Executive Summary

Rincon Consultants, Inc. (Rincon) has prepared this Data Summary Submittal (DSS) on behalf of Planetary Ventures, LLC (PV) for the sampling and analytical activities associated with the abatement activities conducted within the low occupancy area of Zone 1 of Hangar 1 (Figure 1), located at the Former Naval Air Station Moffett Field, California. This work was conducted pursuant to the Agency-approved Final Hangar 1 Non-Time-Critical Removal Action (NTCRA) Work Plan. This DSS has been prepared to document achievement of the Cleanup Goals for the structural steel within the low occupancy area of Zone 1 of Hangar 1.

The National Association of Corrosion Engineers (NACE) inspections indicate that the polychlorinated biphenyls (PCBs) and lead impacted paint was successfully removed and the surface cleanliness goal has been met, as shown in Attachment 1, and the Data Usability Assessment (DUA) indicates that the collected confirmation wipe sampling data are suitable for comparison against the numerical Cleanup Goals. The 95-percent upper confidence limit (UCL) for the mean lead concentration in the 86 confirmation wipe samples collected from within the low occupancy area of Zone 1 was approximately 160 micrograms per square feet ($\mu g/ft^2$), which is below the numerical Cleanup Goal for lead (i.e., 250 $\mu g/ft^2$). The 95-percent UCL for the mean PCB concentration in the confirmation wipe samples was not calculated because PCBs were not detected above the laboratory quantitation limit of 1 microgram per 100 square centimeters (i.e., 1 $\mu g/100\ cm^2$) in any of the confirmation samples collected from within the low occupancy area of Zone 1.

Based on the NACE inspections and the PCB and lead confirmation wipe sampling results, the abated structure within the low occupancy area of Zone 1 is suitable for low occupancy use. Based on the findings presented herein, PV requests that the United States Environmental Protection Agency and San Francisco Bay Regional Water Quality Control Board provide concurrence that no further abatement is required for the low occupancy area of Zone 1.

1 Introduction

Rincon Consultants, Inc. (Rincon) has prepared this Data Summary Submittal (DSS) on behalf of Planetary Ventures, LLC (PV) to document attainment of the Cleanup Goals within the low occupancy area[1] of Zone 1 of Hangar 1 (Figure 1), located at Former Naval Air Station Moffett Field, California, conducted pursuant the Agency-approved[2] Final Hangar 1 Non-Time-Critical Removal Action (NTCRA) Work Plan (EKI, 2022). Additional details about the sampling procedures and analytical methods used in the collection of these samples are presented in the NTCRA Work Plan.

The NTCRA is currently being performed by PV on behalf of the National Aeronautics and Space Administration (NASA), the Responsible Party for Hangar 1, and is being conducted by McCarthy Building Company (McCarthy), which has been retained by PV. The United States Environmental Protection Agency (U.S. EPA) and the San Francisco Bay Regional Water Quality Control Board (Water Board) are the Regulatory Agencies with regulatory oversight during implementation of the NTCRA. Additional details about the removal action are presented in the NTCRA Work Plan (EKI, 2022).

This DSS has been prepared to document achievement of the Cleanup Goals for the structural steel within the low occupancy area of Zone 1 of Hangar 1 and includes:

(1) The National Association of Corrosion Engineers (NACE) inspection reports documenting the removal of all visible paint from the abated surfaces and achievement of a NACE #3/Society for Protective Coatings (SSPC) SP-6 Surface Cleanliness Standard (Attachment 1);
(2) The tabulated confirmation wipe sampling results for the validated data (Attachment 2);
(3) The final laboratory analytical reports for the confirmation wipe samples and field quality control (QC) samples (Attachment 3);
(4) The input and output files for the calculated 95-percent upper confidence limit (UCL) for the mean concentration of lead in the confirmation wipe samples (Attachment 4); and,
(5) The data validation reports prepared by Lab Data Consultants (LDC) (Attachment 5).

In addition to the information above, this DSS includes the final laboratory analytical reports for the clearance wipe samples collected from Enclosures A, B, C, and D,[3] and a table summarizing these results (Attachment 6).

[1] The low occupancy area of Zone 1 includes the entirety of Enclosure D, as well as the areas higher than 55-feet above the hangar floor in Enclosures A, B, and C.

[2] The NTCRA Work Plan was approved by the Agencies on March 4, 2022.

[3] Clearance wipe samples from Enclosures A, B, and C were collected from both the high and low occupancy areas of the enclosures.

2 Attainment of Cleanup Goals

In accordance with Section 5.1 of the NTCRA Work Plan, the Cleanup Goals for non-porous surfaces are as follows.

Substrate	Chemicals	Elements	Cleanup Goals
Non-Porous Surfaces	• PCBs • Lead	• Visual Inspection by qualified NACE/SSPC surface coating inspector	• No visible paint remains • Achievement of NACE #3/SSPC SP-6 surface preparation and visible cleanliness standard
		• Collection and analysis of wipe confirmation samples	• PCBs: ≤100 micrograms per 100 square centimeters (µg/100 cm^2) • Lead: <250 micrograms per square foot (µg/ft^2)

The numerical Cleanup Goal is that the 95-percent UCL of the mean concentration of PCBs and lead in the confirmation wipe samples are below the indicated levels. In addition, the NTCRA Work Plan requires that no single confirmation wipe sample result exceeds 5-times the Cleanup Goal and that no more than 10-percent of the confirmation wipe sample results exceed 3-times the Cleanup Goal.

The visual inspection (Section 2.1) and confirmation wipe sampling (Section 2.2) results indicate that the Cleanup Goals have been met and no additional abatement is necessary within the low occupancy area of Zone 1.

2.1 Visual Inspections

In accordance with the NTCRA Work Plan, following completion of abatement and cleaning activities[4] and prior to the collection of confirmation wipe samples, a qualified NACE inspector inspected the surfaces for the presence of visible paint and the achievement of a NACE #3/SSPC SP-6 surface cleanliness standard.

Within the low occupancy area of Zone 1, the qualified NACE inspector confirmed that all visible paint had been removed from the abated surfaces and that the abated surfaces achieved a NACE #3/SSPC SP-6 surface cleanliness standard or better. The NACE inspection reports are included in Attachment 1.[5]

2.2 Confirmation Wipe Sampling Results

In accordance with the NTCRA Work Plan, following confirmation that the non-porous surfaces met NACE #3/SSPC SP-6 surface preparation and visual cleanliness standard, confirmation wipe samples were collected for comparison to the numerical Cleanup Goals for PCBs and lead.

[4] Abatement in Zone 1 was completed on August 18, 2022.

[5] The Zone and Enclosure, as well as the scaffolding levels that correspond with wipe sample locations are provided within the header and/or notes sections of the NACE inspection reports.

2.2.1 Initial Abatement and Sampling Efforts

A total of 204 confirmation wipe samples[6] were collected from the low occupancy area of Zone 1, including all QC samples, i.e., media blank samples and field duplicate samples. Of the 204 confirmation wipe samples and associated QC samples, 102 were lead wipe samples and 102 were PCB wipe samples, including:

- Eighty-six (86) lead confirmation wipe samples, and 86 PCB confirmation wipe samples;
- Six lead media blank samples and six PCB media blank samples; and,
- Ten lead duplicate confirmation wipe samples and ten PCB duplicate confirmation wipe samples.

The tabulated confirmation wipe sampling and QC results, with both laboratory and data validation flags are included in Attachment 2. The laboratory analytical reports for confirmation wipe samples and QC samples are included in Attachment 3. Based on the data validation reports (Attachment 5), QC samples, and the data useability assessment (Section 3), the validated confirmation wipe sampling data (Attachment 2) are considered suitable for comparison to the numerical Cleanup Goals.

2.2.2 Re-Abatement and Re-Sampling Efforts

Due to high lead concentrations in the original confirmation wipe samples collected from some areas within the low occupancy area of Zone 1, these areas were re-abated, re-cleaned, and re-sampled. Specific details regarding these locations are presented below. As PCBs were not detected in any of the confirmation wipe samples, re-abatement due to elevated PCB concentrations was not necessary.

Within Zone 1 Enclosure D, lead was detected in one sample and one duplicate sample at concentrations exceeding 3-times the Cleanup Goal at two sampling locations (i.e., ARCH-C1W-INT-2.5 TO 3.5-220721-WF [910 µg/ft^2] and DOOR-N-0.9-GW-EXT-9 TO 10-220721-CB-DUP [1,100 µg/ft^2]). Although the reported concentrations were not greater than 5-times the Cleanup Goal for lead, and less than 10-percent of the analytical results were greater than 3-times the Cleanup Goal, Certified Coatings Company (CCC) and McCarthy opted to re-abate these areas. The approximately 2,000 square foot areas represented by each of these sample locations (for a total of 4,000 square feet) were re-abated, re-cleaned and re-sampled, which resulted in the collection of two additional lead samples and one additional duplicate lead sample. Lead concentrations in the confirmation wipe samples collected following re-abatement were 70 µg/ft^2 and 14 µg/ft^2, respectively.

Within the low occupancy portion of Enclosure B, lead was detected at concentrations higher than the Cleanup Goal but less than 3-times the Cleanup Goal at two locations (i.e., DOOR-N-0.7GW-PS-19-220805-G [680 µg/ft^2] and DOOR-N-0.7GE-PS-19-220805-G [650 µg/ft^2]). Following re-abatement and re-cleaning, two additional confirmation wipe samples were collected for lead and the reported lead concentrations in the re-abated areas were 4.2 µg/ft^2 and 4.6 µg/ft^2, respectively.

2.2.3 Evaluation of the Confirmation Wipe Sampling Data

All PCB confirmation wipe sample results were below the laboratory quantitation limit (QL) of 1.0 µg/100 cm^2 for all of the PCBs analyzed; therefore, none of the PCB sample results exceeded the Cleanup Goal for the low occupancy area of ≤100 µg/100 cm^2.

Following re-abatement, re-cleaning, and re-sampling activities, a total of 10 of the lead confirmation wipe samples collected, or 11-percent, exceeded the Cleanup Goal of <250 µg/ft^2; however, none of these samples exceeded 3 or 5-times the Cleanup Goal.

[6] Wipe samples from areas that were re-abated and re-sampled are not included in this total count and are discussed in Section 2.2.2.

Rincon calculated the 95-percent UCL for the mean lead concentration in the confirmation wipe samples using Version 5.2 of the ProUCL program (U.S. EPA, 2022). The 95-percent UCL of the mean lead concentration was calculated using all lead confirmation wipe samples; the results for the media blank samples, the lower of the duplicate sampling results, and the original results from locations that were re-abated and re-sampled were not included in the calculation of the 95-percent UCL. The 95-percent UCL input and output files are included in Attachment 4. As seen in Table 1 the 95-percent UCL of the mean lead concentration (i.e., 160 µg/ft^2) in the confirmation wipe samples is below the Cleanup Goal. The 95-percent UCL of the mean PCB concentration was not calculated because PCBs were not detected above laboratory QLs in any of the confirmation wipe samples collected.

Table 1 95-Percent UCL for Confirmation Wipe Samples

Analyte	Method	Cleanup Goal	95% UCL
Lead	US EPA Method 3050M/6010B	<250 µg/ft^2	160 µg/ft^2
PCB	US EPA Method 8082	≤100 µg/100 cm^2	--[a]

Notes:
[a] The 95-percent UCL was not calculated for PCBs because all analytical results were below laboratory QLs.

3 Data Usability Assessment

This section summarizes Rincon's review of the data validation reports prepared by LDC for the confirmation wipe samples (Attachment 5). It also reviews field documentation and procedures for compliance with sampling procedures included in the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) as well as the number of samples and field QC samples to confirm they are consistent with frequencies included in the UFP-QAPP.

Based on this data usability assessment, the validated confirmation wipe sampling data are considered suitable to assess whether the 95-percent UCL of the mean concentrations of lead and PCBs in the confirmation wipe samples are less than the numerical Cleanup Goals.

3.1 Data Verification

At the end of each day, Rincon personnel verified that appropriate field records were present and complete for each specific activity conducted. In addition, Rincon personnel verified that all of the planned samples, including field QC samples, were collected and adequately documented. The Rincon Data Manager verified that all changes/exceptions to the scope of work were documented and reported appropriately in Biweekly Reports prepared during abatement activities. Chain-of-custody forms were reviewed on a daily basis by the Rincon Data Manager to confirm that each form was filled out appropriately, and that all required samples, signatures, and dates were present.

A field audit, which included a review of the field sampling protocols, was conducted on June 30, 2022. Rincon's field manager observed field personnel conducting field sampling activities to confirm that all activities were conducted in accordance with the SOPs developed for field sampling activities associated with the NTCRA.[7] The results of the field audit indicated that the field activities being conducted at Hangar 1, including confirmation wipe sampling activities, were being conducted in accordance with the NTCRA Work Plan as well as the SOPs developed for field activities associated with the NTCRA.

Field QC samples were collected in accordance with the UFP-QAPP. A summary of the total number of samples and field QC samples is provided for lead and PCBs in Table 2 and Table 3, respectively.

Table 3 PCB Wipe Sample Summary

	No. of PCB Confirmation Wipe Samples	No. of Field Duplicates or Frequency	No. of Media Blanks or Frequency
Required frequency per UFP-QAPP Worksheet #20-2	1 sample per every 2,000 ft^2 of abated steel	10%	5%
Anticipated Number of Samples	73 [a]	8 [10%]	4 [5%]

Notes: [a] Original sample counts included in the UFP-QAPP were based on an estimated surface area of 145,000 ft^2 of steel.			

Confirmation lead and PCB wipe samples were collected at a rate of approximately one sample per 1,900 square feet (ft^2) of abated steel (i.e., a slightly greater frequency than described in Worksheet #20-2 of the UFP-QAPP). The number of media blank samples and field duplicate samples was slightly greater than the number described in Worksheet #20-2 of the UFP-QAPP.

One additional lead duplicate field sample was collected during re-abatement activities as described in Section 2.2.2.

3.2 Data Validation

LDC conducted data validation on the analytical laboratory reports for the confirmation wipe samples collected, which included a review of chain-of-custody forms and laboratory deliverables. Stage 3 validation was conducted on 62 samples and Stage 2A validation was conducted on the remaining 142 samples (Attachment 5).

Based on LDC's review of the analytical laboratory reports and their supporting data,[8] the results for several samples were qualified using flags (Attachment 5); however, none of the analytical results were rejected. See Section 3.3.1, Section 3.4, and Attachment 5 for additional details.

3.3 Data Precision

Data precision is a quantitative measure of the variability of a group or data compared to their average value. Precision is stated in terms of relative percent difference (RPD) for pairs of data or relative standard deviation for larger groups of data. Below is a discussion of the data precision evaluation conducted on the confirmation wipe samples collected.

[8] The data validation reports indicate that the required laboratory analytical QC samples analyzed for each batch of samples align with Worksheet #28 of the UFP-QAPP.

3.3.1 Laboratory Duplicate Samples

A summary of laboratory duplicate samples is presented in Table 4.

Table 4 Laboratory Duplicate Sample Summary

Laboratory QC Sample	No. of Lab QC Samples Analyzed	MPC	No. of Lab QC Samples Exceeding MPC	Percentage of Laboratory QC Samples that Exceeded the MPC
LCS/LCSD - Lead	13	RPD ≤20%	0	0%
LCS/LCSD - PCB	10	RPD ≤20%	1	10%

Notes:
LCS: Laboratory Control Spike
LCSD: Laboratory Control Spike Duplicate

Laboratory duplicate samples were analyzed at the required frequency outlined in the Worksheet #28 of the UFP-QAPP (i.e., at least one laboratory control spike [LCS]/laboratory control spike duplicate [LCSD] pair per 20 samples or per batch if less than 20 samples). All of the lead duplicate sample pairs met the Measurement Performance Criteria (MPC) outlined in the UFP-QAPP.

Of the PCB laboratory duplicate sample pairs, the RPD for Aroclor 1016 in one sample pair did not meet the MPC of having an RPD ≤20 percent. As a result, data qualifiers (i.e., "UJ" flags) were applied to Aroclor 1016, 1221, and 1232 results for the confirmation wipe samples associated with this lab QC sample (i.e., all PCB samples from SDG# 465031 and 465035). While the variability in the laboratory's precision for Aroclor 1016 was greater than the MPC in the one LCS/LCSD sample pair (i.e., 10 percent of the LCS/LCSD sample pairs), this variability did not adversely affect the confirmation wipe sampling data as no Aroclors were not reported at concentrations above the laboratory analytical reporting limit (i.e., 1.0 µg/100 cm^2) in any of the confirmation wipe samples associated with these LCS/LCSD results.

3.3.2 Field Duplicate Samples

A summary of field duplicate samples is provided in Table 5.

Table 5 Field Duplicate Sample Summary

Analyte – Sample Type	No. of Field Duplicate Samples Collected	MPC	No. of Field Duplicate Samples in Exceedance of the MPC	Percentage of Field Duplicate Samples that Exceeded the MPC
Lead – Wipe	10 [a]	RPD ≤100%	1	10% [b]
PCB – Wipe	10	RPD ≤100%	-- [b]	-- [b]

Notes:
[a] Original field duplicate wipe samples from areas that were re-abated and re-sampled are not included in the total number of field duplicate samples collected.
[b] In accordance with the UFP-QAPP, RPDs were not calculated for duplicate samples where the analyte is less than the QL in one or both samples.

PCBs were not detected above laboratory QLs in any of the duplicate samples collected and as a result, RPDs could not be calculated.

The lead field duplicate samples met the MPC outlined in the UFP-QAPP for 9 of the 10 field sample pairs (i.e., 90 percent); the agreement between results of the original sample and the duplicate sample indicate that the cleaning procedures used prior to sampling were implemented consistently throughout the abated area and that the field sampling was conducted in a reproducible manner. While RPD for the field duplicate sample pair that exceeded the MPC was 117-percent, to be conservative, the highest of the duplicate sample pair results was used in the calculations of the 95-percent UCL.

3.4 Data Accuracy/Bias

Data bias may result from systematic analytical error and is evaluated based on laboratory spike results for routine QC samples prepared and analyzed by the analytical laboratory.[9] Data accuracy is a measure of the overall agreement with a known value and includes a combination of random error and systematic error, with both parameters potentially resulting from analytical error. Data accuracy is evaluated using laboratory QC samples.

3.4.1 Laboratory QC Samples

A summary of the laboratory QC samples is provided in Table 6.

Table 6 Laboratory QC Sample Summary

Laboratory QC Samples	No. of Samples Analyzed	MPC	No. of Samples Outside of the MPC	Percentage of Samples that do not meet MPC
Lead LCS and LCSD	26	%R 80-120%	0	0%
Lead Method Blank Samples	13	<QL	0	0%
PCB LCS and LCSD	20	%R 60-140%	1	5%
PCB Method Blank Samples	10	<QL	0	0%

All of the laboratory QC samples for lead confirmation wipe samples met the MPC outlined in the UFP-QAPP. One of the PCB laboratory QC samples (i.e., one LCSD sample with a recovery rate of 57-percent) was below the percent recovery (%R) MPC outlined in the UFP-QAPP. Low recoveries indicate that the reported results may be biased low. Nevertheless, based on the magnitude of the low LCSD recovery, the fact that the recovery for the LCS sample corresponding to the LCSD sample with low recovery was within the MPC, the fact that PCBs were not reported in any of the samples associated with this LCSD sample at concentrations above the laboratory analytical reporting limit of 1 µg/100 cm^2, and that the laboratory analytical reporting limit is two orders of magnitude lower than the Cleanup Goal for PCBs, it is unlikely that PCB concentrations in any of the samples associated with this LCSD sample exceeded the numerical Cleanup Goals. Data qualifiers (i.e., "UJ" flags) were applied to Aroclor 1016, 1221, and 1232 results in cases where low LCSD recovery was observed (i.e., all PCB samples from SDG# 465031 and 465035). "UJ" flags indicate the compound or analyte was analyzed but not detected and the sample detection limit is an estimated value.

A continuing calibration verification (CCV) standard is a mid-level standard analyzed during and/or at the end of an analytical batch. CCV verifies that the instrument has not drifted from the initial calibration response and is only assessed during the Stage 3 data validation process. The percent difference (%D) measured during CCV in one sample exceeded the MPC of ≤20% for Aroclors 1260, 1248, 1254, 1262, and 1268 (SDG# 467767, 467769, and 467771). Data qualifiers (i.e., "UJ" flags) were applied to the affected Aroclors for each sample where the %D exceeded the MPC of ≤20%, as shown in Attachment 2.

3.4.2 Laboratory Surrogate Spikes

PCB samples are spiked with two surrogates during analysis, Tetrachloro-m-xylene (TCMX) and Decachlorobiphenyl (DCB). The %R for both surrogates is recorded during analysis and indicates analytical method performance with each sample.

One of the PCB confirmation wipe samples (i.e., ARCH-C1E-EXT-3 TO 4-220721-WF) had a TCMX recovery higher than the laboratory defined limits. Additionally, six of the PCB confirmation wipe

[9]As indicated in the UFP-QAPP, matrix spike and matrix spike duplicate samples are not prepared and analyzed for wipe samples. .

samples (i.e., DOOR-N-0.5GW-EXT-9 TO 10-220721-CB, DOOR-N-0.8GE-DG-10 TO 24-220721-G, DOOR-N-0.1GE-PS-23-220721-LA, ARCH-C1E-EXT-3 TO 4-220721-WF, 220721-MEDBLANK, and ARCH-C1E-INT-2.5 TO 3.5-220721-WF) had a DCB recovery higher than the laboratory defined limits. High surrogate recovery indicates that the analytical results may be biased high. The fact that PCBs were not reported for the affected samples above the laboratory analytical reporting limit and that the laboratory analytical reporting limit is two orders of magnitude lower than the Cleanup Goal for PCBs, it is unlikely that PCB concentrations in the affected samples exceeded the numerical Cleanup Goals. No flags were applied to the affected samples.

Two PCB confirmation wipe samples (i.e., DOOR-N-0.3GW-DG-11 TO 25-220628-LA and DOOR-N-0.5GE-INT-25 TO 26-220628-CB) had a DCB recovery lower than the laboratory defined limits. Low surrogate recovery indicates that the analytical results may be biased low. The fact that PCBs were not reported for the affected sample above the laboratory analytical reporting limit and that the laboratory analytical reporting limit is two orders of magnitude lower than the Cleanup Goal for PCBs, it is unlikely that PCB concentrations in the affected samples exceeded the numerical Cleanup Goals. Data qualifiers (i.e., "UJ" flags) were applied to all Aroclor results in confirmation wipe samples with low surrogate recoveries (i.e., two samples from SDG# 465031).

3.4.3 Field QC Samples

A summary of the field media blank samples is provided in Table 7.

Table 7 Field QC Sample Summary

Laboratory QC Samples	No. of Samples Analyzed	MPC	Percentage of Samples that do not meet MPC
Lead Media Blank Samples	6	<QL	66.7%
PCB Media Blank Samples	6	<QL	0%

Lead was detected above the laboratory QL in four of the six media blank samples collected. As discussed in the Data Summary Submittal for the High Occupancy Area of Zone 1 (Rincon, 2023), the lead reported in the media blank samples is likely a result of low concentrations of lead dust that are known to be in the air following abatement and cleaning activities within the enclosures as opposed to lead contamination in the wipe sampling media.[10] A data qualifier (i.e., a "U" flag) was applied to one lead result that was less than 5-times the concentration of lead detected in the media blank sample (i.e., in the case of DOOR-N-0.4GE-PS-20-220822-G). PCBs were not detected above laboratory QLs in any of the media blank samples.

[10] Because lead was detected in personal air samples that were collected during NACE inspection and confirmation wipe sampling activities, it is understood that lead dust remains suspended in the air throughout such activities and is anticipated to contribute small to negligible concentrations of lead to confirmation wipe samples. NACE inspectors, Rincon, and any other trades that may enter the structure before it is pressure washed are required to wear half-face respirators with P100 filters, which protects these personnel from potential exposures to the residual concentrations of lead containing dust that may be present in the air within the enclosures.

3.5 Summary of Representativeness, Completeness, and Comparability

3.5.1 Representativeness

Representativeness is a qualitative measure that expresses the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at the sampling point, a process condition, or an environmental condition.

A field audit, which included a review of the field sampling protocols, was conducted on June 30, 2022. Sample collection and analysis was performed in compliance with the field and laboratory SOPs included in the UFP-QAPP for the collection and analysis of lead and PCB confirmation wipe samples. All confirmation wipe samples were analyzed within acceptable sample hold times and all field and laboratory personnel adhered to the appropriate sample handling and storage requirements outlined in the UFP-QAPP. The data are therefore considered representative of the samples collected.

3.5.2 Completeness

A summary of the completeness of the confirmation wipe samples is summarized in Table 8.

Table 8 Completeness for Confirmation Wipe Samples

Analyte – Sample Type	Total No. of Samples	Usable Results (%)	Unusable Results (%)	% Completeness - MPC
Lead – Wipe	102	100%	0%	>90%
PCB – Wipe	102	100%	0%	>90%

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the total number of measurements necessary to achieve Data Quality Objectives (DQOs) at a specified level of confidence. After data validation, the percent completeness is calculated by dividing the number of samples with valid data by the number of samples collected. Valid data includes both unqualified data that passes all QC criteria and qualified data that did not pass the QC criteria but was not flagged for rejection.

As described in Sections 3.3.1, 3.4.1, and 3.4.2, data qualifiers were applied to some of the data. These data qualifiers were determined not to affect the ability to compare confirmation wipe sample data to respective Cleanup Goals.

The data validation process did not result in the rejection of any confirmation wipe sampling data.

3.5.3 Comparability

Comparability is a qualitative term that expresses the confidence with which a data set can be compared with another. Data is considered comparable if quality assurance (QA)/QC measures, such as sample collection procedures, analytical methods, reporting units, and analytical reporting limits are equivalent for the samples within a data set. Adherence to QA/QC measures assures that samples collected in similar conditions (i.e., the low occupancy area of Zone 1) are comparable. Comparability criteria are met if, based on data validation, the sample collection and analytical procedures are determined to have been followed, or variations in sample collection and analytical procedures were deemed to not have resulted in sample results being rejected.

To ensure comparability of the data generated for the low occupancy area of Zone 1, sample collection and analytical procedures adhered to the requirements outlined in the UFP-QAPP. Based on the field audit conducted on June 30, 2022, as well as regular reviews of field forms and chain-of-custody forms, it was determined that field activities, including confirmation wipe sampling activities, were conducted in accordance with the NTCRA Work Plan as well as SOPs developed for field activities associated with the NTCRA.

As described in the Data Summary Submittal for the High Occupancy Area of Zone 1 (Rincon, 2023) the Project Team noticed that the extraction method that had been used for PCB confirmation and clearance wipe samples collected from the high and low occupancy areas of Zone 1 was a different method than the extraction methods included in the UFP-QAPP and the UFP-QAPP Attachment D-2. The team worked with Enthalpy Analytical, LLC (Enthalpy) to demonstrate that the extraction method used was capable of meeting the Project Cleanup Goals. Rincon prepared the memorandum, *PCB Wipe Extraction Method Used on NTCRA Samples Collected Before November 16, 2022* (PCB Memorandum), dated December 23, 2022, and submitted it to the Agencies. In an email correspondence dated January 24, 2023, the EPA acknowledged the completion of their review of the PCB Memorandum. As stated in the email correspondence, the EPA concurred with the conclusions presented in the PCB Memorandum and has no further questions or concerns regarding PCB wipe extraction methods. The PCB Memorandum and revised UFP-QAPP pages were included as attachments to the Zone 1 High Occupancy Data Summary Submittal (Rincon, 2023).

While reporting limits for the majority of lead and PCB confirmation wipe samples collected in the low occupancy area of Zone 1 exceeded the laboratory specific QL outlined in Worksheet #15 of the UFP-QAPP, the difference between laboratory specific QLs was determined to not affect the quality of the data. See Section 3.6 for additional details.

3.6 Sensitivity

A summary of the sensitivity for the confirmation wipe samples is summarized in Table 9.

Table 9 Sensitivity Comparison for Confirmation Wipe Samples

Analyte	Method	Cleanup Goal	Laboratory Specific QL in UFP-QAPP	Maximum QL Reported
Lead	U.S. EPA Method 3050M/6010B	<250 µg/ft^2	0.5 µg/ft^2	1 µg/ft^2
PCB	U.S. EPA Method 8082	≤100 µg/100 cm^2	0.5 µg/100 cm^2	1 µg/100 cm^2

Sensitivity is the capability of a method or instrument to discriminate among measurement responses representing different levels of the variable of interest. The laboratory specific QLs outlined in the UFP-QAPP were 0.5 µg/ft^2 for lead and 0.5 µg/100 cm^2 for PCBs. However, the reporting limits for the majority of the PCB and lead confirmation wipe samples exceeded the laboratory specific QLs as identified in the UFP-QAPP. However, the highest reported QLs for lead and PCBs were below the numerical Cleanup Goals and, as a result, the sensitivity of the methods was sufficient for comparison of sample results to numerical Cleanup Goals.

While the QL achieved for the samples collected in the low occupancy area of Zone 1 exceeded the QLs specified in the UFP-QAPP, Rincon and Enthalpy have worked to resolve the issue and the QLs specified in the UFP-QAPP were achieved for all samples collected after October 7, 2022.

4 Clearance Wipe Sampling Results

On completion of the abatement, cleaning, inspection, sampling, and priming activities within each enclosure, the abated steel, scaffolding, and enclosure material were cleaned by pressure washing with potable/recycled water. The purpose of this cleaning was to decontaminate the space such that follow-on trades are able to work in a decontaminated work environment.

In accordance with the UFP-QAPP, following pressure washing activities, clearance wipe samples were collected[11] from the decontaminated surfaces and analyzed for PCBs and lead to demonstrate that the contents of each enclosure had been adequately cleaned and that PCBs and lead were not present at concentrations in exceedance of the Clearance Goals (i.e., <250 µg/ft^2 for lead and ≤10 µg/100 cm^2 for PCBs).

Rincon conducted a review of laboratory analytical reports for the clearance wipe samples collected in Zone 1. The data review process included:

- Review of field records, including field data sheets, chain-of-custody forms, relevant correspondence, change orders and deviations, and field corrective action reports; and,
- Review of the analytical data package, including cover sheet, case narrative, sample receipt record, sample chronology, communication record, analytical results, definition of laboratory qualifiers, results reporting form, QC sample results, corrective action reports, and electronic data deliverables.

The tabulated results and final analytical laboratory reports for the clearance wipe samples collected in Zone 1 are presented in Attachment 6. The average lead clearance sampling results for Enclosure A, B, C, and D are 55, 59, 138, and 181 µg/ft^2, respectively. PCBs were not detected above the laboratory QL (i.e., 1.0 µg/cm^2) in any of clearance wipe samples.

Flags were applied to clearance wipe sample results based on Rincon's review of the analytical reports. "UJ" flags were applied to results for three PCB sample results where high surrogate recoveries were observed, and to 11 PCB sample results where low surrogate recoveries were observed. While surrogate recoveries were outside of the acceptable recovery ranges, the recoveries were not within ranges that would warrant rejection.[12] In addition, "b" flags were applied to 12 lead sample results due to high recoveries in interference check standards; however, these recoveries did not have any impact on data quality.[13] Lastly, data qualifiers (i.e., "U" flags) were applied to six lead results that were less than 5-times the concentration of lead detected in the media blank sample collected from within the same enclosure.

Based on this review, the clearance sampling data are considered suitable to assess whether the average concentrations of lead and PCBs in the clearance wipe samples are less than the numerical Clearance Goals.

In accordance with Worksheet #17 of the UFP-QAPP, the average concentration of PCBs and lead in the clearance wipe samples were compared with the Clearance Goals. As the averages of the clearance

[11] Clearance wipe samples from Enclosures A, B, and C were collected from both the high and low occupancy areas of the enclosures.

[12] Percent recoveries that would warrant rejection are those with recoveries below 10-percent.

[13] High recoveries were reported for aluminum in the interference check standards resulting in a "b" flag applied to select sample results. While high aluminum recoveries in interference check standards may indicate that lead concentrations in sample results could be biased high, Enthalpy's lead analyst reported that aluminum recoveries were not similarly high in the results that were associated with the clearance samples. Therefore, the potential for high bias is not applicable to the clearance sample results and the interference check standard did not have a material effect on the data quality.

sampling results for the cleaned scaffolding, structural steel, and enclosure materials were below the Clearance Goals of ≤10 µg/100 cm^2 for PCBs and <250 µg/ft^2 for lead, these materials were adequately decontaminated, and no additional decontamination was required for the four enclosures within Zone 1.

Acronyms and Abbreviations:

NTCRA: Non-Time-Critical Removal Action

PCBs: polychlorinated biphenyls

µg/100 cm^2: micrograms per 100 square centimeters

µg/ft^2: micrograms per square foot

U: Indicates the compound or analyte was analyzed for but not detected.

UCL: Upper Confidence Limit

UFP-QAPP: Uniform Federal Policy Quality Assurance Project Plan

UJ: Indicates the compound or analyte was analyzed but not detected. The sample detection limit is an estimated value.

U.S. EPA: United States Environmental Protection Agency

-- : Not analyzed/not applicable.

Notes:

The 95-percent UCL was calculated using Version 5.2 of the ProUCL program published by the U.S. EPA. The highest of the recommended UCL is presented in this table. The 95-percent UCL output file is presented in Attachment 4.

[a] Location ID corresponds to the Field ID in the Laboratory Analytical Reports.

[b] The lower result of each duplicate sample pair collected was not included in the calculation of the 95-percent UCL.

[c] The indicated location was re-abated and re-sampled. The original confirmation sampling result at locations that were re-abated and re-sampled was not included in the calculation of the 95-percent UCL.

[d] The indicated sample is the duplicate sample for the original sample collected at location DOOR-N-0.9GW-EXT-9 TO 10-220721-CB.

[e] The 95-percent UCL for PCBs is the maximum of the analytical reporting limits for each Aroclor as the 95-percent UCL could not be calculated because PCBs were not detected in any of the PCB samples.

Bolded values indicate constituents detected above laboratory quantitation limits.

Shaded values indicate constituents detected above Cleanup Goal.

~~Strikethrough~~ text represents sample locations that were re-abated and subsequently re-sampled. Only the final confirmation sample results were used in the calculation of the 95-percent UCL of the mean concentration.
