher than those under the CEQA Proposed Project. As a result, the CEQA Reduced Density Alternative would increase the impervious surface area on the Project Site by approximately 9 percent compared with existing conditions, the same as the CEQA Proposed Project. Implementation of BMPs, as required by the Construction General Permit, would control construction site runoff and ensure that water quality standards would be achieved, including water quality objectives that protect designated beneficial uses of surface water and groundwater, as

defined in the Basin Plan. As stated in Impact CEQA-HYD-1, incorporation of a variety of stormwater treatment methods, including bioretention areas, flow-through planters, green roofs, a retention pond, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells, would also reduce stormwater runoff flows and associated pollutants.

Dewatering would be conducted on a temporary basis during the construction phase. Implementation of stormwater management and treatment features would provide areas for infiltration, allow groundwater recharge, and protect groundwater resources, as required by the sustainable groundwater management plan. Potential impacts would be the same as under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce impacts to less than significant. Potentially significant impacts on groundwater quality would be reduced by requiring ongoing monitoring and remediation during dewatering activities and that protocols be implemented that would address potential exposure to impacted groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

CEQA Reduced Density Alternative No Student/Faculty Housing Variant (NEPA Build Alternative 2 No Student/Faculty Housing Sub-Alternative)

The CEQA Reduced Density Alternative No Student/Faculty Housing Variant would not change the basic characteristics of the CEQA Proposed Project. Construction activities, including ground-disturbing activities, would be expected to be the same as those under the CEQA Proposed Project and CEQA Reduced Density Alternative. The Variant would provide flexibility in the proposed project's design and proposed land use and would occur within the same footprint as the CEQA Proposed Project and the CEQA Reduced Density Alternative. Potential impacts would be the same as those under the CEQA Proposed Project and would be potentially significant before mitigation.

Mitigation Measures

The following mitigation measure(s) are required:

Mitigation Measure HAZ-1. Implement the Environmental Issues Management Plan

See discussion for the CEQA Proposed Project under Impact CEQA-HAZ-1 in Section 3.9, Haz*ards and Hazardous Materials*, of this joint EIR/EIS.

Significance after Mitigation

Implementation of Mitigation Measure HAZ-1 would reduce impacts to less than significant. Potentially significant impacts on groundwater quality would be reduced by requiring ongoing monitoring and remediation during dewatering activities and that protocols be implemented that would address potential exposure to impacted groundwater resulting from project implementation. Impacts on groundwater quality during construction would be less than significant with mitigation.

3.10.9 Cumulative Impacts

Cumulative impacts are addressed only for those thresholds that would result in a project-related impact. If the proposed project would result in no impact with respect to a particular threshold, it would not contribute to a cumulative impact. As discussed in Section 3.10.7, *Impacts Not Evaluated in Detail*, the proposed project would result in no impact related to the release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones, and no cumulative analysis is required. The discussion of cumulative impacts addresses the topics evaluated in the corresponding project impacts in Section 3.10.8, *Impacts and Mitigation Measures*, above.

The cumulative projects within NASA ARC are described in Section 3.6, *Approach to Cumulative Impact Analysis*, in Chapter 3, *Affected Environment/Environmental Setting and Environmental Impacts*, and shown in Figure 3.1-1. The cumulative geographic context for surface water hydrology and water quality is the Saratoga Creek-Frontal San Francisco Bay Estuaries Watershed (195 square miles) of the larger San Francisco Bay Basin Watershed. The cumulative geographic context for groundwater hydrology and water quality is the Santa Clara Valley Groundwater Basin, Santa Clara subbasin (240 square miles). Given the size of each cumulative geographic context, it is beyond the scope of this joint EIR/EIS to identify every cumulative project within its boundaries.

Impact CEQA-C-HYD-1: Would the project result in a cumulatively considerable contribution to a significant environmental impact with respect to hydrology and water quality? (Less than Cumulatively Considerable with Mitigation)

Water Quality

Generally, cumulative projects would occur in developed areas with existing impervious surfaces and would not be expected to substantially increase the amount of new impervious surface area. The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would result in a net increase in impervious surface area. In addition, temporary construction dewatering may be required in some isolated areas of the Project Site with shallow groundwater. Dewatering could result in an exposure to pollutants from spills or other activities and may contaminate groundwater. Untreated water from construction site dewatering could contain pollutants that, if discharged to a storm drain system or natural watercourse, could cause the receiving water to exceed water quality standards. Therefore, the impacts of the cumulative projects, combined with the proposed project, would result in a significant cumulative impact related to water quality without mitigation.

Cumulative projects would be required to adhere to applicable City of Santa Clara General Plan goals, policies, and action statements; the City's Municipal Zoning Code; and the City's stormwater management guidelines regarding stormwater runoff and infrastructure. In addition, cumulative projects would be required to implement stormwater pollution BMPs during construction and incorporate LID design measures to reduce water quality impacts and comply with the NPDES MRP.

The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) proposes bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells to treat and manage stormwater runoff before it enters the stormwater system. The proposed project would comply with NPDES stormwater runoff and Provision C.3 requirements in the MRP. The stormwater management measures proposed for the proposed project would reduce pollutant discharges from stormwater through filtration and infiltration.

Implementation of Mitigation Measure HAZ-1 requires compliance with the Spring 2026 project-specific EIMP, which would protect human health and the environment. Consistent with the requirements of the Spring 2026 project-specific EIMP, groundwater produced during dewatering from construction activities would be sampled for laboratory analysis to determine appropriate management (on-site dust control, discharge to storm drains, discharge to the sanitary sewer, treatment at the WATS, or offsite disposal). Therefore, the CEQA Proposed Project (with and without the Variant) and CEQA Reduced Density Alternative (with and without the Variant) would not result in a cumulatively considerable contribution to significant environmental impacts on water quality after mitigation.

Groundwater Recharge and Supplies

During construction of cumulative projects within the Santa Clara Valley Groundwater Basin, Santa Clara subbasin, dewatering could be conducted on a one-time or temporary basis during the construction phase, but would not likely result in a loss of water that would deplete groundwater supplies. In addition, buildout of the cumulative projects would generally involve redevelopment of existing developed sites that contain substantial areas with impervious surfaces, which would not substantially change the size of groundwater recharge areas. The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) may require temporary construction dewatering in some isolated areas of the Project Site to address the effects of shallow groundwater. In addition, the proposed project would result in a net increase in impervious surface area. However, no permanent dewatering systems or groundwater pumping for project operations would be required. The proposed project would not substantially decrease groundwater supplies and would not impede sustainable groundwater management of the basin. Therefore, the impacts of the cumulative projects, combined with the proposed project, would not result in a significant cumulative impact related to groundwater recharge and supplies.

Storm Drain Capacity

Cumulative projects in the vicinity of the Project Site could increase the volume and rate of stormwater runoff. Such increases could cause localized flooding if storm drainage capacity is exceeded or excess flows overtop banks in areas where floodwater storage may not be available. Generally, cumulative projects would occur in developed areas with existing impervious surfaces and would not be expected to substantially increase the amount of new impervious surface area. The CEQA Proposed Project (with and without the Variant) and the CEQA Reduced Density Alternative (with and without the Variant) would result in a net increase in impervious surface area. However, the project proposes bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, constructed wetlands, and Silva Cells to treat and manage stormwater runoff before it enters the stormwater system. In addition, a retention pond would be incorporated into the site design to manage any increase in

runoff volumes. The Project Site would meter flows leaving the site so that the peak discharge would not exceed the existing discharge rate. Runoff flows are required to be detained and retained. Volumes would match the existing flow rates and volumes leaving the Project Site; the proposed project would comply with Provision C.3 requirements in the MRP. Therefore, because cumulative projects would generally occur in developed areas, the impacts of the cumulative projects, combined with the proposed project, would not result in a significant cumulative impact related to storm drain capacity.

3.11 Land Use and Planning

3.11.1 Introduction

This section evaluates the potential impacts on land use and planning that could result from construction and operation of the Berkeley Space Center at NASA Research Park (proposed project/proposed action). This section also describes existing conditions at the Project Site as well as the regulatory framework for this analysis.

Issues identified in response to the Notice of Preparation (NOP) and Notice of Intent (NOI) (Appendix 1-1, *Scoping Report*) were considered in preparing this analysis. The NOP/NOI comments pertaining to land use and planning include a request by the County of Santa Clara to describe local land use jurisdictional issues and identify which federal, state and/or local plans would apply to the proposed project. This issue is addressed below in Section 3.11.3, *Plans, Policies, and Regulations.*

3.11.2 Affected Environment/Environmental Setting

3.11.2.1 Regional Setting

The Project Site is on federal land within the National Aeronautics and Space Administration Ames Research Center (NASA ARC), an approximately 2,000-acre facility located between U.S. 101 and the southwestern edge of San Francisco Bay, as shown in Figure 2-1, Project Location, in Chapter 2, *Proposed Project/Proposed Action and Alternatives*. NASA ARC is composed of the original NASA ARC campus, Moffett Federal Airfield, airfield support facilities, barracks, support facilities for current and former military personnel, and open space. The city of Mountain View borders NASA ARC to the north and southwest; the city of Sunnyvale borders NASA ARC to the southeast and east. NASA ARC is approximately 33 miles south of the city of San Francisco and 8 miles north of the city of San José.

3.11.2.2 Adjacent Uses

The immediate vicinity of the Project Site comprises a mix of uses. Northwest of the Project Site, across Wescoat Road, is Shenandoah Plaza, a linear open space surrounded by two-story, Mission-style buildings clustered in a formal campus-like layout defined by a west-facing gated entrance and landscape that includes mature trees, shrubs, and manicured lawns. Northeast of the Project Site, across from the intersection of Wescoat Road and Cody Road, is Hangar One, one of the largest freestanding structures in the world. Hangar One and many of the buildings, landscapes, and objects north of the Project Site are within the boundaries of the Shenandoah Plaza. Also north of the Project Site is the Moffett Field Museum, which includes aviation, space flight, and national defense exhibits. East of the Project Site, across Cody Road, is Moffett Federal Airfield. An area designed as a preserve providing burrowing owl habitat is located between Moffett Federal Airfield and lands east of Cody Road; a small portion of the burrowing owl preserve overlaps the southeastern portion of the Project Site.

Moffett Federal Airfield is owned by NASA and currently used by NASA, with some limited use by other resident agencies and tenants. East of Moffett Federal Airfield is the city of Sunnyvale and large office/research-and-development (R&D) campuses that are occupied by Google, Amazon,

Lockheed Martin, and Meta. Beyond the southern border of the Project Site, along Girard Road and within the NRP, is a recreational field and facilities previously used to support Naval operations; farther south is U.S. 101 and the city of Mountain View. West of the Project Site is Wescoat Village at Moffett Field, an area managed by the U.S. Army that comprises multi-family and single-family residences. North the Project Site, beyond Shenandoah Plaza, is NASA ARC, which includes the world's largest wind tunnels, among other highly specialized R&D facilities. Farther northwest of the Project Site are additional large office/R&D Google facilities, both on NASA land and within the city of Mountain View.

The NASA Ames Development Plan (NADP), as discussed in more detail below, is a comprehensive long-range land use plan that has guided the use, renovation, management, and development of facilities at the approximately 2,000-acre NASA ARC. Four planning areas are identified within the NADP; the Project Site is within the NRP planning area. The NRP covers approximately 86 acres in the southwestern portion of NASA ARC. It is bordered by the Eastside/Airfield planning area, the NASA ARC planning area, military housing operated by a private developer on behalf of the Department of War, and U.S. 101. Under the NADP, allowed development within the NRP planning area includes laboratories, office space, classrooms, auditoriums, museums, a conference center, open space, a burrowing owl preserve, parking, housing, and limited retail facilities.

3.11.2.3 Limits of Work

The Limits of Work are located primarily on federal land within NASA ARC. A small portion of the Off-Site Areas is on federal land owned by the United States Army (Army). The Project Site is within the City of Mountain View Sphere of Influence but outside of any city's jurisdictional limits. Most of the Off-Site Areas are also within the City of Mountain View Sphere of Influence and outside of any city's jurisdictional limits, with the exception of the northern portion and the southwestern portion, which are within the city of Mountain View. The Project Site is a portion of Santa Clara County Assessor's Parcel Number 116-18-012.

The Limits of Work are currently developed with 18 one- to three-story buildings that total approximately 185,600 square feet (including approximately 132,500 square feet of vacant uses and approximately 53,100 square feet of occupied uses), along with surface parking lots, roadways, and utility infrastructure. The existing site is shown in Figure 2-4, Existing Conditions Site Plan (Limits of Work) in Chapter 2, *Proposed Project/Proposed Action and Alternatives*. Table 2-1 in Chapter 2 summarizes the condition of the existing buildings within the Limits of Work. The existing buildings are mostly vacant; many were formerly used as ancillary buildings that supported Navy operations (e.g., offices, food service, a gas station, pool, recreation center, and lodging). The other existing buildings within the Limits of Work comprise industrial, storage, and utility facilities. The buildings range in height from approximately 15 to 45 feet above the finished grade. In addition, there are approximately 900 existing parking spaces within the Limits of Work. As of mid-2024, approximately 42 people were employed within the Limits of Work; no full-time residents or short-term occupants (e.g., summer interns) lived within the Limits of Work.

Land Use Designation and Zoning

Within the NRP planning area, the Project Site has been designated and conceptualized as University Reserve. The University Reserve designation category is intended for educational facilities and could include uses such as classrooms, offices, lecture halls, research facilities, and the ancillary facilities required to achieve NASA's mission related to education and outreach. The Project Site is located

within the NRP planning area on parcels designated for educational and research and development/office facilities. The NADP used floor area ratios (FARs) to identify preferred densities at the time it was prepared, but the FARs are not regulatory requirements. Thus, there is no minimum or maximum FAR applicable to the Project Site and the developable area established by the Project Proponent's Enhanced Use Lease applies to the Project Site.

3.11.3 Plans, Policies, and Regulations

UC Berkeley is constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. As such, UC Berkeley will not consider local policies and regulations in its evaluation of the environmental effects of the proposed project unless UC Berkeley expressly decides to use a local policy or regulation as a threshold or standard of significance.

Most of NASA ARC, including the area where the proposed action would be built and operated, is an area of exclusive federal jurisdiction. In the absence of an explicit waiver of sovereign immunity by Congress, State and local government regulations (e.g., city and county general plans, land use policies, zoning regulations, and State environmental laws) do not apply to areas of exclusive federal jurisdiction. Therefore, State and local government requirements, as applicable to the proposed action, will not be considered, at least to the extent for a proposed action and environmental effects on NASA ARC jurisdictional property. This includes mitigation measures proposed in accordance with those State and local government regulations that are not applicable in areas of federal jurisdiction; such proposed mitigation measures are optional on the part of NASA. However, NASA may, at its discretion, expressly apply a state or local requirement for purposes of establishing a threshold or standard of significance and may elect to apply mitigation measures established by state or local governmental agencies.

This section summarizes plans, policies, and regulations considered in the analysis.

3.11.3.1 Federal Regulations

Executive Order 13148

Executive Order (EO) 13148 mandates that environmental management considerations must be a fundamental and integral component of federal government policies, operations, planning, and management. The primary goal of this EO in the natural resources arena is for each agency to strive to promote the sustainable management of federal facility lands through the implementation of cost-effective, environmentally sound landscaping practices and programs to reduce adverse impacts on the natural environment.

NASA Cultural Resources Management Program

NASA's management of cultural resources and support its Integrated Cultural Resources Management Plan (ICRTMP). The ICRTMP, established in 2014 for NASA ARC, serves as an internal compliance and management tool to integrate the NASA Cultural Resources Management Program with the mission activities at ARC, ensuring that cultural resource considerations are incorporated into project planning and execution.

Ames Research Center Directives

The Ames Policy Directives (APDs) and Ames Procedural Requirements (APRs)[1] are a public listing of NASA ARC policies and procedures. These publicly available policies describe compliance with NASA's standards and contain the framework for how NASA ARC carries out the review, assessment, and approval of projects at NASA ARC. The policies also address NASA ARC's conformance with federal, state, and local land use plans and regulations. The following APDs and APRs would be applicable to the Project Site:

- **APD 8500.1: Ames Environmental Policy.** Demonstrates pollution prevention practices and continual improvement of NASA ARC's environmental program. The Environmental Management Division is responsible for establishing and overseeing the following programs to ensure compliance with applicable laws and NASA's policy: drinking water, industrial wastewater, spill prevention control and countermeasures, air quality, stormwater, hazardous materials, hazardous waste, restoration, National Environmental Policy Act (NEPA), natural resources, and sustainability.
- **APD 8829.1: Construction Permits.** Establishes the Ames-specific policies and responsibilities for construction activities. The policy of NASA ARC is that all construction work is to be reviewed in adherence to all appropriate and applicable building and construction codes and standards. This review shall be performed according to a construction permit process established for the request, review, and approval of all construction permits at NASA ARC.
- **APD 8835.1: Landscaping Planting and Grooming.** Establishes policies for NASA ARC grounds and landscaping.
- **APR 8822.1: NASA Research Park Design Review Program.** Establishes Ames-specific responsibilities and procedures for the Design Review Program for all tenant-proposed development projects within the jurisdiction of NASA ARC. Upon completion of the NEPA process, the specifics regarding each building's architectural design and configuration within the Project Site will be reviewed for conformance and approval through NASA's NRP Design Review Board process (pursuant to Ames Procedural Requirement [APR] 8822.1). The Design Review Program is typically a two-stage process: Pre-Conceptual Design Review (to adequately define the scope of a project, to determine the level of environmental review needed for site approval, and to ensure that an applicant conforms to applicable requirements) and Preliminary Design Review (which includes submission for the Concept Design Phase [CDP]). The NEPA process would address the purpose of the Pre-Conceptual Design Review stage; thus, the need for a Pre-Conceptual Design submission for the proposed project may be waived. During the Preliminary Design Review stage, NASA will assess whether the design and configuration of the proposed project complies with the NADP and Project Site-specific NEPA documents, including the Maximum and Minimum Development Parameters and Standards, as documented in the Record of Decision (ROD). Overall project approval consistent with the procedures outlined in APR 8829.1 is required before NASA will issue any permits for construction for the proposed project. Design review ensures that development projects are properly coordinated and that they comply with NEPA and the National Historic Preservation Act (NHPA).

[1] National Aeronautics and Space Administration. 2024. *Ames Research Center Directives*. Available: https://www.nasa.gov/ames-research-center-directives/. Accessed: November 18, 2025.

- **APR 8829.1: Construction Permit Process.** Establishes the construction permit process and the requirements imposed on all construction activities at NASA ARC. APR 8829.1 establishes minimum requirements to provide a reasonable level of safety, public health, and general welfare through structural strength, means of egress facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire, explosion, and other hazards and provide a reasonable level of safety to fire and emergency responders during emergency operations. For NRP projects, the Project Proponent must first engage in the NRP design review process (described above) and obtain approval from the NRP design review board before approval of a construction permit. These planning review and approval procedures ensure consistency with Ames master planning and compatibility with other planned work as well as the project definition and readiness.

NASA Ames Development Plan

The NASA Ames Development Plan (NADP) is the long-term master plan for NASA's federal campus at Moffett Field published in 2002. The NADP details transformation of the original 500-acre campus of ARC and 1,500 acres of the former Naval Air Station Moffett Field into an integrated, dynamic research and education community. The transformation was led by the establishment of the NRP, a research-and-development campus for partners from academia, industry, and non-profit organizations with shared goals in support of NASA's mission.

The plan is broken down into various planning and development districts and includes a description of land use, infrastructure, facilities, open space, and transportation requirements for each district. All development projects are reviewed for consistency with the planning principles established by the NADP.[2]

The NADP is the guiding advisory document for the Project Site, with development goals, objectives, and planning principles, along with planning goals specific to the NRP. The main development goal is to develop a world-class, shared-use R&D campus in association with government entities, academia, industry, and non-profit organizations. The NADP provides a framework to guide the use, renovation, management, and development of facilities at NASA ARC to achieve that goal. The NADP's primary objective is to extend and deepen the R&D capabilities of NASA ARC through R&D partnerships in key research areas. The unifying principles that guide planning for the entire NASA ARC site include:

- Creation of a Community
- Provision of On-site Housing
- Transportation Demand Management
- Public Accessibility
- Sustainability
- Resource Conservation
- Environmental Issues Management
- Wildlife Preservation

[2] NASA Ames Research Center. 2002. *NASA Ames Development Plan*. December 2002.

- Wetland Preservation
- Historic Resource Protection

Buildout of the NADP was projected to result in a total of 1,930 residential units, 4,909 residents, and 7,088 additional employees. Development in the NRP, where the Project Site is located, anticipated approximately 3 million square feet of new educational, office, R&D, museum, conference center, housing, and retail spaces. In addition, approximately 562,000 square feet of non-historic structures would be demolished and approximately 340,000 square feet of existing space would be renovated within the NADP. Development in the NRP area between 2002 and 2025 included the rehabilitation of several buildings within the NAS Sunnyvale Historic District, demolition of a mixed-use facility (Building 476) and construction of a new USGS lab (Building 800). Beyond 2025, there are currently no approved developments within the NRP area. Of the remaining developable area programmed in the NADP, NASA previously allocated approximately 1.4 million square feet of permitted uses for the proposed project, consisting of approximately 500,000 square feet of office/high density R&D uses; 514,700 square feet of educational space; 250,000 square feet of conference center space; and 144,200 square feet of retail/support space.3

Federal Aviation Regulation Part 77

Federal Aviation Regulation Part 77 establishes standards and notification requirements for objects affecting navigable airspace. This notification serves as the basis for:

- Evaluating the effect of the construction or alteration on operating procedures,
- Determining the potential hazardous effect of the proposed construction on air navigation,
- Identifying mitigating measures to enhance safe air navigation, and
- Charting of new objects.

Notification allows the Federal Aviation Administration (FAA) to identify potential aeronautical hazards in advance, thus preventing or minimizing the adverse impacts to the safe and efficient use of navigable airspace. NASA ARC has applied FAA civilian standards to determine adjacent land uses and airport operating clearances for Moffett Federal Airfield. Due to the Project Site's proximity to Moffett Federal Airfield, the Project Site is within an FAA notification area and height restriction area with a contour range of 157 feet above mean sea level based in National Geodetic Vertical Datum (NGVD) of 1988 to 182 feet above mean sea level based in NVGD of 1988, per Federal Aviation Regulation Part 77, Surfaces Map, for Moffett Federal Airfield.[4] Federal Aviation Regulation Part 77, Safe, Efficient Use, and Preservation of the Navigable Airspace, establishes imaginary surfaces for airports and runways as a means of identifying areas of airspace wherein objects would be obstructions to air navigation.

3.11.3.2 Regional and Local Regulations

The regional and local regulations listed below are included for informational purposes only, unless UC Berkeley or NASA has explicitly elected to comply. As stated above, UC Berkeley is

3 NASA. 2025. *Berkeley Space Center at NASA Research Park—NASA ARC Buildout Assumptions.* December 16.

4 Santa Clara County Airport Land Use Commission. 2012. Santa Clara County Moffett Federal Airfield Comprehensive Land Use Plan. Figure 6: Moffett Federal Airfield FAR Part 77 Surfaces. Adopted November 2, 2012; amended December 19, 2018.

constitutionally exempt from local governments' regulations, such as city and county general plans, land use policies, and zoning regulations, whenever using property under its control in furtherance of its educational purposes. Although the regional and local regulations below are provided for informational purposes, the regulations listed below are not analyzed further in this section. However, as noted below, select plans, policies, and regulations are referred to in respective resource section and/or applied as thresholds for analysis.

Plan Bay Area 2050

Senate Bill (SB) 375, adopted in 2008, requires preparation of a Sustainable Communities Strategy (SCS) as part of the Regional Transportation Plan (RTP) for the Bay Area. In the Bay Area, the Metropolitan Transportation Commission (MTC) and the Association of Bay Area Governments (ABAG) are jointly responsible for developing and adopting an SCS that integrates transportation, land use, and housing to meet greenhouse gas (GHG) reduction targets set by the California Air Resources Board (CARB). MTC and ABAG adopted Plan Bay Area 2050 in 2021. Plan Bay Area 2050 is the integrated land use/transportation plan and demographic/economic forecast for the nine-county San Francisco Bay Area region. The plan coordinates housing plans, open space conservation efforts, economic development strategies, and transportation investments. Plan Bay Area 2050 includes transportation and environmental strategies that support active and shared modes of travel, combined with a transit-supportive land use pattern that places housing near transportation centers.

To reduce GHG emissions, Plan Bay Area 2050 promotes compact mixed-use infill development within bikeable/walkable neighborhoods that are close to public transit, jobs, schools, shopping, parks, recreation, and other amenities. Local jurisdictions voluntarily identified Priority Development Areas (PDAs) as appropriate locations for these types of neighborhoods. Plan Bay Area 2050 also forecasts changes to the Bay Area population, including projected household and job growth, at the regional, county, and sub-county level. The Plan Bay Area 2050 Final Blueprint includes ABAG's most recent projections for demographic, economic, and land use changes in the coming decades.[5]

San Francisco Bay Plan

The San Francisco Bay Plan (Bay Plan) was prepared during 3 years of study and public deliberation by members of the San Francisco Bay Conservation and Development Commission (BCDC). In making its study of the bay, the commission had the help of numerous consultants and received extensive and invaluable aid from city, county, state, and federal agencies, along with specialists on university faculties and staff members from business organizations. In addition, the commission was assisted by an advisory committee whose 19 members contributed greatly in the review of the commission's work. The commission's study resulted in the publication of 23 volumes of technical reports. Summaries of the studies were printed as a supplement to the plan. The detailed reports are available for reference in numerous public libraries and offices of the commission.

The Bay Plan was completed and adopted by the BCDC in 1968 and transmitted to the California Legislature and the governor in 1969. In those actions, the commission completed the original

[5] Association of Bay Area Governments and Metropolitan Transportation Commission. 2021. *Plan Bay Area 2050: A Vision for the Future*. Released: October 1, 2021. Available: www.planbayarea.org/sites/default/files/documents/Plan_Bay_Area_2050_October_2021_rev.pdf. Accessed: December 30, 2025.

charge given to it in the provisions of the McAteer-Petris Act of 1965. That act created the commission, mandated study of the bay, and required preparation and submittal of a final report to the California Legislature in 1969. The federal Coastal Zone Management Act requires federal actions that affect the coastal zone to be consistent, to the maximum extent practicable, with approved state or local coastal zone plans. The Bay Plan is the approved coastal zone plan for the San Francisco Bay Area. Bay Plan Map 7 designates Moffett Federal Airfield as an "Airport Priority Use Area." A conclusion of the Bay Plan is that only limited areas of shoreline are suitable for "priority uses" such as airports, water-related industries, or wildlife refuges and that these areas should be reserved specifically for those uses.[6] However, the coastal zone would not be affected by the proposed project and the Project Site's status as an Airport Priority Use Area in the Bay Plan would not be affected by the proposed project. Thus, the proposed project would not require a consistency determination or other approval from BCDC.

Santa Clara County General Plan and Municipal Code

The Santa Clara County (County) General Plan establishes the overall policy framework for land use and development. Zoning districts and regulations must conform with and implement the goals and policies of the general plan. Subdivision regulations and all other discretionary land use approvals, including variances and use permits, must also conform with the general plan or they may not be legally approved. Under the County General Plan, the Project Site is designated as a Public Facility, a designation used for lands located outside of city or county urban service areas that are owned or operated by federal, State, or local governments for government purposes. Public Facility uses could include County government centers; federal government land, including lands used for defense or research installations; or other facilities of federal, State, or local governments. The Project Site is zoned A1 with Combining Districts, General Use, under the County Zoning Ordinance.[7]

The Santa Clara County General Plan and Municipal Code are included in this section for informational purposes. However, for purposes of CEQA and NEPA, UC Berkeley and NASA, respectively, have elected to use noise standards from the municipal code of the jurisdiction where the noise-sensitive receptor is located for the analysis of construction and operational noise sources associated with this project. For the proposed project, the nearest noise-sensitive land uses are in Santa Clara County. Section 3.12, *Noise*, and Chapter 4, *Environmental Impact Statement*, for an analysis of consistency with the Santa Clara County General Plan and Municipal Code.

Mountain View 2030 General Plan

The Mountain View 2030 General Plan is the guiding document for the city's physical development and preservation. It includes goals, policies, and graphics that convey a long-term vision and guide local decision-making to achieve that vision. The general plan is the foundation for zoning regulations, subdivisions, and public works plans. It also addresses other issues related to the city's physical environment, such as noise, open space, and safety. The entire NASA ARC is designated as

[6] San Francisco Bay Conservation and Development Commission. 2025. *San Francisco Bay Plan*. Plan Map 7: South Bay. Reprinted March 25, 2025. Available: www.bcdc.ca.gov/wp-content/uploads/sites/354/2025/05/SanFranciscoBayPlan_ADA.pdf. Accessed: January 28, 2026.

[7] Santa Clara County, 2012. *Santa Clara County Zoning Atlas*. Map 33. July 2, 2012. Available: https://stgenpln.blob.core.windows.net/document/zoning_atlas.pdf. Accessed: January 28, 2026.

"Institutional" in the 2030 General Plan Land Use Map.[8] The permitted range of uses supports public and quasi-public uses that serve an essential regional and/or local function. These include NASA ARC facilities as well as facilities owned by federal, state, or county governments. The 2030 General Plan emphasizes continued support of ARC as an important economic and cultural center that needs active connections to the city of Mountain View. In addition, the 2030 General Plan includes goals and policies specific to NASA ARC.[9]

For purposes of the CEQA transportation analysis for the proposed project (Section 3.16, *Transportation and Traffic*), UC Berkeley elected to use guidance from Office of Planning and Research (OPR) revised CEQA Statute and Guidelines and the Technical Advisory on Evaluating Transportation Impacts in CEQA (OPR Technical Advisory) as part of the analysis for the proposed project. Surrounding local jurisdictions, such as the City of Mountain View General Plan, have also generally relied on OPR guidance for setting their CEQA local thresholds and standard of significance. For the purposes of NEPA, NASA elected to use guidance from the City of Mountain View General Plan for evaluation of intersection and freeway level of service as part of the analysis for the proposed project. Refer to Section 3.16, *Transportation and Traffic*, and Chapter 4, *Environmental Impact Statement*, for an analysis of consistency with the City of Mountain View General Plan.

City of Sunnyvale General Plan

The City of Sunnyvale General Plan is the local government's long-term blueprint for the community's vision of future growth. It includes goals, policies, and programs that convey a long-term vision for the Sunnyvale community and guides local decision-making to advance that vision. The general plan is the basis for determining acceptable land uses and related park, road, and other infrastructure needs. The City of Sunnyvale General Plan contains the seven elements mandated by State law and was adopted as a consolidated document on July 26, 2011; the Land Use and Transportation Element was updated in March 2024. The City of Sunnyvale does not indicate a land use designation for NASA ARC. However, the Sunnyvale General Plan notes the City of Sunnyvale's interest in closely monitoring increased usage of Moffett Airfield for corporate collaborations and includes goals and policies specific to NASA ARC.[10]

For purposes of the CEQA transportation analysis for the proposed project (Section 3.16, *Transportation and Traffic*), UC Berkeley elected to use guidance from Office of Planning and Research (OPR) revised CEQA Statute and Guidelines and the Technical Advisory on Evaluating Transportation Impacts in CEQA (OPR Technical Advisory) as part of the analysis for the proposed project. Surrounding local jurisdictions, such as the City of Sunnyvale General Plan, have also generally relied on OPR guidance for setting their CEQA local thresholds and standard of significance. For the purposes of NEPA, NASA elected to use guidance from the City of Sunnyvale for evaluation of intersection and freeway level of service as part of the analysis for the proposed

9 City of Mountain View. 2012. *Mountain View 2030 General Plan*. Adopted July 10, 2012. Available: https://www.mountainview.gov/home/showpublisheddocument/6469/638214115708670000. Accessed: January 28, 2026.

10 City of Sunnyvale. 2024. *Sunnyvale General Plan—Land Use and Transportation Element*. Available: https://www.sunnyvale.ca.gov/home/showpublisheddocument/596/638757473948470000. Accessed: January 28, 2026.

project. Refer to Section 3.16, *Transportation and Traffic*, and Chapter 4, *Environmental Impact Statement*, for an analysis of consistency with the City of Sunnyvale General Plan.

Santa Clara County Moffett Federal Airfield Comprehensive Land Use Plan

The Santa Clara County Airport Land Use Commission was established to provide for appropriate development of areas surrounding public airports in Santa Clara County. It is intended to minimize the public's exposure to excessive noise and safety hazards, and to ensure that the approaches to airports are kept clear of structures that could pose an aviation safety hazard.

Due to the Project Site's proximity to Moffett Federal Airfield, the Project Site is within the area covered by the Santa Clara County Moffett Federal Airfield Comprehensive Land Use Plan (Moffett CLUP), adopted in 2012 by the Santa Clara County Airport Land Use Commission. The Moffett CLUP is intended to safeguard the general welfare of inhabitants within the vicinity of Moffett Federal Airfield and aircraft occupants. Although NASA has not elected to apply the Moffett CLUP to NASA ARC, compatibility criteria contained within the Moffett CLUP are applicable to development within the Project Site. The Moffett CLUP is also intended to ensure that surrounding new land uses will not affect Moffett Federal Airfield's continued operation. The Moffett CLUP provides a guide to NASA management, as custodian, for decisions that affect the future of Moffett Federal Airfield and provides a basis for additional assessments, if required. The Project Site is not within an Airport Safety Zone, as defined in the Moffett CLUP.

3.11.4 CEQA Findings

The following sections describe the environmental impacts of the proposed project on land use and planning in accordance with CEQA. The sections describe the thresholds used to determine whether an impact would be significant and the methods used to evaluate the impacts. Measures to mitigate significant impacts are provided, where appropriate.

A discussion of project impacts for land use and planning in accordance with NEPA is provided separately in Section 4.5.10, *Land Use and Planning*, in Chapter 4, *Environmental Impact Statement*.

3.11.5 Thresholds of Significance

In accordance with Appendix G of the State CEQA Guidelines, the project would have the potential to have a significant effect on land use and planning if it would result in any of the conditions listed below.

Would the project:

- Physically divide an established community?
- Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?
- Result in a cumulatively considerable contribution to a significant environmental impact with respect to land use and planning?

3.11.6 Methods for Analysis

CEQA requires an environmental impact report (EIR) to consider whether a proposed project would conflict with any applicable land use plan, policy, or regulation that was adopted for the purpose of avoiding or mitigating an environmental impact. This environmental determination differs from the larger policy determination of whether a proposed project is consistent with a jurisdiction's general plan. The former determination (intended for consideration in a CEQA document) is based on, and limited to, a review and analysis of environmental effects. The latter determination, by comparison, is made by the decision-making body of the jurisdiction and based on the jurisdiction's broad discretion to assess whether a proposed project would conform to the policies and objectives of its general plan/specific plan as a whole. In addition, the broader general plan consistency determination takes into account all evidence in the record concerning project characteristics, its desirability, as well as its economic, social, and other non-environmental effects.

A project's conflicts with land use policies do not, in and of themselves, constitute significant environmental impacts. Policy conflicts are considered environmental impacts only when they result in direct environmental effects. This analysis evaluates the consistency of the CEQA Proposed Project and the Project Alternative with policies adopted to avoid or mitigate environmental effects. Consistency with policies designed to avoid or mitigate environmental land use impacts are discussed in this section; consistency with policies designed to avoid or mitigate other physical impacts are discussed in sections that address those particular impacts (e.g., consistency with the National Historic Preservation Act and the Secretary of the Interior's Standards is discussed in the section that addresses historic resources). As discussed above, UC Berkeley is part of the University of California, a constitutionally created entity of the State of California (State), with "full powers of organization and government" (California Constitution, Article IX, Section 9). As a constitutionally created State entity, UC Berkely is not subject to municipal regulations of surrounding local governments, such as general plans and municipal codes. Similarly, as a federal agency, NASA is not subject to regulations at the city, county, or state level, unless authority is explicitly authorized by federal law or NASA policy or otherwise delegated by the federal government to the state for implementation and enforcement. Therefore, regional and local regulations do not pertain to the Project Site and are not analyzed further in this section.

3.11.7 Impacts Not Evaluated in Detail

Division of an Established Community

The proposed project would redevelop a site that is already developed. Specifically, it would aim to provide a greater connection with the rest of NASA ARC and surrounding communities. After implementation of the CEQA Proposed Project or CEQA Reduced Density Alternative, the Project Site would be bounded by Wescoat Road, Cody Road, and Girard Road. These roadways would provide site access as well as access to other areas of the NRP, Eastside/Airfield, and Ames campus, thereby increasing connectivity. In addition, Cody Road connects to Ellis Street, which provides direct access to U.S. 101. The Project Site is connected to the surrounding roadway network, which serves vehicles, emergency vehicles, pedestrians, and bicyclists. The proposed bicycle network would provide access and connections to other portions of NASA ARC north of the Project Site and the Bayshore/NASA Santa Clara Valley Transportation Authority (VTA) light rail station south of the Project Site. Therefore, rather than dividing an established community, the proposed project would provide increased connections to the surrounding communities.

A major goal outlined in the proposed Berkeley Space Center Master Plan (Master Plan) included in Appendix 2-1 of this joint EIR/EIS is to adopt a comprehensive approach that encompasses the entire district by integrating architecture, landscaping, open space, transportation networks, and other environmental considerations. The proposed project is intended to be a "center-point" of NASA ARC, a hub where industry, university, and government organizations come together to collaborate. Although the proposed buildings at the Project Site would add new development to the area, the development would be in an area with similar uses that are already physically separated from Mountain View and Sunnyvale by the airfield to the east, U.S. 101 to the south, and the rest of NASA ARC to the west. Nonetheless, the orientation of the Project Site would provide direct connections and easy access to the surrounding communities for vehicles, bicycles, pedestrians, and transit. Therefore, the proposed project would not divide the established communities surrounding the Project Site, resulting in no impact. This topic is not evaluated further.

3.11.8 Impacts and Mitigation Measures

Impact CEQA-LU-1: Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Impact Summary

	Level of Significance before Mitigation	Mitigation Measures Required	Level of Significance after Mitigation
CEQA Proposed Project	Less than Significant	—	—
CEQA Proposed Project with the Variant	*Same as CEQA Proposed Project*	—	—
CEQA Reduced Density Alternative	Less than Significant	—	—
CEQA Reduced Density Alternative with the Variant	*Same as CEQA Reduced Density Alternative*	—	—

CEQA Proposed Project (NEPA Build Alternative 1)

Consistency with the NASA Ames Development Plan

The NADP, as discussed in more detail below, is a comprehensive long-range land use plan that has guided the use, renovation, management, and development of facilities. The NADP is the guiding regulatory document for the Project Site, with development goals, objectives, and planning principles, along with planning goals specific to the NRP. The NADP describes NASA's plan for development of the property under its jurisdiction and stewardship. The plan is broken down into various planning and development districts and includes a description of land use, infrastructure, facilities, open space, and transportation requirements for each district. All development projects are reviewed for consistency with the planning principles established by the NADP.[11]

[11] NASA Ames Research Center. 2002. *NASA Ames Development Plan*. December 2002.

Land Use Consistency. Under the NADP, allowed development within the NRP planning area includes laboratories, office space, classrooms, auditoriums, museums, a conference center, open space, a burrowing owl preserve, parking, housing, and limited retail facilities. Specifically, development in the NRP anticipated approximately 3 million square feet of new educational, office, R&D, museum, conference center, housing, and retail spaces. Within the NRP planning area, the Project Site has been designated as University Reserve. The University Reserve designation is intended for educational facilities but could include uses such as classrooms, offices, lecture halls, research facilities, and the ancillary facilities required to achieve NASA's mission related to education and outreach. The proposed FAR (i.e., the total proposed square footage divided by the total parcel boundary [34.92 acres]) for the CEQA Proposed Project is 1.6; the proposed FAR for the CEQA Reduced Density Alternative is 1.0. As explained above, the NADP used floor area ratios (FARs) to identify preferred densities at the time it was prepared, but the FARs are not regulatory requirements. Thus, there is no minimum or maximum FAR applicable to the Project Site and the developable area established by the Project Proponent's Enhanced Use Lease applies to the Project Site.

The CEQA Proposed Project would create approximately 2.3 million square feet of Research and Office Uses, Conference Uses, Active Uses, Student/Faculty Housing, and Short-Term Lodging for visitors and conference attendees. Office uses would include space for corporate and general offices, which would allow multiple tenants to carry out research and technology, administrative, and professional office activities. In addition, the proposed laboratory and R&D uses would provide functional spaces that could include laboratories, supportive administrative offices, meeting rooms, and light manufacturing or fabrication spaces as part of the overall R&D use. The CEQA Proposed Project would include approximately 145 Student/Faculty Housing units within Subarea 6 that would be used by UC students or faculty on a short-term basis (i.e., academic calendar year, semester, summer). The Student/Faculty Housing would include a mix of studio, one-bedroom, and two-bedroom apartments as well as amenity space.

The land uses proposed at the Project Site under the CEQA Proposed Project would be consistent with the intent of the University Reserve land use designation. As discussed above, the University Reserve designation includes classrooms, offices, lecture halls, research facilities, and the ancillary facilities required to achieve NASA's mission related to education and outreach. These uses would also further NASA's purpose of the proposed project to support the integration of public and private research development efforts. Although residential uses are allowed in the NRP, the description of the University Reserve designation does not specifically include residential. However, residential uses under the CEQA Proposed Project would include short-term lodging for visitors and conference attendees and Student/Faculty Housing on a short-term basis (i.e., academic calendar year, semester, or summer). Housing would prioritize the UC students and faculty affiliated with the CEQA Proposed Project as well as on-site federal employees and student interns. Therefore, the proposed residential uses are consistent with the "ancillary facilities required to achieve NASA's mission related to education and outreach." The CEQA Proposed Project would not result in inconsistencies with the NADP land use designation for the Project Site. Impacts would be less than significant.

In addition to the land uses proposed at the Project Site, the CEQA Proposed Project includes approximately 6 acres of Off-Site Areas where utility improvements and building demolition would take place. Certain off-site utility improvements may be constructed within the limits of Zook Road, Cummins Avenue, Wescoat Road, Bailey Road, Perimeter Road, Cody Road, Clark Road, and Moffett Boulevard, dependent on utility layout options selected and to the extent feasible. Together, the

Project Site and Off-Site Areas comprise the approximate 45-acre Limits of Work. The Project Site is within the city of Mountain View Sphere of Influence but outside of any city's jurisdictional limits. The Off-Site Areas are also within the city of Mountain View Sphere of Influence; most of the Off-Site Areas are outside of any city's jurisdictional limits, with the exception of the northern portion and the southwestern portion, which are within the city of Mountain View. A small portion of the Off-Site Areas is on federal land owned by the Army. Any off-site utility improvements required for the CEQA Proposed Project and the CEQA Reduced Density Alternative would be subject to review and approval by NASA (for work within NASA jurisdiction) and/or potentially other landowners or entities with jurisdiction. In addition, as part of the CEQA Proposed Project, existing Buildings 543, 583A, 583C, 547E, and 944 would be demolished to accommodate the proposed off-site utility improvements and realignment of Girard Road. The CEQA Proposed Project would not result in inconsistencies with the NADP land use designations for the off-site areas. Impacts would be less than significant.

Consistency with NADP Planning Principles. The NADP provides a framework to guide the use, renovation, management, and development of facilities at NASA ARC. The main development goal of the NADP is to develop a world-class, shared-use R&D campus in association with government entities, academia, industry, and non-profit organizations. The NADP's primary objective is to extend and deepen the R&D capabilities of NASA ARC through R&D partnerships in key research areas. The CEQA Proposed Project would meet the main development goal and objective by leveraging its strategic position within a growing aerospace cluster and providing a spatial framework for a world-class research environment through partnerships with academic institutions. The NADP also includes the following unifying principles that guide planning for the entire NASA ARC: creation of a community, provision of on-site housing, transportation demand management (TDM), public accessibility sustainability, resource conservation, environmental issues management, wildlife preservation, wetland preservation, and historic resource preservation.

The determination of whether or not the CEQA Proposed Project would conflict with applicable policies adopted for the purpose of mitigating an environmental impact is addressed in part by the regulatory setting and environmental analysis provided in each resource section of this joint EIR/environmental impact statement (EIS). For example, noise- and vibration-related policies are addressed in Section 3.10, *Noise,* and transportation- and circulation-related policies are addressed in Section 3.16, *Transportation and Traffic*. In addition, Table 3.11-1 summarizes the unifying principles of the NADP that were adopted for the purpose of avoiding or mitigating an environmental impact and provides a determination of either "consistent" or "inconsistent" for each principle. Based on this analysis, the CEQA Proposed Project would be consistent with the environmental principles contained in the NADP, resulting in a less-than-significant impact. The ultimate determination of the consistency of the CEQA Proposed Project with the NADP overall (not only policies adopted for the purpose of protecting the environment) will be made by NASA.

Table 3.11-1. CEQA Proposed Project Consistency with NASA Ames Development Plan Principles

NADP Planning Principles	Project Consistency Analysis
Creation of a Community. Under the NADP, ARC will continue to provide critical municipal-type functions to the entire site, including NASA ARC. The mandatory services provided by NASA involve public safety, land use planning, code compliance and permitting, and safety, health, and environmental risk management oversight. Public safety includes police emergency response, law enforcement, structural fire response, fire marshal services, medical emergency response, and hazardous materials first response. NASA has established its own building permit process and architectural review board. ARC has adopted the California Building Standards Code. All developments at ARC will need to comply with these codes and receive NASA-issued permits prior to construction.	**CONSISTENT.** The CEQA Proposed Project would receive the mandatory public services provided by NASA, as included in Section 3.14, *Public Services*, of this joint EIR/EIS. As stated, police services for the Project Site would be provided by the National Aeronautics and Space Administration Ames Research Center (NASA ARC) through a contract service via the NASA/ARC Protective Services Contract—South Region. In addition, fire protection and emergency medical services for the Project Site would continue to be provided by NASA Ames Fire Department and the County of Santa Clara Emergency Medical Services Agency. As discussed in Section 3.7, *Geology, Soils, and Paleontological Resources*, of this joint EIR/EIS, the CEQA Proposed Project would comply with the California Building Standards Code. In addition, as discussed in Chapter 2, *Proposed Project/Proposed Action and Alternatives*, upon completion of the NEPA process, the specifics regarding each building's architectural design and configuration within the Project Site will be reviewed for conformance and approval through NASA's NRP Design Review Board process (pursuant to APR 8822.1). The Design Review Program is typically a two-stage process: Pre-Conceptual Design Review (to adequately define the scope of a project, to determine the level of environmental review needed for site approval, and to ensure that an applicant conforms to applicable requirements) and Preliminary Design Review (which includes submission for the CDP). The NEPA process would address the purpose of the Pre-Conceptual Design Review stage; thus, the need for a Pre-Conceptual Design submission for the proposed project may be waived. During the Preliminary Design Review stage, NASA will assess whether the design and configuration of the proposed project complies with the NADP and Project Site-specific NEPA documents, including the Maximum and Minimum Development Parameters and Standards, as documented in the ROD. Overall project approval consistent with the procedures outlined in APR 8829.1 is required before NASA will issue any permits for construction for the proposed project. Furthermore, APR 8829.1 establishes minimum requirements that provide a reasonable level of safety as it pertains to public health and general welfare through structural strength; safety for life and property with respect to fire, explosion, and other hazards, and a reasonable level of safety for fire and emergency responders during emergency operations.
Provision of On-site Housing. A critical component that enables the NADP is housing. The provision of on-site housing will contribute to a campus-like environment and allow some students, educators, and researchers an opportunity to come to the Silicon Valley,	**CONSISTENT.** The CEQA Proposed Project includes approximately 145 Student/Faculty Housing units within Subarea 6. Housing would prioritize the UC students and faculty affiliated with the CEQA Proposed Project as well as on-site federal employees and student interns. In addition, The CEQA Proposed Project would include approximately 100 short-term lodging units within Subarea 1. The short-term lodging would be used as temporary lodging for staff

NADP Planning Principles	Project Consistency Analysis
those who might not otherwise be able to because of the region's high cost of living.	members, researchers, academics, tenants, and their families while visiting the Project Site for conferences, meetings, research projects, and other short-term events. The provision of on-site housing would help to promote a campus-like environment and locate employees, students, and visitors near residential and academic uses, reducing the demand for travel in single-occupancy vehicles.
Transportation Demand Management. ARC is committed to aggressive TDM and offers, incentives, and programs to encourage an alternative community. A specific TDM plan has been developed for the NRP. Parking in the NRP will be kept to a minimum to encourage the use of public transportation. The NASA Ames Design Guide will ensure a minimal visual impact associated with the parking areas from the street and adjacent buildings.	**CONSISTENT.** The CEQA Proposed Project includes a project-specific TDM plan to reduce the vehicle trips and associated vehicle miles traveled (VMT) generated by the proposed project through a range of design features (e.g., mix of complementary land uses to increase internal trips, on-site amenities to reduce off-site trips, pedestrian and bicycle infrastructure, preferential carpool and vanpool parking, limited automobile parking supply, and ample bicycle parking) and ongoing operational programs (e.g., transit pass/subsidy programs, shuttles, and participation in the NRP Transportation Management Association) to achieve TDM mode-shift targets and thereby reduce the number of trips made by project-generated employees, students/faculty and visitors. Appendix 2-4 of this joint EIR/EIS includes the proposed project-specific TDM plan. The project-specific TDM plan is designed to reduce the trip generation by at least 22 percent as part of the CEQA Proposed Project. The 22 percent TDM reduction aligns with the TDM requirements in the 2002 PEIS. Section 3.16, *Transportation and Traffic*, of this joint EIR/EIS include further details about the TDM plan. Mitigation Measure TRAN-1 would require a mitigated TDM plan that would achieve up to a 31 percent reduction (29 percent under the CEQA Proposed Project), which would help the CEQA Proposed Project to achieve VMT reductions, resulting in less-than-significant impacts. The proposed parking garages would be in the southeast and southwest corners of the Project Site, within Subareas 4 and 6. The height of the parking garages would be consistent with the height of the other proposed buildings. The parking garage in Subarea 4 would be set back from the southeast corner of the Project Site by the open space area at the intersection of Cody Road and Girard Road, allowing views of Hangar One to be maintained from this area. In addition, the parking structure in Subarea 6 would be set back from Wescoat Road by Gateway Plaza, allowing a view corridor from the Project Site to the Shenandoah Plaza and NAS Sunnyvale Historic District.
Public Accessibility. The NADP envisions an environment in which people and ideas flow freely through the site. To allow greater public access to many parts of the site, NASA ARC has redesigned the security perimeter.	**CONSISTENT.** Access to the Project Site and the surrounding area is currently controlled through security and visitor checkpoints located at the main gate on Clark Road or at the gate located on Ellis Street. However, separate from the CEQA Proposed Project, NASA anticipates operational modifications to allow a free flow of traffic at these two checkpoints. No physical improvements are required for these operational modifications, which are referred to as "Open Campus," as discussed under the *Open Campus* subheading in Section 2.3.5 in Chapter 2. With implementation of "Open Campus," at

NADP Planning Principles	Project Consistency Analysis
	occupancy of Phase 1 and prior to Phases 2 to 4 of construction, the Project Site would be connected to Wescoat Road, Cody Road, and Girard Road, which would provide public access to the Project Site and other areas of the NRP, Eastside/Airfield, and Ames campus.
Sustainability. ARC plans to incorporate sustainable design concepts into the NADP by encouraging its partners to design, construct, and operate structures according to the Leadership in Energy and Environmental Design (LEED) Green Building Rating System. ARC will encourage its partners to strive for the highest possible LEED rating in their building designs and at least meet the minimum required score to achieve LEED certification.	**CONSISTENT.** The CEQA Proposed Project would incorporate various sustainability strategies for both the proposed buildings and landscaping to reduce energy consumption, water consumption, and waste generation. The CEQA Proposed Project would achieve, at a minimum, a Leadership in Energy and Environmental Design (LEED) Silver rating. The proposed sustainability design responds to the climate and context by optimizing thermal comfort through passive cooling, providing windbreaks, prioritizing daylight within floor plates of the buildings and outdoor spaces, and providing a variety of courtyards and amenity terraces and patios. In addition, the CEQA Proposed Project would install photovoltaic systems as a strategy for generating power on-site and offsetting the energy use from each proposed building. Section 3.6, *Energy*, of this joint EIR/EIS discuss sustainability and energy use.
Resource Conservation. ARC is committed to energy conservation. All development projects will include appropriate conservation measures, such as energy-efficient lighting. Through its design guidelines and construction requirements, the NADP will promote further conservation, including a passive solar design, solar water heating, and photovoltaic arrays. Irrigation will use reclaimed water. NASA's sustainable design guidelines will also require the use of low-flow plumbing fixtures in all new construction.	**CONSISTENT.** As discussed above, the CEQA Proposed Project would design the proposed buildings and landscaping with sustainability strategies to promote resource conservation. In addition, the CEQA Proposed Project would incorporate potable water conservation features within buildings (e.g., low-flow fixtures for indoor water use, dual plumbing for recycled water usage for flushing), a drip irrigation system, and drought-friendly and ecologically appropriate plantings. The CEQA Proposed Project would also be designed to conserve resources and protect water quality through the management of stormwater runoff using low-impact development (LID) methods, where feasible. To treat stormwater discharges from the Project Site, the CEQA Proposed Project would incorporate a variety of stormwater treatment methods, including bioretention areas, flow-through planters, green roofs, rainwater cisterns, media filters, permeable pavement/pavers, self-treating landscaped areas, Silva Cells, and a centralized stormwater retention basin. The CEQA Proposed Project would also include a Water Reuse Facility (WRF) Option, which would produce recycled water for the proposed buildings and irrigated areas. The facility would process all of the CEQA Proposed Project's wastewater and have the capacity to process wastewater from the planned housing development south of the Project Site to supplement recycled water needs within the Project Site. All new building systems (e.g., heating, ventilation, air-conditioning [HVAC], mechanical systems) would be supplied with electricity, eliminating the need for connections to Pacific Gas & Electric's (PG&E) natural gas infrastructure for building operations. The CEQA Proposed Project also includes a Central Utility Plan (CUP) Option, which would provide a sustainable centralized heating and cooling system for all buildings

NADP Planning Principles	Project Consistency Analysis
	instead of building-by-building HVAC systems. Section 3.6, *Energy*, of this joint EIR/EIS discuss resource conservation and energy use. As stated in Section 3.6, the CEQA Proposed Project would be designed to incorporate environmentally sustainable features to reduce energy consumption and improve energy efficiency. Nonetheless, as demonstrated in Section 3.6, energy consumption during operation of the CEQA Proposed Project (with and without the CUP and WRF options) could result in a significant impact if additional measures or practices are not implemented to improve the energy efficiency of operational activities and reduce overall energy consumption to the greatest extent feasible. Implementation of Mitigation Measures AQ-1, AQ-2, AQ-6, and TRAN-1 would result in less-than-significant impacts related to the wasteful, inefficient, or unnecessary consumption of energy resources.
Environmental Issues Management. NASA has prepared an Environmental Issues Management Plan to address contamination, hazardous waste, and cleanup. Specifically, the plan involves the protection of construction workers, the use of remediation systems in contaminated areas, and the disposal of contaminated soils and groundwater encountered during construction. In addition, an Environmental Compliance Program has been designed to ensure that hazardous materials are managed in compliance with federal, state, and local laws. All development partners will be required to comply with the Environmental Issues Management Plan (EIMP) and the Environmental Compliance Program.	**CONSISTENT.** Soil and groundwater at the Project Site have been affected by contamination associated with the Middlefield-Ellis-Whisman (MEW) Superfund Site and the U.S. Navy's operations at Naval Air Station Moffett Field. In addition, many of the buildings within the Project Site contain hazardous materials, such as asbestos-containing material (ACM) and lead-based paint (LBP); electrical equipment contains polychlorinated biphenyl (PCBs). Furthermore, hazardous materials have been or are being stored within the Project Site. As outlined in Section 3.9, *Hazards and Hazardous Materials*, of this joint EIR/EIS, the Spring 2026 project-specific EIMP was prepared for the Project Site to provide a decision framework for the management of residual chemicals in soil, groundwater, and existing structures as well as future structures within the Project Site during occupancy and development. The Spring 2026 project-specific EIMP includes required procedures that must be followed to address the known remaining environmental conditions within the Limits of Work. As discussed in Section 3.9, *Hazards and Hazardous Materials*, the CEQA Proposed Project would comply with requirements outlined in the Spring 2026 project-specific EIMP. In order to reduce impacts related to vapor intrusion, the Spring 2026 project-specific EIMP (Mitigation Measure HAZ-1) would be implemented to reduce potential vapor intrusion risks to less than significant.
